FREE BE A CERTIFICATED ELECTRICIAN

YOU MEN LISTEN The country needs more trained, graduate electricians. Thousands have gone into the Government service and there is such an unusual demand for competent electrical men that I am making a wonderful offer at this time. HERE IS YOUR OPPORTUNITY! I want to send you my splendid offer now.

Don't hesitate because of age or experience. Young men, boys and old men must now fill the gaps and keep business going. DO YOUR PART. Prepare yourself for a real position, by my **Home Study Course** in *Practical* Electricity. I am Chief Engineer of the Chicago Engineering Works. I have trained thousands of men and can help you better than anybody else. We also have large, splendidly-equipped shops where you can come at any time for special instruction without charge. No other correspondence school can give you this.

SPECIAL OFFER: Right now I am giving a big, valuable surprise that I cannot explain here, to every student who answers this ad. Write today!

$46.00 to $100.00 a Week

Go after some real money. Qualify for one of the thousands of splendid positions open. All you need to start is a few months snappy, *practical* instruction from a competent engineer. Come to me—*NOW*. I'll give you my personal care to ensure rapid and efficient progress. My course is intensely practical. It is highly condensed, simplified, up-to-date and complete. I am so sure you will make a splendid success in this study, that I will *Guarantee Under Bond* to return to you every cent paid for tuition, if you are not entirely satisfied when you receive your Electrician's Certificate granted you as a graduate of my school.

FREE—Lessons and Outfit—FREE

Send me the Free Outfit Coupon at once. Do it *now!* For a limited period I am making a slashing cut in the cost of tuition, and giving each new student a grand outfit of Electrical Tools, Material and Instruments—in addition—*Absolutely Free.* I will also send you—free and fully prepaid—Proof Lessons to show you how easily you can be trained at home to enter this great profession, by means of my new, revised and original system of mail instruction.

Use this "Free Outfit" Coupon

CHIEF ENG. COOKE, Dept. 21
441 Cass St., CHICAGO, ILL.

SIR Send at once—fully prepaid and entirely free—complete particulars of your great offer for this month.

Bigger Pay for YOU

"See them first-pay afterwards"

Small Monthly Payment if you're satisfied

You Can Now Know ELECTRICITY

As Experts Know It

When we observe the ever-increasing applications and usages of electricity, we wonder if all the present openings and the newly created positions in the electrical world can ever be filled.

The ending of the war lends a new and mighty impetus to the electrical end of American industries. Salaries are soaring. There is practically no limit to the earning power of the man who educates himself in the finer points of electrical work.

Actual working facts

With the advent of the new Library of Practical Electricity, by Terrell Croft, a new era is marked in the production of self educational electrical literature. This library satisfies a demand never heretofore met—the demand for a home study course which would bring out in detail the actual working facts. This great undertaking has been accomplished. It is a seven-year task completed.

No previous electrical training necessary

Three thousand pages, with twenty-one hundred of the clearest illustrations ever put into book form. Each of the eight volumes is indexed so that everything you want to know about electricity is at the finger's end. And when you find what you want, there is not merely a short question and a short answer. You are told everything you want to know. The explanation is clear to you, regardless of whether you have had a previous knowledge of electricity or not.

Know electricity as the highest paid engineers know it

When you are studying the Croft Library of Practical Electricity, you are studying electricity as experts know it. You are acquainting yourself with the methods employed by the highest paid electrical workers and engineers in America.

This Library of eight volumes sent to you FREE for 10 days' trial

So positive are we that you will be pleased with the Croft Library of Practical Electricity that we offer to send the entire ten volumes for ten days' free use. All you need do in order to have the books sent, charges prepaid, is to fill out the attached coupon and return to us. Keep the books ten full days. Then if you are not satisfied, return them at our expense. On the other hand, if you find that they will help you, as they are helping thousands of others, send us the small sum of $2 per month for eight months.

A letter that means something to every man in America who is interested in electricity

McGraw-Hill Book Company, Inc.,
239 West 39th Street, New York, N. Y.
Gentlemen: In an attempt to express myself about CROFT'S NEW LIBRARY OF PRACTICAL ELECTRICITY, I have never seen and do not believe there was ever printed in the English language, a more comprehensive set of books. It is a library that is just as valuable to the novice as to the expert, because it is all practice.

Respectfully,
GUY H. PEIFER,
Chief, Doplan Silk Corporation, Hazleton, Pa.

Electric Music

THERE are many different ways of producing music, and as our culture advances the desire for better and still better music becomes a craving of civilization. From the ancient tom-tom to a Stradivarius violin is a long cry, and the chances are that as our musical tastes become more refined, still better instruments will become necessary and highly desirable.

There are few instruments giving a more mellow and a more "human" sound and quality of tone than a fine violin, but we have no hesitancy in saying that it should be possible to obtain still better results by electrical means. The field of purely electrical music has hardly been touched. Some years ago an American inventor produced the Telharmonium. This was one of the earliest and best attempts at pure electrical music. The Telharmonium was invented by Dr. Thaddeus Cahill and he used alternating current generators, each of a certain frequency; if a telephone receiver were connected in the circuit, the latter would give forth a certain very pure note. By using a switchboard arranged in the form of an organ keyboard, wonderful musical effects were produced.

Another more recent attempt was the pure electrical music discovered thru researches of Dr. Lee de Forest. He used his audion bulbs in connection with a telephone receiver, and obtained beautiful flute-like tones of the greatest purity. The two devices just described necessitated the use of a telephone receiver to translate the electrical impulses into sonorous vibrations, and this is a great disadvantage, for it ties us to a thin diafram, which in itself cannot produce the very purest tones obtainable. As one can readily understand, the limitations of a diafram are very great and while it is possible to obtain a single pure note, it is a different matter where several pure notes in different octaves are to be reproduced simultaneously.

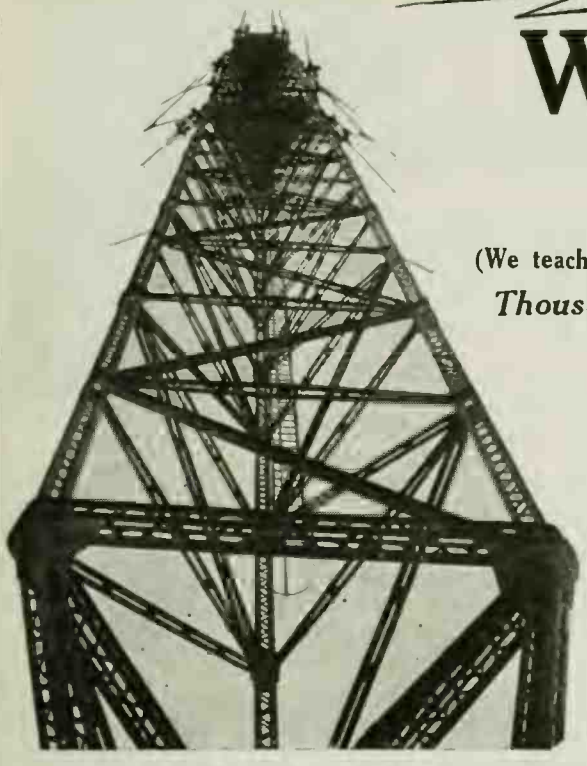
A way out is suggested by the writer by pressing into service the thermo-telephone which employs no diafram at all, but uses a very fine platinum wire of microscopic cross-section. This platinum wire, heating and cooling in unison with the electrical vibrations, imprest upon it imparts these impulses to the surrounding air. With this device very pure electrical music can be obtained.

There should be of course many other ways to actually produce pure electrical music, and here is a wonderful opportunity for experimenters and inventors. To the writer's mind, it seems not at all impossible that we should take a metallic wire stretched taut and by impressing an electric current upon it, vary its heating and cooling effects so as to produce pure sounds in a suitable receiver such as a thermo-telephone.

Dr. de Forest has shown us that beautiful music can be produced in a vacuum tube. Paradoxical as it seems, this nevertheless is a fact. There must be many other ways of producing vibrations in a vacuum tube which can be translated into an electrical current, thus producing music.

There are also certain ways of making electromagnets produce music—this without the adjunct of telephone receivers,—by vibrating their entire structure. Many other means will undoubtedly suggest themselves to our students and scientists.

H. GERNSBACK.



The ELECTRICAL EXPERIMENTER is publisht on the 15th of each month at 233 Fulton Street, New York. There are 12 numbers per year. Subscription price is $2.00 a year in U. S. and possessions. Canada and foreign countries, $2.50 a year. U. S. coin as well as U. S. stamps accepted (no foreign coins or stamps). Single copies, 20 cents each. A sample copy will be sent gratis on request. Checks and money orders should be drawn to order of EXPERIMENTER PUBLISHING CO., INC. If you change your address notify us promptly, in order that copies are not miscarried or lost. A green wrapper indicates expiration. No copies sent after expiration.

All communications and contributions to this journal should be address to: Editor, ELECTRICAL EXPERIMENTER, 233 Fulton Street, New York. Unaccepted contributions cannot be returned unless full postage has been included. ALL accepted contributions are paid for on publication. A special rate is paid for novel experiments; good photographs accompanying them are highly desirable.

ELECTRICAL EXPERIMENTER. Monthly. Entered as second-class matter at the New York Post Office under Act of Congress of March 3, 1879. Title registered U. S. Patent Office. Copyright, 1918, by E. P. Co., Inc., New York. The Contents of this magaine are copyrighted and must not be reproduced without giving full credit to the publication.

The ELECTRICAL EXPERIMENTER is for sale at all newsstands in the United States and Canada; also at Brentano's, 37 Avenue de l'Opera, Paris.

One of the giant wireless towers which keeps us in constant communication with Europe.

Wireless in Ten Weeks

(We teach you in your own home during your spare time)

Thousands of operators needed for America's Merchant Marine

The age of wireless is here. The experimental stage has passed. Wireless now equals in importance telegraphy, and telephony. It has assumed its place among the great commercial industries of the earth. So rapid has been the development and growth of wireless in recent years that there has been left in its wake a tremendous shortage of operators. Actually thousands upon thousands are now needed for permanent "peace time" positions offering wonderful opportunities for advancement.

Earn up to $200 per month

In the short period of ten weeks we can make of you a wireless operator, a man with a profession, independent, and not subject to the rise and fall of wages in the labor market. Salaries are as high as $200 per month. There is a position in the merchant marine, the army, the navy, or a land station, awaiting everyone completing our course. We give you this training at home, by mail, in your spare time. It is not necessary for you to lose any time from your work to take the course.

Free Instruments—

To every student enrolling with us we present a standard set of instruments with which wireless messages may be sent and received.

Travel the world over or locate at a land station in America.

America is spending billions of dollars on the mightiest navy and merchant marine in the world. Practically all vessels are being equipped with wireless apparatus of the most up to date type. Thousands of operators are needed now. The field affords a wonderful opportunity for the man who starts now to master wireless.

Our students actually pass the commercial examination in ten weeks or less.

Get your instruction from the Nation's Capitol. Our course is endorsed by officials of the U. S. Government.

The National Radio Institute, headed by authorities who have been closely allied with governmental training of students, has perfected an easily mastered course in wireless telegraphy whereby students are taught completely in ten weeks, either here in Washington at our large residence school or at home, by mail. Many of our students are ready to take up actual wireless work in much less time. The course is founded on actual practice, hence the rapid progress of the student.

NATIONAL RADIO INSTITUTE

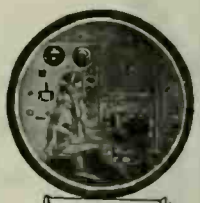
ELECTRICITY

Learn in New York



Learn by Doing

Master Electricity By Actual Practice

The only way you can become an expert is by doing the very work under competent instructors, which you will be called upon to do later on. In other words, *learn by doing.* That is the method of the New York Electrical School.

Five minutes of actual practice properly directed is worth more to a man than years and years of book study. Indeed, Actual Practice is the only training of value, and graduates of New York Electrical School have proved themselves to be the only men that are fully qualified to satisfy EVERY demand of the Electrical Profession.

DIRECT CURRENT PRACTICE

WIRELESS TELEGRAPHY

ALTERNATING CURRENT PRACTICE

ELECTRICAL DRAFTING

ELECTRICAL REPAIRS

TELEPHONE INSTALLATION

The Oldest and Only Institution of the Kind in America

At this "Learn by Doing" School a man acquires the art of Electrical Drafting; the best business method and experience in Electrical Contracting, together with the skill to install, operate and maintain all systems for producing, transmitting and using electricity. A school for Old and Young. Individual instruction.

Over 5,000 Students now holding Successful Positions in the Electrical World

5,000 of our students are today successful electricians.

No previous knowledge of electricity, mechanics or mathematics is necessary to take this electrical course. You can begin the course now and by steady application prepare yourself in a short time. You will be taught by practical electrical experts with actual apparatus, under actual conditions.

Let us explain this course to you in person. If you can't call, send now for 64-page book—it's FREE to you.

American Destroyers Throw "Depth Bomb Barrage"

AN American destroyer, with her depth bombs ready to be discharged, is a dangerous craft. Running without lights in the darkness she is a menace not only to the enemy but to herself and other ships should a collision occur.

time. The arrangement of the American destroyer's depth bomb armament that struck terror into the heart of German submarine commanders is shown in the accompanying illustration. These depth charges are dangerous to a submarine, even if they are 500 to 1200 feet away from the

square inch for every foot of head or depth. Thus for 1 foot depth the hydrostatic pressure acting on the shell, and also the diafram, would be .433 lb. for every sq. in. of surface area. For a depth of 20 ft. the water-pressure per sq. in. would be 8.6 lb.; for 50 ft. depth, 21.6 lb., and

Copyright, 1918, by E. P. Co.

U. S. Destroyers Have Greatly Profited By Actual War Experience, for They Became So Proficient In the Use of the "Depth Bomb"—a Wonderful New Weapon In Itself—That They Could Set Up a Veritable "Sub-aqueous Barrage." Also They Can "Shoot" Depth Bombs for a Distance of One-half Mile or More. Unlike Shells They Do Not Ricochet or Slip, But Penetrate the Water to a Certain Depth and Then Explode.

The bombs are now released from every quarter of the destroyer. Two can be dropt from the bridge by pressure of a button; "Y guns," amidships, with two barrels, can throw bombs to port or starboard; astern there are two long lines of bombs running on miniature railway tracks, so a complete *barrage* may be fired at any point where the subaqueous explosion occurs.

The detail view herewith of one of these depth bombs shows clearly the principle upon which they operate. The steel tank container is a simple affair, fitted with a sensitive water-pressure diafram. The pressure of the water increases .433 lb. per for 100 ft. depth, 43.3 lb. per sq. in. Hence it is clear how it becomes possible to "set" the diafram of the detonating device, whether electrical or mechanical, to trip off the latter at any desired depth. The farther the contact pin, or trip finger, is set back or away from the diafram, the greater the water-pressure or depth required to press it in that far.

www.americanradiohistory.com

AND NOW THE ELECTRICIANETTE!

We have conductorettes, female bartenders, police women, elevator operators, usherettes and farmerettes, but this is the first instance of its kind where we are having an electricianette.

Mrs. Ada B. Vail of the Atlantic City Electric Company, Atlantic City, New Jersey, has complete charge of an installation of sixty-five electric ranges in one apartment house located at the above address. She is responsible for the proper maintenance and operation of the entire equipment of these stoves and handles her position capably. Beside, she takes care of some thirty-five odd electric stoves thruout the city. In all, she supervises one hundred of these intricate electrical devices.

Her entire tool kit can be summed up into a testing lamp, screw driver and two pair of pliers, one large and one small. Compare this neat and compact equipment that most certainly reflects the characteristics of a *woman* as its owner, with the *modest* (?) tool *chest* of the male species of electrician and the carrying of a large assortment of unnecessary junk, approximating one-half ton in weight, and when he finds that the job will require a screw driver one-sixteenth of an inch smaller in size, we would be asking too much if we should expect him to use one of the next size. Instead he takes an afternoon's vacation on your time, going to the movies or to Coney Island, or Kalamazoo, as far as we know, and by the length of time that he consumes to get this tool.

Can you imagine upon arising from your warm bed on a cold Winter morning, making a quick dash to the electric stove in the sitting room, turning on the switch, and in anticipation of the warmth that you are to get, you find the electric stove is as cold as a chunk of ice. The heat of your indignations warms you thoroly, and you make one grand dive for the telephone. After you have stood there for about a half hour with your teeth chattering, waiting for the telephone boy in the hall below to answer your call, you are finally rewarded for your patience by being allowed the honor to speak with the janitor. After you have told him what you thought of him and his entire family, back to his great, great, great grandfather, he very sweetly answers with a roar like the Kaiser; and tells you that your need will be attended to.

Within a few seconds you hear a short stacatto knock upon the door, and upon opening it you are almost stricken speechless by the appearance of a very neat and chicly attired young lady, in *over-alls*. Taken back with this surprise, you ask her what she desires. "Oh, Sir," says she, "I am the *electrician!* You sent a call for me, and I am here to repair your heater." Her intention is very agreeable to you, and with military precision she brushes past you, takes off the top of the heater, yanks out the heating elements, mutters a monosyllable that sounds like "burnt out," inserts a new unit, attaches another fuse, turns the switch, and the job is finished. It has taken her exactly ten minutes, and the most incredible part of it, when you ask her the charges, and receive a reply, "Oh, that is all right, sir, I am paid by the firm that owns the building." She goes out closing the door very gently, and without even looking for a tip.

Cheer up, fellows, it will be a great old world after the fair sex take our jobs. We will have nothing to worry about except washing the dishes and scrubbing the floor.

Photo Courtesy Edison Electric Illuminating Co. of Boston

Yes, the "Electriclanettes" Are Here! The Present Photo Shows Them Hard at Work at One of the Dynamo Switch-Boards of the Boston Edison Company

WORLD RADIO SYSTEM URGED FOR SOCIALISTS.

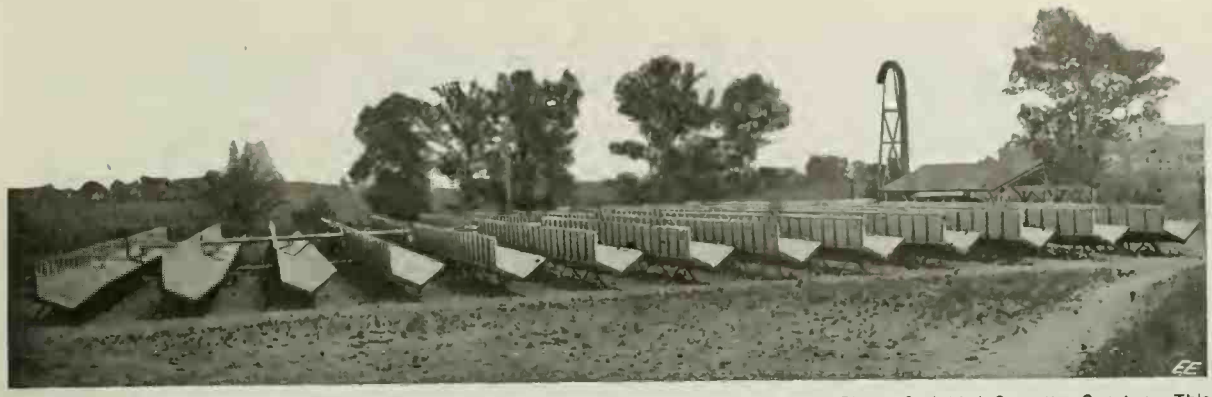
Active steps are being taken by the International Socialist movement to establish a private system of wireless thruout the world. Five installations are now definitely projected. Stations will be immediately set up in England, France, Belgium and ultimately in other countries, including America.

Three of the new stations will link up with the German and possibly the Russian Socialist wireless. They will be used to connect Socialist organs in various countries.

In collision there is no danger of the shock exploding the bomb, but some might be thrown into the water and explode when at the proper depth.

And this is not all of the Depth Bomb's story, either. Did you ever hear of the depth bomb "gun"? It *shoots* depth bombs accurately for a distance of half a mile or more. The merchant ships that dodged the U-boats were equipt with such guns, which operate with comprest air, similar to the well-known torpedo tube. The illustration shows how the depth bomb gun is sighted to drop the bomb just at the point where it will complete its trajectory thru the water and explode near the enemy submarine, which has submerged and is sneaking off, or trying to.

Imagine also the effect of a subaqueous barrage on the enemy subsea fighters. Talk about land barrage fire! The water transmits the noise and vibrations from the exploding depth bomb many times better than in the air. Cases have been known where a submarine's plates have been dented in and the seams started at a distance of nearly one-half mile. The concussive wave transmitted thru the water is exceedingly powerful because, for one reason, water is practically incompressible.



Remembering that stores of mutinies in the German naval ports first gave clear intimations that Germany's military machine was breaking down, it is not surprising that the revolutionary movement first should have assumed serious form among the sailors. And according to the current reports, the terrible hardships and the ghastly number of fatalities among the U-boat crews are what started the final fatal break in discipline and morale.

It can be said, therefore, with some approximation to truth, that not only did unrestricted undersea warfare hasten and make certain the defeat of Germany by bringing into the war the American land and water forces needed to turn the scale against her, but it was the thing which, working from the other side, added speed to the downfall of the Kaiser's hopes and his empire. The fears and the despairs which the submarines could not create in the minds of the Allies they did create in those of the men who had been ordered to commit the atrocious crimes by which the world was shocked.

They did what they were told to do, but the task proved too much for even their docility, and they rebelled against it at last, not, however, so far as any evidence yet presented has shown, because of indignation against the orders received, but because the execution of those orders so often meant for them the fate of drowning rats. Too many of the U-boats that went out did not return, and the mystery of their fate was intolerable to the survivors.

BACK NUMBERS!—Many readers desire to obtain back numbers of this journal. We have a limited quantity of these back issues on hand and can supply them at the following rates:—Back numbers of The Electrical Experimenter not over three months old, 15 cents each; over three months old, 20 cents each; over one year old, 35 cents each.

Some Day In the Near Future We Shall Undoubtedly See Hundreds of These Solar Energy Plants Sprinkled Over the Country. This Large Plant Is In Texas. The Mirrors Reflect the Sun's Rays Onto Special Boilers, the Steam Produced Running a Steam Engine, Connected to a Dynamo. Current From the Dynamo Runs a Motor Pump Which Lifts Water to a Height of Sixty Feet.

Solar Engine Uses Sun's Energy

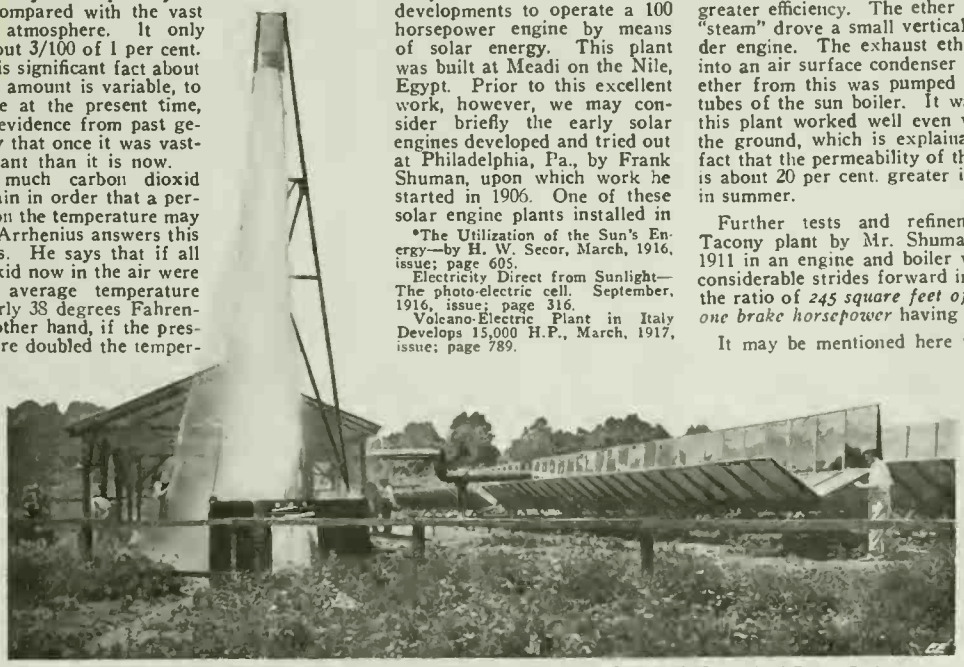
SIX thousand degrees Centigrade is the computed temperature of the sun. Its light giving power is equal to 27,000,000,000 candlepower, a quarter of a mile away. Scientists tell us that only the 2,735-millionth part of the total energy radiated from the sun reaches our earth, but if this were ever caused to stop for any reason our planet would turn into a dead, frigid ball of rock; the present average annual temperature of 13° C., would change, without the heat of the sun, to 73° C., of frost, it is calculated.

Experiments show that the power of the atmosphere to trap heat is largely due to the *water vapor* that it contains. It is also due to some extent, to the *carbon dioxid gas* that is one of its minor constituents, points out Prof. Garrett P. Serviss. Carbon dioxid is a remarkable heat retainer, but there is only a very small quantity of it in the air compared with the vast bulk of the atmosphere. It only amounts to about 3/100 of 1 per cent. But there is this significant fact about it, viz., that its amount is variable, to a slight degree at the present time, while there is evidence from past geological history that once it was vastly more abundant than it is now.

Now, how much carbon dioxid must the air gain in order that a perceptible effect on the temperature may be produced? Arrhenius answers this question for us. He says that if all the carbon dioxid now in the air were removed, the average temperature would fall nearly 38 degrees Fahrenheit. On the other hand, if the present amount were doubled the temperature would rise more than 7 degrees, and if it were quadrupled the rise would amount to nearly 14½ degrees which would be far more than enough to banish all the glacial suffering that we had to endure last winter. Even the smaller amount of increase (7 degrees) would probably suffice for that.

These facts are very interesting from a technical point of view, indeed. The practical aspect of solar energy lies at present in the hands of those who are endeavoring to perfect a solar motor—i.e., an engine or electric generating device which, when the sun's rays strike it, will develop steam to operate a steam engine, or electricity to charge electric accumulators or storage batteries. Those interested in this branch of science will find of great interest several articles which have appeared in back numbers of this journal.*

Considering later developments of a practical nature in the line of solar engines and boilers, we may take up the work of Mr. Shuman, of Philadelphia, Pa., who later collaborated with a Mr. Boys, of England. They were able in their final developments to operate a 100 horsepower engine by means of solar energy. This plant was built at Meadi on the Nile, Egypt. Prior to this excellent work, however, we may consider briefly the early solar engines developed and tried out at Philadelphia, Pa., by Frank Shuman, upon which work he started in 1906. One of these solar engine plants installed in Texas being illustrated herewith. The heat of the sun's rays strikes a large number of mirrors, which reflect the heat to special boilers. These produce steam to run an engine, the latter operating an electric dynamo. The current thus produced was capable of operating an electric motor pump which pumped water to a height of 60 feet above the ground.



Mr. Shuman had running at Tacony, Pa., a practical plant of this type, which developed about 3½ horsepower by using 1,200 square feet of sunshine that was allowed to fall on a fixt horizontal water box. This box was fitted with a glass top and a series of parallel horizontal black pipes were immersed in the water. These pipes, containing *ether*, exposed 900 square feet of surface to the solar radiation. The water also became heated and carried the heat to the underside of the pipes, thus realizing a greater efficiency. The ether boiled and its "steam" drove a small vertical, single cylinder engine. The exhaust ether vapor past into an air surface condenser and the liquid ether from this was pumped back into the tubes of the sun boiler. It was found that this plant worked well even with snow on the ground, which is explainable from the fact that the permeability of the atmosphere is about 20 per cent. greater in winter than in summer.

Further tests and refinements to the Tacony plant by Mr. Shuman resulted in 1911 in an engine and boiler which showed considerable strides forward in their design, the ratio of *245 square feet of sunshine per one brake horsepower* having been attained.

It may be mentioned here that the pipes constituting the sun boilers have invariably been *blackened*. For low temperatures lampblack has been used as the absorber, but where high temperatures were required platinum black was used.

Electric Death Traps in Hun's Retreat

By H. WINFIELD SECOR

IF you have any doubt that the Teuton is possest of a cunning mind, then you have but to read the reports that have come back to us every now and then from various reliable sources on the battle-fields of Europe, where the Allied troops have always had to contend with multifarious and indescribable forms of deadly and inhuman offensive schemes, such as liquid fire and gas, which horribly mutilates and disfigures its victims in thousands of cases. The Allies were never sure of what they might expect when they advanced on enemy territory. The Huns resorted to every possible underhand scheme their wily brains could think of in a desperate effort to spread terror among the Allied soldiers, and some of the despicable "traps" they have used, not to mention hundreds of others which we have not the space here to describe, are illustrated herewith.

Fig. 1 shows how the Germans often mined the town pump, or any other pumps on which they could operate, so that when a thirsty Allied soldier endeavored to draw some water, he would be instantly killed by a charge of explosive set off by an electric contact and battery inside the pump, the fuse circuit being closed on the first downward stroke of the pump handle. Of course, hundreds of mechanical traps were used, as well as electrical ones. The electric trap which has been extensively used in these operations is a simple affair, and comprises nothing more than a small dry or other battery, together with a pair of electric contacts arranged to be closed by the movement of some piece of furniture, et cetera, and a piece of fine fuse wire which is placed in the explosive. When the circuit is closed, the fine piece of wire melts, and the heat produced detonates the explosive. Some times the contacts are caused to close a battery circuit thru a spark coil, the secondary circuit of which is connected up with a spark plug, buried in the explosive. There are, of course, numerous other schemes, many of them having been provided with time clocks or switches, for delaying the explosion, as the official reports have frequently indicated.

The open fire place, which is ever a source of welcome to the footsore Doughboys when they have a chance to stop in a captured town, is not always the most healthy place in the world, for as Fig. 2 shows, it may contain a high explosive shell planted within the fire wall, so that when a good fire is kindled on the hearth the shell will be caused to explode, very possibly killing all those within the room.

Fig. 3 illustrates how the retreating Germans often left a trap for the conquering troops of the enemy by placing high explosive mines under the trails of cannon and machine guns, so that as soon as anyone moved the cannon carriage, the spring actuated pin of the mine would spring up and detonate the explosive, thereby possibly killing several men.

One of the cleverest, altho hellish, tricks ever played by the retreating Teutonic hosts probably is that of the "wireless bomb." Fig. 4 shows this trap in action, and the story of its operation is as follows: Before the enemy retreated, he took care to place a number of wirelessly operated bombs in the walls or possibly under the floor of various dwellings and other buildings, so that in the event the victorious troops as they entered the town or locality, might set up a wireless set in proximity to one of the bombs, the first spark would cause the bomb to explode with death-dealing violence. The bomb in this case is detonated by an electric fuse or spark circuit, actuated by a radio coherer and relay, or other similar radio receptor apparatus.

"Say, Hen," sang out a jolly faced Doughboy to one of his "buddies," as they sat about a table enjoying the mid-day meal of "Boston baked" and canned sardines a la *Rhine* in an old French chateau, "there's a telephone on the wall, why don't you call up your best girl," and full of Yankee play spirit the Doughboy arose. But something seemed to tell him not to touch the telephone instrument, and it was well that he did not; for one of the party, who had been cautioned by the intelligence officers to be extremely careful of touching anything in the captured territory until it had been carefully examined ascertained that the telephone instrument contained several pounds of explosive which was connected up with an electrical igniter attached to the switch-hook, so that as soon as the receiver was lifted from the hook, the explosive would be detonated, and so the story rolls on—backed by the facts. See Fig. 5.

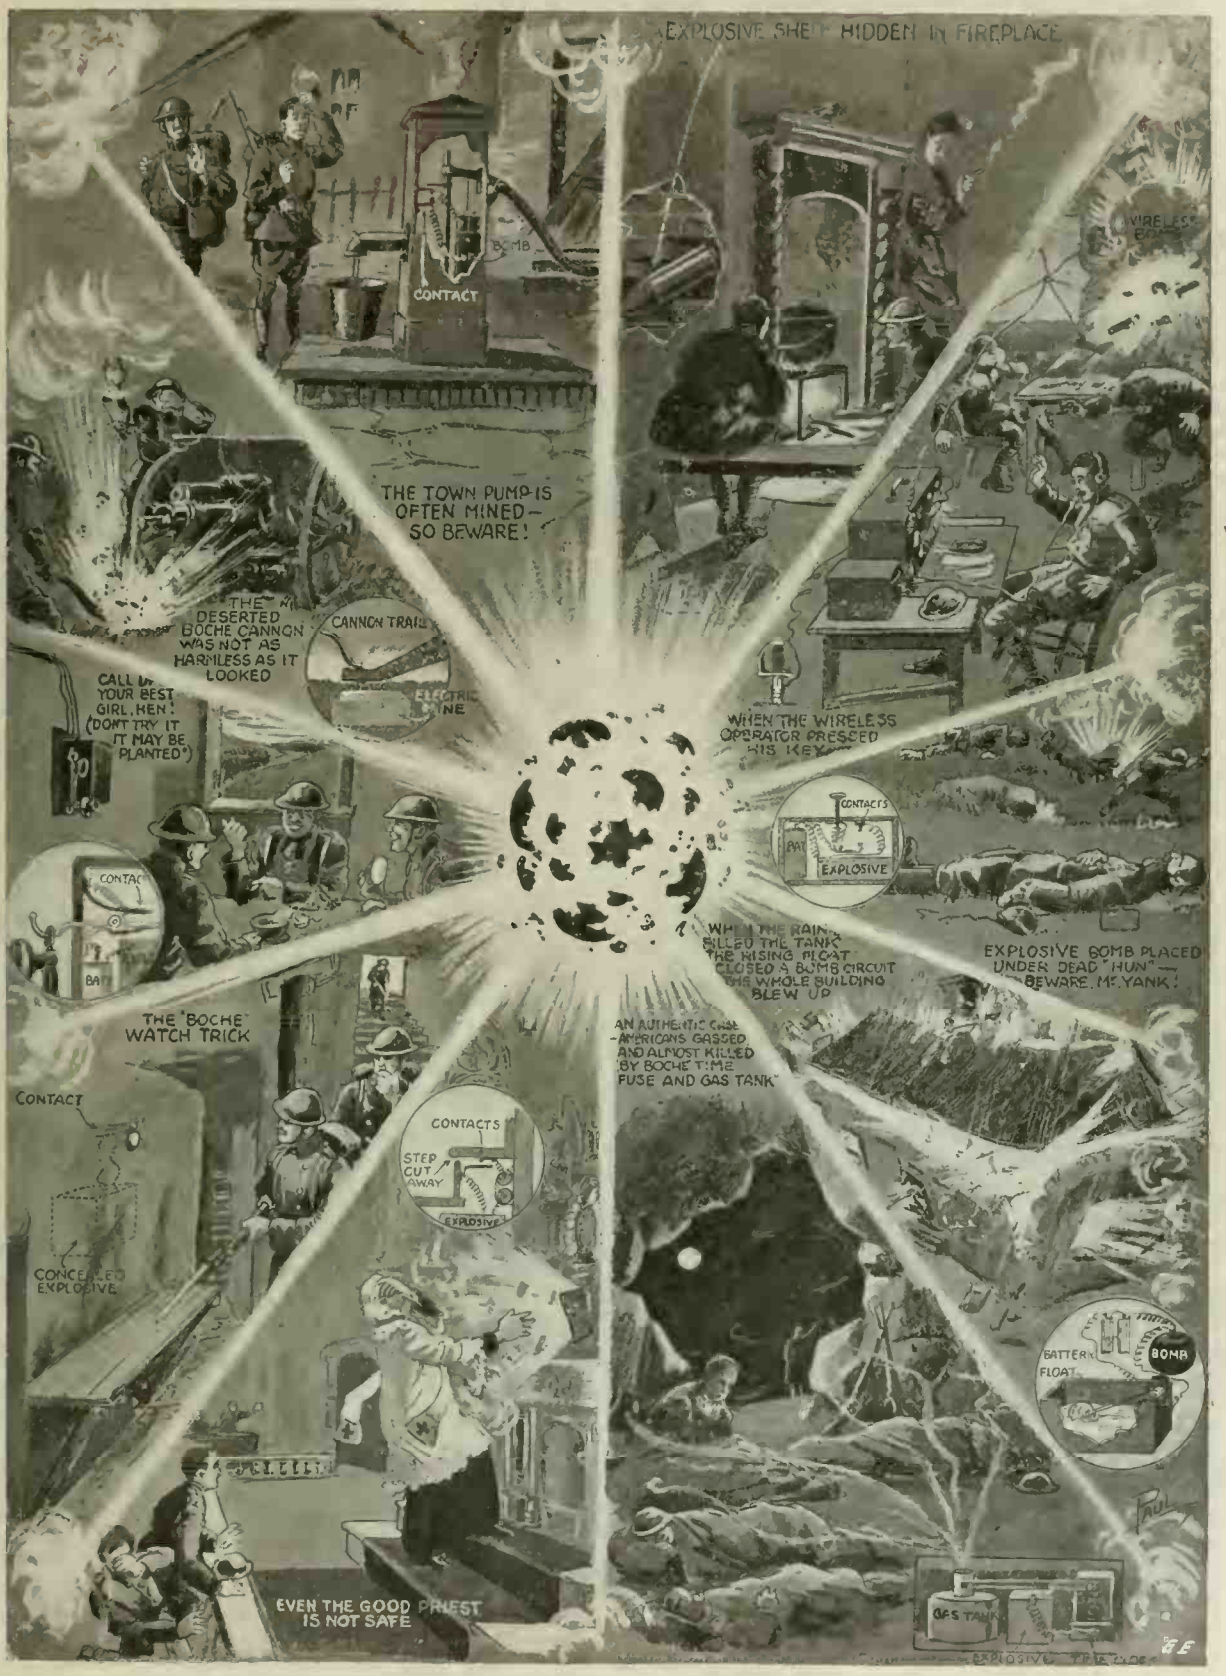
Nor were the German dead allowed to rest in peace, for even after life had ceased in their bodies, they must serve the "Fatherland." This is true *"Schrecklichkeit"* efficiency to the Teutonic mind, if not to ours. So the crafty Teutons, when they were forced to retreat, got into the habit of planting small explosive traps under the dead bodies, with the hope in their hearts that when the on-marching Yankees or Poilus got on this territory and attempted to clear it up by lifting the dead bodies, they would meet with unexpected fatalities. See Fig. 6.

In Fig. 7 there is shown the famous German "watch trick." This trick used to be pulled quite often at various points along the battle-line until the Allied troops got so skittish of all such devices that they would not touch anything with their hands, but would poke it with a stick, which invariably caused one of these death-dealing traps to explode harmlessly. In the watch trick, a favorite setting was in a trench or dug-out from which the Teutons had been forced to retire, and when the Allied soldiers had taken the trench, one of them would probably be surprised to see a perfectly good watch hanging on a nail or stick projecting from the trench wall and ticking away merrily. Now who would refuse to take such a watch? But many a brave soldier has undoubtedly lost his life by thinking just that way, and the moment the watch was removed from the nail or other projection from which it hung, this act caused a high explosive trap to detonate.



And the churches—what haven't the Teutonic sons of the mailed fist done to these! One case which happened in Belgium comes to mind where a number of Allied soldiers were endeavoring to hold church in a captured town. The priest had no sooner started to ascend the steps of the altar, when a terrific explosion occurred, which demolished the alter and seriously wounded the preacher. This trap utilized an electric contact spring arranged under the step, the riser of one of the steps being cut away so that when a person's weight rested on the tread, it would force it down a slight distance, closing a contact which detonated the bomb. See Fig. 8.

One of the most heinous and criminal death-dealing devices ever planted by the retreating Huns was recently witnest in actual operation by a New York soldier who came home not many months ago. To start with, the soldier who related this tale was a member of a Company which had been marching for several days, and one night when they prepared to rest and get some sleep they discovered a large cave. See Fig. 9. Naturally, unless the weather is quite warm, anyone would rather sleep in a cave than out in the open, for obvious reasons. And so they went to sleep, but long before morning several of the men awoke and were surprised to smell gas fumes, and, what was more astonishing, a large number of the men who were sleeping in the cave were found to be "gast." Those who had awakened, and who were not totally overcome by the gas, at once removed the gast men from the cave and started to investigate, as no fumes of gas had been noticed whatsoever on the previous evening when they had found the cave. "Dirty work, sure enough," said the Sergeant, as he and two of his men started back in the cave to find out what kind of a new trap the crafty Huns had concocted; before long they discovered it, planted several feet below the earth in the rear of the cave, and with a small gas tube leading up to the surface of the ground. They dug up the infernal machine, and were astounded to find that not only did the box contain a small gas generator with a time-clock arrangement rigged up to a valve on it, so that gas would be generated and sent into the cave at a *certain pre-arranged hour*, but that also there was a sufficiently large quantity of high explosive in the container

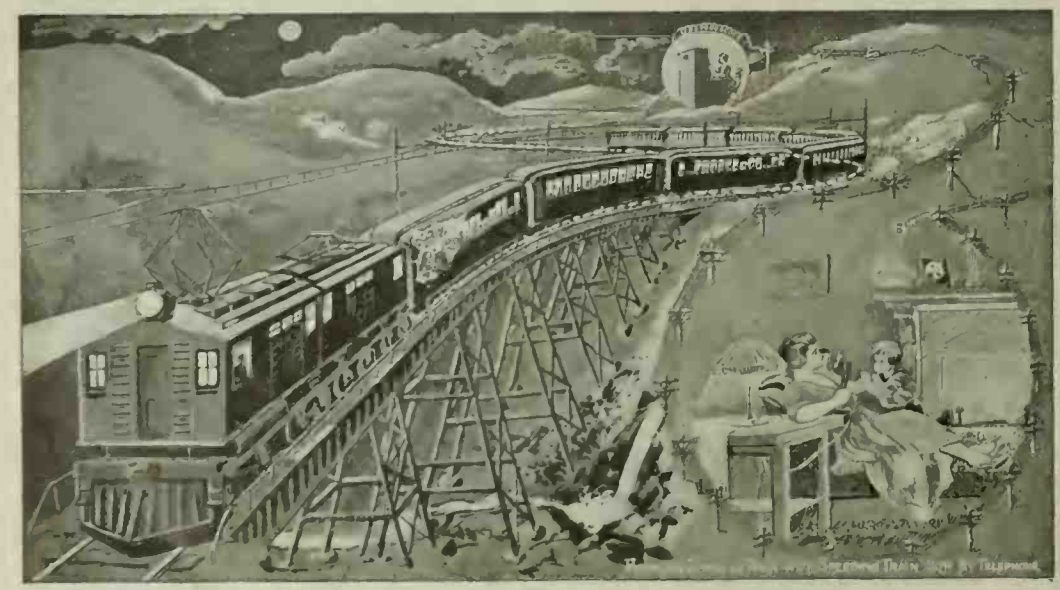
Submarines in Peace-time

Now that the great world cataclysm is practically over, we have to think of many reconstruction problems, and one of these will undoubtedly have to do with many of the marine as well as military apparata and devices which have been developed and built in unbelievable quantities. For one thing, there will be a superfluity of "submarines"—especially surrendered U-boats. A New York inventor, Mr. George Wall, has proposed and here illustrated a novel use for these superfluous submarines, namely, to utilize them as freight carriers, and not only to perform this service in the ordinary sense, as has been done when the giant submarine "Deutschland" crost the Atlantic Ocean with a cargo, but to arrange for these submarines to pass thru a submarine tunnel for example. Let us consider, as Mr. Wall points out, the freight-handling problem at Manhattan Island, New York, where incoming steamers are un-



The Above Illustration Shows Mr. George Wall's Peace-Time Utilization of Germany's Surrendered U-boats, or Any Other Submarine Which May Be Scrapt by Uncle Sam or His Co-Allies as Being Unfit for Further Naval Use, but Which with a Little Overhauling Can Be Readily Put In Condition for Use as Freight Carriers. The Scheme Here Illustrated and Described Would Involve the Use of Electrically Operated Locks at Points on the North and East Rivers, If Used to Carry Freight Under New York City, and Also the Submarine Tunnel Would Be Illuminated with Powerful Electric Lights Placed In Sunken Reflectors, So as to Leave the Passage of the Tunnel Smooth and Even.

Telephoning To and From Moving Trains

THREE Americans residing in Toronto, Canada, Messrs. Isidor, Abraham and Samuel Berliner, have invented a moving train telephone apparatus for telephoning to and from trains en route, as depicted in the illustration. This apparatus permits voice transmission to be made automatically and directly thru the ordinary car wheel and axle, without the assistance of any contributing medium, by a special instrument connected to the wheel. Thus electrical connection between the instrument and the rail is made thru the car wheels, and in combination with the ordinary rails properly bonded for the block-signal system, but it will work equally well on any track where the rails are similarly bonded, without regard to the absence or presence of a block-signal installation.

Telephonic speech or voice transmission is conducted thru the ordinary existing axle, thru the wheels and down to the rails, along which it runs and is picked up by other moving trains or any of its desired joined cars, train despatcher's offices, signal towers, stations, city exchanges, cities, towns, villages, hamlets, or with that of any regular telephone subscriber. This railroad telephone invention consists of an apparatus including standard equipment only comprising the well-known telephonic retardation or repeating coils, ordinary rolling stock of wheels and axle, requisite bearing instrument from which it is connected to the wheels, and the usual rails, properly bonded. This transmission and reception is carried on, it is claimed, without regard to the trains' speeds or of trains moving in the same direction, opposite directions, trains crossing over at right angles to another, or any other moving positions, whether this be upon the same track as in the case of a double-track line, or between any tracks.

The control of the system differs in no respect from ordinary telephone operation, and artificial amplifiers requiring delicate adjustment are not employed. The invention now makes it possible for connection to be made between the train instrument and that of any regular telephone subscriber. Train speed is of no material consequence, for the same results are attained traveling 60 miles an hour as when barely moving.

Telephoning Between a Moving Train, Irrespective of Its Speed, and Any Fixt Station, Office, or Home, Is Now Possible—Thanks to a Recent Invention, Which Enables the Telephonic Currents to Travel Thru the Car Wheels and Along the Rails to the Nearest Telephone Exchange.

Submarines in Peace-time

loaded in some cases on the piers at the North River. This freight is frequently trans-shipt by auto-truck or otherwise to points directly across the city. In other words, the goods are often carried thru thickly congested streets over to the East River or in that vicinity. If we had a submarine channel bored thru the solid rock many feet below all of the present subways, it would provide a feasible and economical method of trans-shipping freight from the North to the East River and vice versa. As it is, goods are often shipt by auto-truck or across the city at considerable expense, or else by boat down the East River, around the Battery and up the North River. This is bound to be so, in some cases, owing to the fact that vessels frequently carry mixt shipments of goods. This scheme is undoubtedly feasible and economically applicable to many shipping localities in various other parts of the world.

Copyright, 1918, by E. P. Co.

Thus "Subs" Could Be Economically and Efficiently Used, Which Would Be Applicable in Many Shipping Localities Thruout the World. Where a Great Deal of Shipping Would Have to Be Handled, There Would Be Employed Two Tunnels and Two Sets of Locks, the "Subs" Loading at Either Side of Large Piers to Which the Steamships Anchor. Very Little Handling of the Freight Would Be Necessary—Thanks to the Modern Electric Belt Conveyor and Other Systems. The Submarines Could Be Handled by a Small Crew and the Steering Bearings Taken by Observation Thru Large Glass Windows in the Superstructure of the Submarine.

This system also permits telephoning to be done from one end of a train to the other or to any part of the train. The conversation may be held as easily as from house to house. The tone of the voice is just as clear as with the telephone on a city circuit. One cannot tell that the train is moving, as far as the sound in the instrument is concerned, it is claimed.

A working model of a new moving train telephone apparatus has been very successfully demonstrated by the Canadian Government Railways on their road by Mr. W. W. MacFarlane of New York, who conducted the tests of his new invention, which was tested at Moncton, N. B., Canada, from July 16, 1917, to March 28, 1918, inclusive.

During these tests, which were very complete, the conversations were carried on between the moving train and the dispatcher's office in a clear and distinct manner.

The engine was cut off from the car and proceeded a mile down the track by orders telephoned from the conductor to the engineer. The engine was then stopt by telephone orders from the conductor, who was on the car, and instructed to come back and couple up again. Then an order was given by the conductor to back up the train and take on the flagman, who had gone back to flag.

Before backing up, a telephone message was sent to the dispatcher's office, asking if it was safe to back up, and the answer by telephone from the dispatcher was that this would be all right. After backing up to the flagman, the order was received from the dispatcher's office to go ahead to Humphrey's and cross over to the other track and come back to Moncton. Before reaching Humphrey's a second telephone message was received from the dispatcher countermanding the previous order to cross over, but to return to Moncton on the same track, as the train was protected from the rear.

All these instructions were transmitted by telephone from the dispatcher's office to the conductor on the car and by him transmitted to the engineer by telephone, while the car was running, showing that it is perfectly feasible to control a moving train by telephone from the dispatcher's office at a distant point. The invention is patented in the United States and Canada as well as in foreign countries. This new railroad telephone system promises to completely revolutionize modern railroading.

INDIAN PRINCESS LEARNS WIRELESS.

The accompanying photograph shows an Indian princess learning wireless telegraphy —Miss Emily Moran, descendant of a famous Indian chief. She promptly offered her services to her country in this national crisis, and is rapidly learning the art of radio operating so that she can graduate from clerical work to the wireless room of an ocean liner or possibly a transport.

Many young women have taken up wireless operating, several of the leading schools having classes at which young ladies attend. At the present time there has not been a very large opportunity to place these fair radio graduates, for the reason that the Navy Department controls all the wireless stations, and it is against their rules to have women in any government radio stations. However, there are many ways in which women trained as radio operators can help and have been helping. For one thing, they can be of considerable aid in helping to teach the soldier and sailor "rookies" the rudiments of radio operating—particularly the code, which is always a great stumbling block to most of them. Women should prove particularly efficient in teaching this part of the radio art, for they have proven themselves very adept and successful in imparting knowledge to students of all ages in our public schools thruout the country.

A New Aërial Smoke Barrage

THE airplane has surely come into its own during the recent world war. Hundreds of 'planes were to be seen in the air on various sections of the great battle-front many times during the day, their glistening wings sparkling in the bright sunshine. Pursuer and pursued hurtled thru the air at prodigious speeds. These airplane attacks looked all very tame from the ground until one of them closed in on his adversary, when many a spectacular battle was enacted. Perhaps one of the most spectacular of all aërial battles is that mentioned in a number of the interesting stories that have come to us from the lion-hearted fighters of the air, where an enemy 'plane has dropt out of a cloud, in order to pounce down and surprise an unsuspecting flier below. Some of the German aviators used to practise this trick regularly, sailing upward thousands of feet, only to suddenly disappear in a cloud or cloud bank. Then the crafty flier would suddenly dart out of a cloud at the side or at the bottom, and if a hostile 'plane happened to be anywhere in the vicinity, the factor of surprise would in practically all cases be on the side of the emerging war-'plane.

But clouds would not always be conveniently at hand for carrying on such maneuvers. There is not now, nor is there likely to be an international law on the conduct of aërial warfare to the effect that battle 'planes may not play hide and seek among the clouds if they choose to. Wherefore and hence, we have the latest invention in aërial warfare—the *"airplane smoke producer"*—the particular form of this invention here illustrated and described being due to John Koltko, of Watertown, Connecticut.

As the front cover and accompanying views show, this invention enables an aviator to quickly send out a large quantity of heavy smoke which will entirely envelop the 'plane and prevent, or at least make it extremely difficult for, an enemy 'plane to "plant" a good shot on him. This is more apparent when it is considered that the 'plane would not simply have a dense cloud of smoke blown around it at one point in the air, but it would in a few minutes produce a long trailing cloud of black smoke, and it would indeed be quite difficult for an aviator to tell at exactly what point in this cloud the enemy 'plane was.

The technical details of this smoke-producing apparatus for aircraft are quite simple and it operates as follows: A steel tank is mounted in the body of the 'plane with which there is connected a by-pass pipe connecting with the exhaust of the engine. A suitable valve controlled from the pilot's seat is connected with this pipe, so that when it is desired to produce a smoke cloud to envelop the 'plane, it is only necessary to open the valve and allow the engine exhaust to pass into the tank. The tank contains certain chemicals which when acted upon by the gases from the motor exhaust, produce smoke rapidly in great volume.

As the illustration shows, the diffusing heads consisting of conically-shaped drums with perforated faces on them, are placedaround various parts of the airplane, under the wings and along the fuselage.

Copyright, 1918, by E. P. Co.

Not Only Can the Naval Destroyers and Other Vessels Throw a Dense Smoke Screen, but the Battle-plane as Well. This Recently Perfected Invention Causes the Exhaust Gases from the Engine to Pass Into a Tank Containing Certain Chemicals, Which, When Thus Acted Upon, Produce a Dense Smoke In Great Quantities. The Smoke Is Distributed Thru Diffuser Heads About the Planes.

THE MAGNETIC SURVEY VESSEL, "CARNEGIE."

The Magnetic Survey Vessel, *Carnegie*, arrived safely at her home port, Washington, D. C., a short time ago, where she was put out of commission during the period of the war. During her cruise from Buenos Aires, Argentina, round the Horn to Valparaiso, Chile, Callao, Peru, thence thru the Panama Canal to Newport News, she was in command of Dr. N. W. Edmonds and a number of other scientists of the Government staff.

"The Long Dash"—A Wireless Gun Show

BACKED by an absorbing story enacted and assisted by elaborate scenic and stage effects, "The Long Dash" has proven one of New York's latest and greatest theatrical successes. The play was written by Robert Mears MacKay and Victor Mapes, co-author of "The Boomerang." It has a distinguished cast, including Robert Edeson, Henry E. Dixey, Violet Kemble Cooper, Milicent Evans, and others. The dramatic story revolves around the invention of a marvelous new "radio controlled" cannon. The secret of its operation is stolen by a spy. With the inventor of the gun dead and the radio code by which the gun is operated lost, many curious and exciting incidents result. Interspersed with all these affairs there is a delightful love story in which two brothers, Paul and John Hazelton, both impersonated by Robert Edeson, are concerned.

Now for the dirty work. Those who have seen this show have undoubtedly wondered just how the wireless controlled gun, a large sized and faithfully reproduced model of which is used on the stage, as the accompanying photographs show, is operated. For it surely does give one, no matter how sophisticated in scientific matters he may be, a genuine dramatic thrill. Robert Edeson, who endeavors to solve the mystery of the lost code, presses the key of the wireless transmitter located across the stage from the gun, and every time he presses the key a crashing blue-white spark several inches long leaps across the spark gap at the transmitting apparatus. A similar spark also appears simultaneously at the spark gap fitted on the gun pedestal. Being of a scientific turn of mind, he eventually gets down to the point where he can cause the gun to train around a circle, and also up and down vertically, besides firing. The controlling signals comprise a number of dots or short sparks, and after the proper number of these have been transmitted, a long dash or spark is required to cause the particular function in hand to take place. Thus when the gun is to be fired, after being trained with a previous set of signals or sparks, a number of short flashes are rapidly transmitted, and then the "long dash" or spark is the signal that the gun will fire. A thirty-eight caliber Colt revolver is cleverly arranged inside of the model cannon and this, operated by a stage assistant, produces the explosion whenever the gun is fired.

But this is not all, for to lend still more enchantment to the seeming mystery of this pseudo-scientific drama, the target at the rear of the stage plays a very important rôle, for every time the gun operates another "bullet" goes thru the target. At least the audience thinks so, for does not a hole appear in the target each time the gun fires? Sure it does, and little Willie in the front row as well as his grand-dad probably wonders how in the dickens they can fire a small naval cannon right on the stage and cause a shell to pass thru the target without killing a few dozen actors standing off stage. The truth is, there "ain't no such animal" as a bullet used, but a trusty assistant stands ready with a string in his hand, and each time the gun fires he yanks another wad of paper out of a previously prepared hole in the bull's-eye of the target. "Ye gods!" little Willie remarks, Mr. Edeson is sure some sharp-shooter, and in truth he is, so far as the story of the drama is concerned.

The Wireless Controlled Cannon Speaks—and Hits the Bull's-Eye Every Time. An Exciting Moment from the New York Dramatic Success, "The Long Dash." Mr. Robert Edeson Plays the Rôle of the Radio Genius, Who Works Out the Code Which Will Operate the Gun, Its Inventor Having Died.

As will be recollected, in the introduction it was mentioned that Mr. Edeson impersonates two rôles—that of Paul Hazelton as well as John Hazelton. In another act a clever bit of stage work is carried out, and a few words describing it will undoubtedly prove of interest. In this scene one of the brothers sits down in a large high-back, old-fashioned chair, and presently turns the chair with its back to the audience and starts eating at a table. The audience sees the actor's arms moving as he proceeds to eat his dinner, but the old saying that the "hand is quicker than the eye" still holds good to a dot, for right before your very eyes and while the good Mr. Hazelton No. 1 apparently is enjoying his meal an unseen transposition takes place in a few seconds. The seat of the chair is a spring-actuated affair and collapses when desired. The actor escapes down thru the bottom of the chair by means of an electrically operated dumb-waiter, or "trap," as it is called in stage parlance, and another actor rises on the trap, gets into the chair and carries on the arm movements and other embellishments that go with the assimilation of a hearty repast; and in the meantime the door of the room opens, and in walks the other brother, Mr. Hazelton No. 2, who is no other than our old friend, Mr. Robert Edeson.

A Close-Up View of the Wireless Gun and Radio Transmitter, with Mr. Edeson Studying Its Response to Various Dot and Dash Combinations, from the Play—"The Long Dash."

An electrically controlled machine for sorting coffee beans has been invented by a native of Munich.

India has increased its annual coal production to 12,000,000 tons and is introducing electrical machinery into some mines.

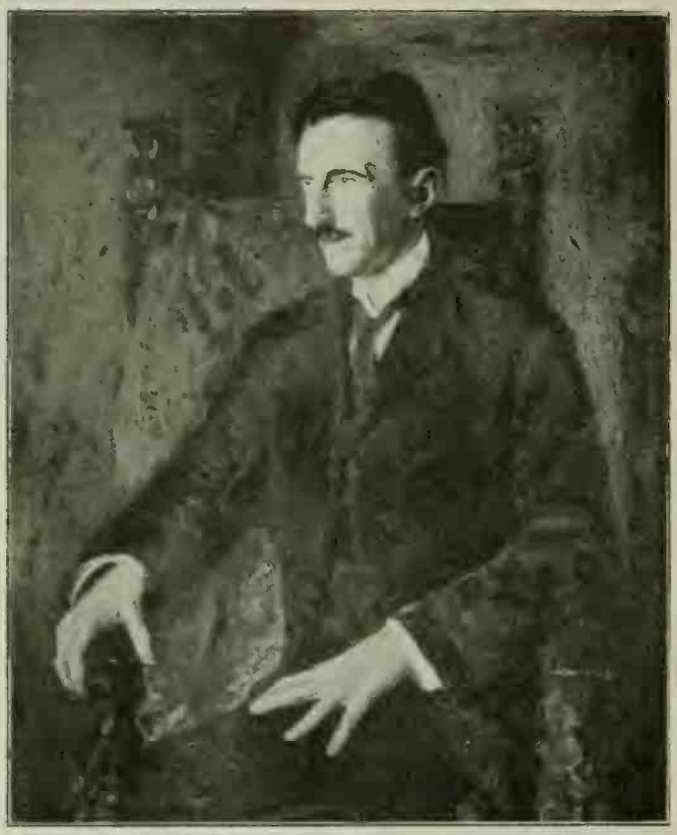
Nikola Tesla and His Inventions

By H. Gernsback



AN ANNOUNCEMENT

SEVERAL years ago, in the course of a discussion, a well-known journalist asked me whom I considered at present the world's greatest inventor. I said: "If you mean the man who really *invented*, in other words, *originated* and *discovered* — not merely *improved* what had already been invented by others, then without a shade of doubt, Nikola Tesla is the world's greatest inventor, not only at present, but in all history."

My friend was much surprised and voiced his astonishment. "Surely," said he, "you do not mean to place Tesla ahead of such great men as Archimedes, Faraday or Edison?"

"That is exactly what I mean," I replied, "and before twenty-five years have elapsed the world at large will echo my opinion."

"But listen," persisted my friend, "who on earth is this man Tesla anyway? What are his wonderful inventions, what great thing has he ever done? How is it that the world at large does not know him?"

Nikola Tesla, from a Painting by the Famous Princess Lwoff-Parlaghy. This Picture Has Never Been Published Before.

"To begin with, and the better to impress you," I replied, "Tesla has secured more than one hundred patents on inventions, many of which have proved revolutionary. Science accords to him over 75 original *discoveries*, not mere mechanical improvements. Tesla is an originator in the sense that Faraday was an originator. Like the latter he is a pioneer blazing the trail; aside from this he is a discoverer of the very highest order."

"Ninety percent of the entire electrical industry pays tribute to his genius. All electrical machinery using or generating alternating current is due to Tesla. High tension current transmission without which our long distance trolley cars, our electrified lines, our subways would be impossible, are due to the genius of Tesla. The Tesla Induction Motor, the Tesla Rotary Converter, the Tesla Phase System of Power Transmission, the Tesla Steam and Gas Turbine and the Tesla Coil and Oscillation Transformer are perhaps his better known inventions.

"As to your last question, namely, why the world at large does not know Tesla, it is answered best by stating that he has committed the unpardonable crime of not having a permanent press agent to shout his greatness from the housetops. Then, too, most of Tesla's inventions, at least to the public mind, are more or less intangible on account of the fact that they are very technical and, therefore, do not catch the popular imagination, as, for instance, wireless, the X-ray, the airplane, or the telephone."

The trouble with Nikola Tesla is that he lives a century ahead of his time. He has often been denounced as a dreamer even by well informed men. He has been called crazy by others who ought to know better. For Tesla talks in a language that most of us do not as yet understand. But as the years roll on Science more and more appreciates his greatness, and begins to pay him tribute more and more.

In 1893, three years prior to the earliest attempts in Hertz wave telegraphy, Tesla first described his wireless system and took out patents on a number of novel devices which were then but imperfectly understood. Even the electrical world at large laughed at these patents. But large wireless interests had to pay him tribute in the form of real money, because his "fool" patents were recognized to be fundamental. He actually antedated every important wireless invention.

A few weeks ago the world read thru news dispatches of a great wireless discovery—the static eliminator. But Tesla had not only patented systems overcoming this and other forms of interference but had actually constructed and successfully operated devices years ago in Colorado, under conditions where static interference was troublesome to an extraordinary degree. A photograph of one form of his apparatus is published with a note from him for the first time elsewhere in this issue of the ELECTRICAL EXPERIMENTER. And so it goes. The world smiles an unbelieving smile, but Tesla's master mind invariably sets the world aright.

I first read about Tesla in a well-known German weekly publication when I was less than 15 years old. The Editor of that publication reproduced his picture on a full page and paid high tribute to Tesla, hailing him as the world's coming greatest electrician.

H. W. Buck, Chief Engineer, President of the American Institute of Electrical Engineers, among others, said: "The work of Nikola Tesla in his great conception of his rotary field seems to me one of the greatest feats of imagination which has ever been attained by human mind."

Lord Kelvin, before the British Association, commenting upon the Tesla Transformer exhibited, said: "This is a wonderful development of the induction coil destined to be of great importance."

Electrical Review, commenting upon the wireless: "Mr. Tesla's

www.americanradiohistory.com

researches in this field have attracted world-wide attention, and his is undoubtedly the master mind."

Der Electro-Technische Anzeiger, Berlin, and *Elektrizität*, Leipzig, Germany, (commenting upon Tesla's work): "It is a combination of the grandest power of technical performance with the most vivid imagination, such as has never before manifested itself in the human mind."

Brigadier Allen, of the United States War Department (commenting upon Tesla's Turbine): "Something new in the world. Officers are greatly impressed with it."

While studying abroad I read every scrap of his work I could lay my hands on. I performed most of his high frequency experiments, and the more I saw of his work the more imprest I became. Some years ago as Editor of *Modern Electrics*, I met him in a New York shop where his famous turbine models were first built. I was fascinated with the tall, gaunt man, then about 50 years old, but looking less than 30. His extraordinary face, with his deep set blue eyes, proclaimed the intense thinker—the philosopher. A few minutes' chat with him left me more than ever convinced of his greatness.

Further contacts during the past few years still enhanced my opinion of him. Tesla is a man of extraordinary knowledge. He is remarkably well read and has a photographic memory whereby it is possible for him to recite page after page of nearly every classical work, be it Goethe, Voltaire or Shakespeare. He speaks and writes twelve languages. He is an accomplished calculator, who has little use for tables and text-books and holds the sliding rule in contempt. Tesla has received numerous honors and distinctions of all kinds. He is a knight of several orders, holder of many titles and diplomas. Some time ago he was awarded the Elliott Cresson gold medal by the Franklin Institute and last year the Edison medal by the American Institute of Electrical Engineers. Many extraordinary distinctions have been offered to him which he has declined. As of timely interest one instance may be mentioned. At the announcement of Tesla's high frequency discoveries, while the former Emperor of Germany was all-powerful and great men were eager for his favors, Tesla received an invitation from him and the Empress to repeat his celebrated experiments at the Royal Palace in Berlin. He forgot all about it and did not answer for one year, when he politely apologized for his inability to avail himself of the honor. Later the invitation was renewed and nearly two years past before Tesla answered to the same effect. After a lapse of time, however, upon the announcement of another important invention, he received the invitation for the third time, with the assurance that an altogether unusual honor was reserved for him. "Well, boys," said Tesla to his assistants after he laid the invitation which he never answered aside, "the Emperor must be a great man. I do not think that I would be capable of acting in this way if I were in his place." Perhaps the most remarkable tribute was paid to him when he made his famous experiments in Colorado in 1899. It was by J. Pierpont Morgan, the elder, who donated $150,000, which enabled Tesla to produce artificial lightning and incidentally to electrify the entire earth.

Some of Tesla's inventions have been of far-reaching importance in the War. The resources and productive powers of the country have been greatly increased thru extended use of his system of alternating current transmission and transformation of energy. Nearly ten million horsepower of water falls have been harnest by this means, thus saving forty percent of the entire coal output of the United States. The railroads have been electrified and his induction motor has revolutionized the steel industry and operation of factories. His electric drive has been adopted on the largest cruisers and battleships as the most perfect means of propulsion. His wireless inventions have proved indispensable and his oscillatory apparatus has been of inestimable service in chirurgical and therapeutic treatment in the field.

The technical prints abound with his work, his inventions, his discoveries. The following is only a partial list of terms now adopted and published in text books and technical works:

Tesla two-phase, three-phase, multi-phase, poly-phase system of power transmission
Tesla principle
Tesla rotating magnetic field
Tesla rotating magnetic field transformer
Tesla induction motor
Tesla split-phase motor
Tesla system of distribution
Tesla rotary transformer
Tesla system of transformation by condenser discharges
Tesla coil
Tesla oscillation transformer
Tesla electrical oscillator
Tesla mechanical oscillator
Tesla high frequency machines
Tesla dynamo-electric oscillator
Tesla tube
Tesla lamp
Tesla high-potential methods
Tesla inductor
Tesla marvels
Tesla impedence phenomena
Tesla electro-therapy
Tesla electrical massage
Tesla currents
Tesla transmission
Teslaic experiments
Tesla capacity
Tesla arclight system
Tesla third brush regulation
Tesla devices
Tesla sparks
Tesla arrangements
Tesla theory
Tesla point
Tesla Steam Turbine
Tesla Gas Turbine
Tesla Water Turbine

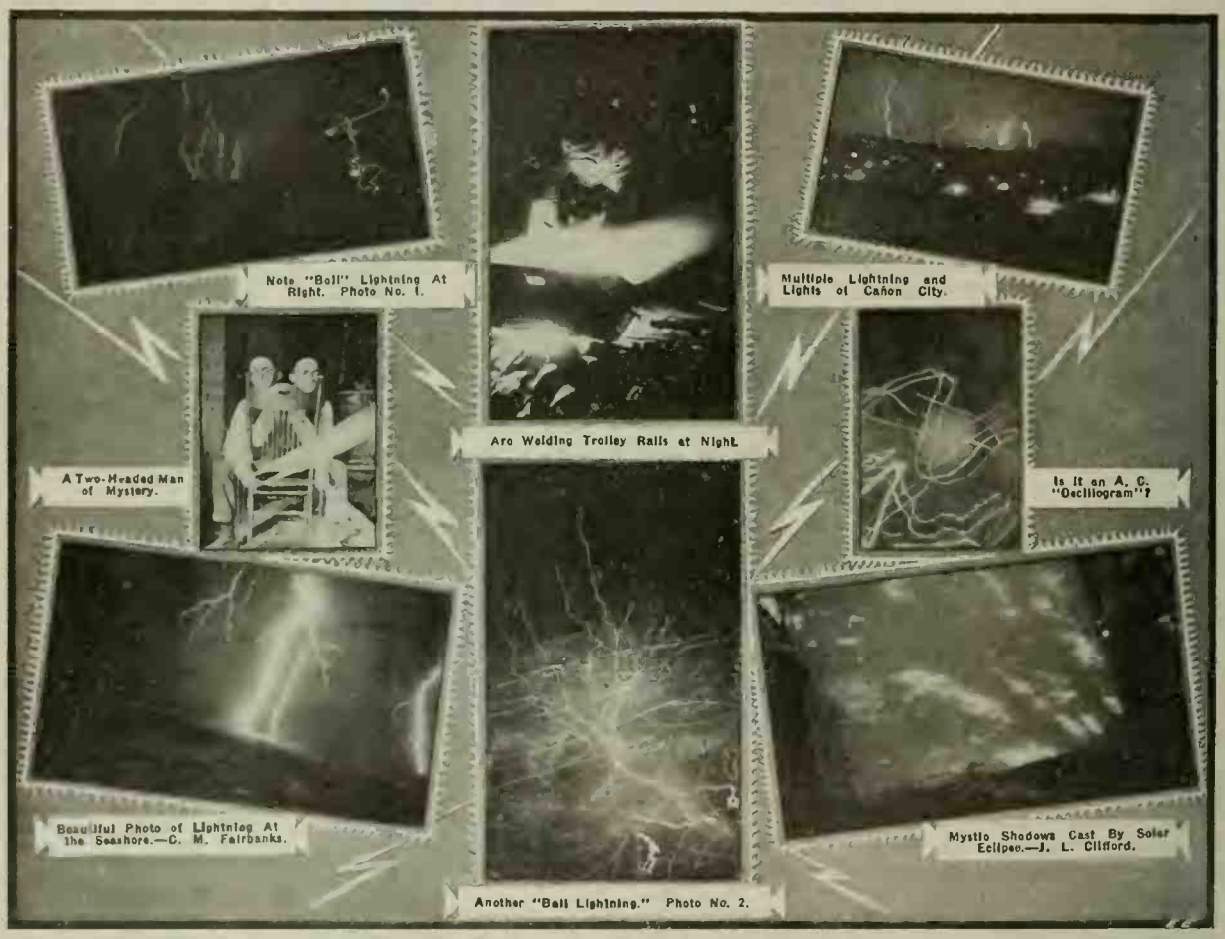
Tesla Compressor
Tesla Igniter
Tesla condensers
Tesla electro-static field
Tesla effects
Tesla wireless system
Tesla methods of wireless transmission
Tesla magnifying transmitter
Tesla telautomata
Tesla insulation
Tesla underground transmission, etc.

The other night the Editors of the "Experimenter had the opportunity of passing an evening with Tesla. We talked about many things, so interesting, that I will reserve them for another article—but mostly, of course, the conversation centered about Tesla himself.

"Dr. Tesla," I said to him, "you are aware of our great admiration for you, which may or may not be important. But the great public knows little of your mark. Even many of those technically educated—excuse the frankness—think that you are

(*Continued on page* 657)



BY special arrangement the ELECTRICAL EXPERIMENTER will, beginning with the next issue, publish a series of articles entitled "My Inventions", by Nikola Tesla. The great inventor will contribute a signed article monthly, which articles will run for several years. Most of this material has never appeared in print before. The articles will be publisht in book form later. We consider this announcement the most important we ever made. THE PUBLISHERS.

NIKOLA TESLA, in the opinion of authorities, today is conceded to be the greatest inventor of all times. Tesla has more original inventions to his credit than any other man in history. He is considered greater than Archimedes, Faraday, or Edison. His basic, as well as revolutionary, discoveries for sheer audacity have no equal in the annals of the world. His master mind is easily one of the seven wonders of the intellectual world.
H. GERNSBACK.

"Odd Photo" Contest

WELL, Readers, what do you think of this perfect galaxy of "Odd Photos"? Fit for a king, eh. That's what we thought and so decided to publish them. Have you ever tried to enter a photo in our "Odd Photo" contest? Now is the time. Just look over this collection, gathered from all parts of the country, and you will gain a clear idea of just what we are after in this direction. We want brainy pictures as well as freak photos. Electrical, Radio and Scientific subjects give you a wide field to choose from. See announcement of "Odd Photo" contest elsewhere in this issue.

WELDING CAR TRACKS AT NIGHT

Herewith is an interesting night picture of men welding car tracks in Buffalo. The welding, of course, is electric, the trolley wire being tapt and a wire fastened to a weight placed on the track, making the connections. The 550 volt current is reduced thru a bank of resistance grids carried on a cart. The men are equipt with a heavy glass mask of special design, to protect their eyes and ears.

Kenneth Strickfaden, New York City.

IS IT AN A. C. OSCILLOGRAM?

I here present a print which resembles an alternating current oscillogram. This, I am told, was caused by the film being wound too fast, thereby causing static electricity.

What caused the lines to be in double, or in pairs? Can anyone explain this?

What causes the lines to have those peculiar peaks?

I hope that your readers can answer it.

Wm. P. Ullrich, Ansonia, Conn.

LIGHTNING AT THE SEASHORE

Here is an excellent photograph of an electrical storm at the seashore.

Last August, while at the seashore, I was awakened about 1 A. M. by the loud crashes of a storm. The flashes were very bright, so I got out my camera. Herewith is the best picture I obtained. In the foreground is a boys' camp and the board walk. The beach can be made out very clearly.

C. M. Fairbanks, Ocean City, N. J.

MYSTIC SHADOWS CAST BY SOLAR ECLIPSE

One of the many interesting phenomena occasioned by a partial eclipse of the sun is the shape of the shadows cast by the light filtering thru the trees. The present picture is one taken during the eclipse of June the eighth, at a spot where the eclipse was 85 per cent. The picture is of a sheet held in the shadows cast by a tree, when the sun was a crescent. It will be noticed that the shadows are all shaped like a crescent—in fact, an exact image of the sun at that time. The explanation of this is that the small apertures in the foliage acted like small lenses and projected the image of the sun on to the ground, or in this case the sheet. During the eclipse the ground and the sides of houses were covered all over with these minute crescents, and it was very interesting to watch them and to note how they corresponded with the changing images of the sun on this particular occasion.

James L. Clifford,
Evansville, Ind.

A 2-HEADED MAN

The photo herewith, altho it does not bear any relation to electricity or radio, you will admit is odd. It is prized especially because of its history. The photo itself is a double duplicate of my homely physiognomy and was taken under several difficulties. In the first place I was home with the mumps and the measles and, being at a loss for something to do, I started to pester my peaceful camera. Secondly, I was alone and had to take the picture myself. Thirdly, my camera is a box type, and I had to rig up a series of wire rings, so

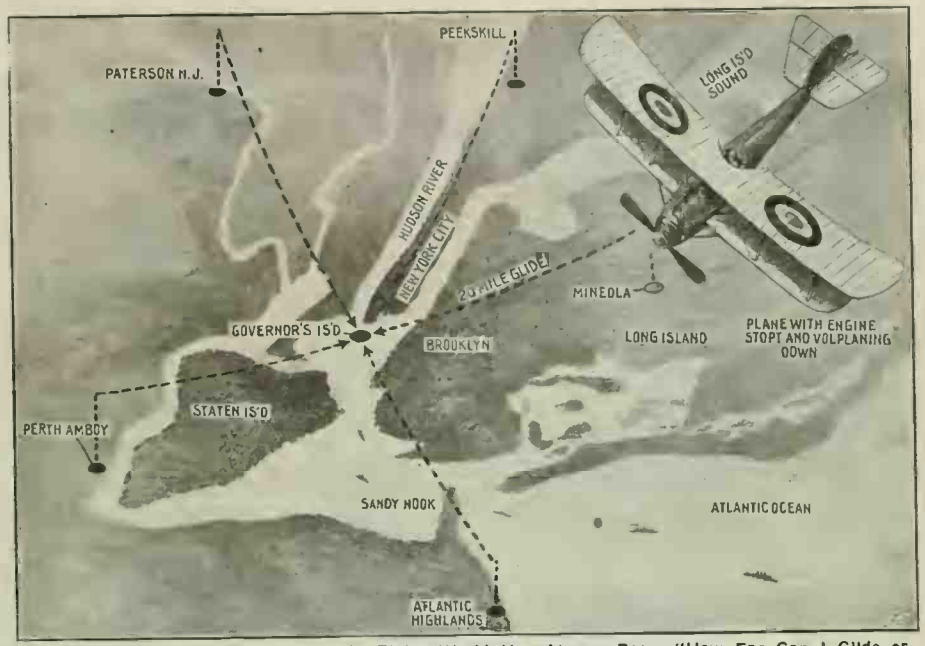
ELECTRICAL DENTAL AUTO FOR UPTON SOLDIERS.

There's nothing like having a "pull"—especially if you happen to be one of Camp Upton's sons. Just think of the pleasure of sitting down in this elaborately equipt dental palace—why we'll bet the D. D. S. hates to leave it at night. Believe the "Doc." when he says—"We send them away with a smile!"

In examining Upton's portable dental car we note that electricity is used to almost the same extent in this portable office as it is used in the private practise of the modern dentist. Altho Camp Upton has an elaborate dental equipment, with twenty-two chairs at the Dental Infirmary, five more for the Depot Brigade, and three at the Base Hospital, and a staff of Assistant Dental Surgeons, there is still need for the dental ambulance, for among the thousands of soldiers who pass thru the cantonment, there are many who for various reasons cannot come to any one of the three permanent offices. With its complete equipment, no case is too severe to be treated, a fact which is admirably borne out by the records of the office. As many as a hundred patients have been treated in a day, the work including everything from preliminary examination to the relief of aching molars or the filling of cavities.

The dental chair, which we here see so well "filled" with a 180 pound Upton patient, with its fountain cuspidor is exactly similar to the chairs found in any well-appointed office. Conveniently located on one side is the familiar bracket table for instruments, while in front of the chair are the electric motor and extension arm of the all important and nerve twiddling drill. The foot control is on the floor behind the chair. Overhead are two incandescent lamps in special reflectors, which assure adequate and well-directed illumination. Even a motor-driven lathe is on hand.

The electric equipment operates at six volts, current being provided by a three-cell storage battery. This battery provides sufficient energy to operate the entire electric equipment for a two weeks' period. It is the only source of electric energy in the outfit, for the auto-engine is not fitted with a dynamo. A rectifier enables the battery to be charged from any lamp socket, however. Also this permits current to be taken direct from the lighting mains when the battery is low.—*Photo courtesy New York Edison Co.*



The Camp Upton Boys All Had a Real Pull with the Dental "Docs," for Electricity Provided Every Convenience Necessary for Pulling and Filling Aching Molars "Painlessly."

New British 'Plane Can Coast 20 Miles to Safety

In a recent report from an aviation camp behind the British lines in France comes the news that while the absolutely foolproof airplane has possibly not yet been invented, in the opinion of American pilots who are working in a British airdrome the newest British machines have very nearly solved the problem.

Left to themselves these latest machines will make their way safely to earth, except for slight damages which may follow a landing. They are so balanced and the wings so arranged that when the engine stops they glide gradually and easily to earth, without the pilot's attention.

The One Great Problem Confronting the Flying World Has Always Been—"How Far Can I Glide or Coast, If My Engine Should Stop?" The Answer Is—Twenty Miles; that is, If You Have One of These Newest British 'Planes, One of Which Has Glided That Distance in an Actual Test.

The following test shows how remarkably stable these airplanes are: A pilot climbed to a sufficient height, stopt his engine and took his hands off the controls, merely keeping his feet on the rudder bar.

He steered for an airdrome twenty miles away and, except for keeping it straight, he let the airplane do what it liked. It traveled the whole twenty miles as steadily as a bicycle coasting down a long, straight and gentle hill.

The accompanying illustration shows just what such a performance means to the aviator, who has heretofore always been in danger of being forced to volplane down at a sharp angle as soon as the engine stopt. Thus the aviator had to make a landing while coming down at a fairly sharp angle, and in some cases the plane has practically "dropt out of the sky," killing the aviator and demolishing the machine.

Just think what it will mean to the birdmen when they can volplane down a distance of twenty miles, such as from Mineola, L. I., to Governor's Island, or vice versa. It's really a wonder our flying machine inventors have not perfected such a device before this, when we stop to think of the many military aviators who have had their engines stall when over the German lines, which invariably meant they had to descend in enemy territory, with subsequent capture.. The cities and towns shown about New York City in the accompanying view are all situated approximately 20 miles distant.

Electrical apparatus taking current from a light socket has been invented by a French scientist to purify the air in a room by literally pumping it into a reservoir and washing it.

New Flashlight Cuts Off After One Minute

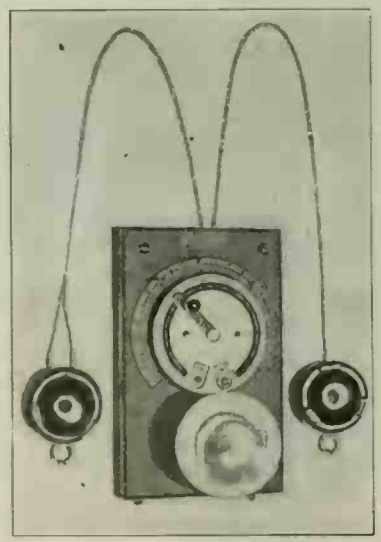
The newly invented and extremely novel electrical flashlight here illustrated incorporates a feature not possest by any other flashlight so far developed, in that when the push button is deprest the lamp circuit is kept closed for a predetermined and specific length of time, such as one minute, and it then opens the circuit automatically. This feature results in a great saving of battery energy, particularly in such forms of the dry battery electric lamp as those made in the form of an ordinary lantern, which are provided with a switch instead of a push button, and which the owners thereof have a great habit of thinking that because it is an electric lantern, it will stand almost any abuse. It would make the heart of any good electrician flutter with extreme anxiety to watch some users of these electric lanterns and see them close the switch and then forget it—a dry battery to them is a veritable electric dynamo; they never give a thought to the fact that the dry cells used in every one of these flashlights, will give several times the life if they would but open the switch or button periodically—say at intervals of one-quarter to one-half minute—in order to give the battery a chance to recuperate.

You Push the Button of This Flashlight—a Minute Later the Lamp Extinguishes Itself Automatically. Result—a Saving in Battery Power and Life.

It is to guard against just such misuses of the electric flashlight that the inventor of the present automatic cut-off push button, Mr. G. H. Parsons of Stamford, Conn., has evolved and patented the device here illustrated. One illustration shows the exterior of his new flashlight, called the "Tempolight," while the second illustration shows a diagramatic view of the interior arrangements. These are simple and comprise the usual lamp bulb, a dry cell, and a circuit-closer or push button, to which he attaches a small air bellows. When the button is deprest this bellows is also deprest, and the air exhausted within it. By means of a slow acting air valve or other suitable arrangement, the bellows, after an appreciable length of time of one-half to one minute, depending upon the period for which it is set to operate, expands and opens the push button contact trigger. A spiral spring on the push button rod tends always to push it outward.

Here Is the Secret of the Automatic Cut-off Mechanism of the Flashlight that Opens Its Lamp Circuit After Burning for a Minute. A Small Air Bellows Does the Trick.

FOOLING THE DRAFT BOARD?—IT CAN'T BE DONE.



THE sad and distressing fact has been brought forth that to escape a righteous duty, one that every full-blooded American should be proud to fulfill, there are amongst us mortals in this free land, a new generation—small in numbers, to be sure—who deliberately seek to evade the greatest of all things—the protection of the Stars and Stripes and the preservation of the Union.

Amongst the false claims is that of *partial* or *total deafness.*

The French military specialists have already experienced considerable difficulty in this direction. It appears that the malingerer most difficult to detect is the one claiming *complete loss of hearing in one ear.* A moment's thought will show why this should be. Were only partial deafness claimed it would not be difficult to trap him, as he could not possibly be consistent in all his statements thruout an extended series of tests; but, with complete unilateral deafness as the claim, he simply and uniformly replies in the negative to all tests applied to the *alleged* defective ear.

Dr. R. R. Brownfield has devised a test which not only definitely determines the acuity of hearing in either ear, but also quickly detects the unilateral malingerer.

In the device as evolved by Dr. Brownfield batteries and make-and-break contacts are entirely dispensed with. The ordinary 110 volt alternating commercial lighting current is used. The variable current is produced by a potentiometer, and is variable from an absolute zero to maximum. No vibrating iron is used, and the maximum strength of current employed is dependent on no factor except the ratio of the electrical resistances employed. The sound producer is similar to a telephone receiver except in one very important respect—the core is of soft iron and is not magnetized. This results in eliminating the variability due to demagnetization and doubles the pitch, so that the ordinary 60 cycle current produces 240 vibrations per second—about equal to the average tone used in conversation.

The "Slacker" Tries to Fool the Draft Board—But Here's the Electric Telephone "Hearing Test" Apparatus that Fools the Would-be Shirker.

The sound producer is provided with three lugs to hold it away from the ear, so that the sound will be transmitted solely by air conduction. By simply turning the indicator from 100 to zero, one can cause the sound to increase from the point at which it is just perceptible to one of normal hearing, the threshold of audition, or 100 per cent. acuity, to a degree of intensity at which failure to perceive it indicates that the subject has no practical hearing. In addition to the variable receiver, there is a *supplementary* one that always operates at *maximum intensity*, irrespective of the loudness of the other.

In the usual test for the acuity of hearing, only the variable receiver is used. As the subject holds this to the ear, the pointer is gradually moved from zero to a point on the scale is reached, that would normally indicate very defective or almost no hearing for the good ear.

The very nature of the test, it will be noted facilitates the detection of fraud, because the better he can hear in the alleged defective ear, the less he will hear in the other—a condition just the opposite of what he might expect, so that when he makes his usual negative reply he is for once telling the truth and trapping himself. Under these conditions the sound appears to come in some mysterious way from a point at the center of the head; and if the two ears are approximately equal in acuity, there is absolutely no possibility of indentifying the gradually increasing sound in the supposedly good ear until a point is reached on the scale away beyond the reading that would be obtained when the loud receiver is disconnected. Hence in the case of the pretender, the physician has only to repeat the test with the loud receiver disconnected, and a totally different reading will be secured, thus proving the deceit.

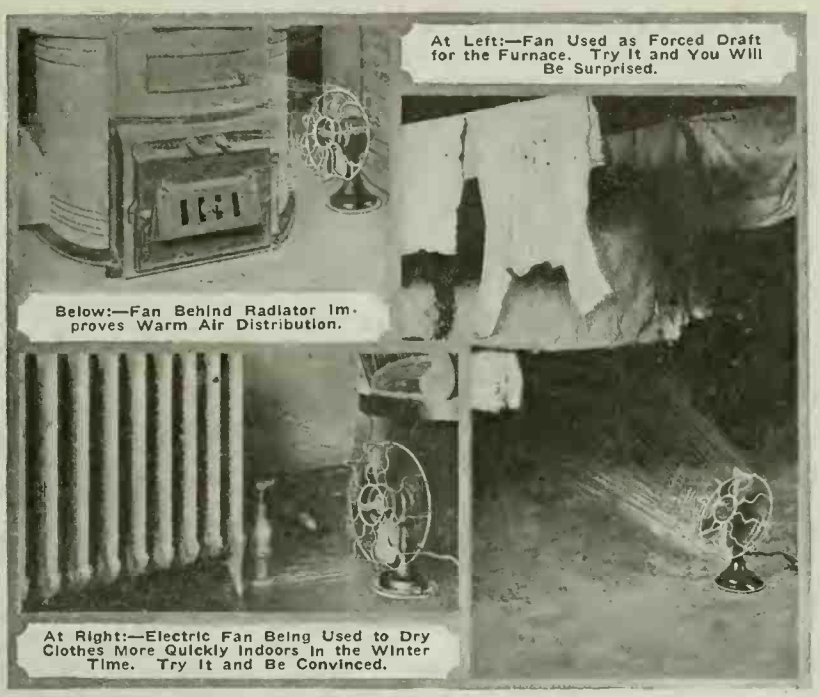
Wintertime Uses for the Electric Fan

By PAULINE GINSBERG

HAS it ever occurred to you that the electric fan can be used to great advantage in the wintertime as a labor and time saver? Probably it has not. This is but natural on account of the popular idea that the fan has only one mission, that of cooling the air. What the fan really does do is to circulate it. By impelling circulation, for instance, about the body, the displacement of the warm air for the cooler, as well as surface evaporation accordingly gives a cooling sensation, but in hot weather such as in July, the forced air from the fan does not change for the cooler, it being equally warm both indoors and out and the fan sometimes causes more discomfort than comfort. As many of us have entertained the idea that the fan cools the air, naturally the fan was invariably hustled to a secluded nook in the attic or down the cellar until the warm zephyrs of the next spring reminded us that it was "fan-time" again.

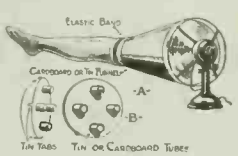


A few suggestions are here given for the wintertime utility of electric fans, and eventually you will find a number of other uses to which the electric fan can be employed with benefit.

Removing Odors from the Kitchen.

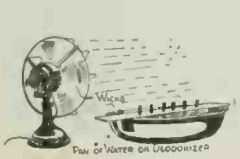
When the master of the house (or was it the janitor?) goes down to the cellar, and after much ado about the furnace (no, not "nothing"), finally makes a heroic attempt at starting a fire on a sultry day and it won't work—what to do for a forced draft? Just apply a fan opposite the front or side ashpit door of the furnace as herewith illustrated, and the fire will soon be crackling away merrily. Along this same line of the heating problem it can often be placed behind or in front of the steam radiator to circulate the air around and thru it so that the room is heated more rapidly and evenly.

Something that many women will appreciate is the use of the fan in the laundry for drying clothes. You will notice, in the third photograph, how the fan is placed away from the clothes lines in order to give a freer circulation of air so that it passes over all the clothes, and has therefore almost the effect of a light wind were the clothes outdoors. If the windows are kept open both at the top and bottom, you will be surprised how nicely they will dry.



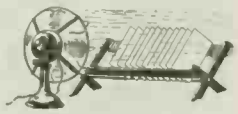
At Left:—Fan Used as Forced Draft for the Furnace. Try It and You Will Be Surprised.

Below:—Fan Behind Radiator Improves Warm Air Distribution.



At Right:—Electric Fan Being Used to Dry Clothes More Quickly Indoors In the Winter Time. Try It and Be Convinced.

The fan in the kitchen window solves a problem that confronts every housewife—what to do to prevent cooking odors and smoke from spreading over the whole house? It is particularly annoying when friends pay a visit. Any handy piece of board the length of the window can be attached as a shelf. It should be about three - quarters of an inch thick and can be fastened in place with a pair of brackets and a few screws. On this the fan is placed so as to face the open window and create a strong suction. In a short time the smoke and odors will have vanished. Also to beautify the kitchen a flower or two may adorn the other end of the shelf.



Drying Stockings and Gloves.

Something we all dislike is the unpleasant odor that is the result of a room or rooms having just been painted. With the windows kept open a few inches at the top and bottom and with our friend, the electric fan, kept going, the paint will dry quickly and the odor will have vanished in a much shorter time than had it not been used. Incidently dust will have been prevented from settling on the wet paint; also, it having dried more quickly, there will be a marked luster added to the painted surface. The fan can also be played on any small article that has been painted or enameled, such as a kitchen chair or table.

Humidifying and Deodorizing.

Gas heaters were never in such favor as they were last year and will be this year (the coal problem still being the chief reason). As a rule, with the oncoming of a substitute, some unfavorable feature is bound to spring up—in this case the reduction of humidity—the gas flame consuming a high percentage of the precious vapor which contains the oxygen, so necessary to our lungs. The electric fan again clears the situation. Place a pan about three-quarters full of water anywhere convenient, so that the fan can play directly across it. Over the pan put a thin board or piece of heavy cardboard, which has been perforated a number of times, so that small wicks or pieces of cloth can fit snugly into the perforations. They should be long enough to pass down into the water. The board or cardboard should be of the correct size so as to exactly suit the handles, and so be held in position; it should not be blown off by the fan. This arrangement need not necessarily be kept for a great length of time in one room, but it can be employed for a short period in every room, especially in bedrooms and sick rooms to promote comfort and good respiration, which in turn produce sound healthful sleep. A fan should invariably be kept in the sick room so as to insure good ventilation. It should of course be turned away, and at a considerable distance from the patient. It will greatly ease his suffering and discomfort which come from the difficulty of breathing and from the inability to sleep. The fan can be kept going at intervals and near a slightly lowered window. As the impure air rises and escapes thru the upper opening of the window, and the pure air enters thru the lower section, a good plan would be to have a small shelf made to hold the fan near the upper opening, the suction pumping out the impure air. It should also

GIANT JUPITER AND HIS NINE MOONS

By ISABEL M. LEWIS

Copyright, 1918, by E. P. Co.

Jupiter as Seen from Its Nearest Moon—Satellite V. This Tiny Moon Is Only 67,000 Miles from the Surface of Jupiter. Its Diameter Is Less Than 100 Miles. The Black Spot on the Face of Jupiter Is the Shadow of Another Moon Projected onto the Giant Planet.

THE most beautiful object in the midnight sky during these winter months is the planet Jupiter, which will continue to be in excellent position for observation far into the spring. Upon New Year's Day Jupiter will be in opposition to the sun and therefore directly on the meridian at midnight. It is then seen at its best and will be visible thruout the night, rising in the east as the sun sets and setting in the west at sunrise.

Jupiter shines by reflected sunlight with twice the brilliancy of the brightest of the stars, Sirius. When seen during the midnight hours the remarkable, unflickering brightness of this largest and most distinguished member of the solar system at once serves to set it apart from the scintillating stars far beyond.

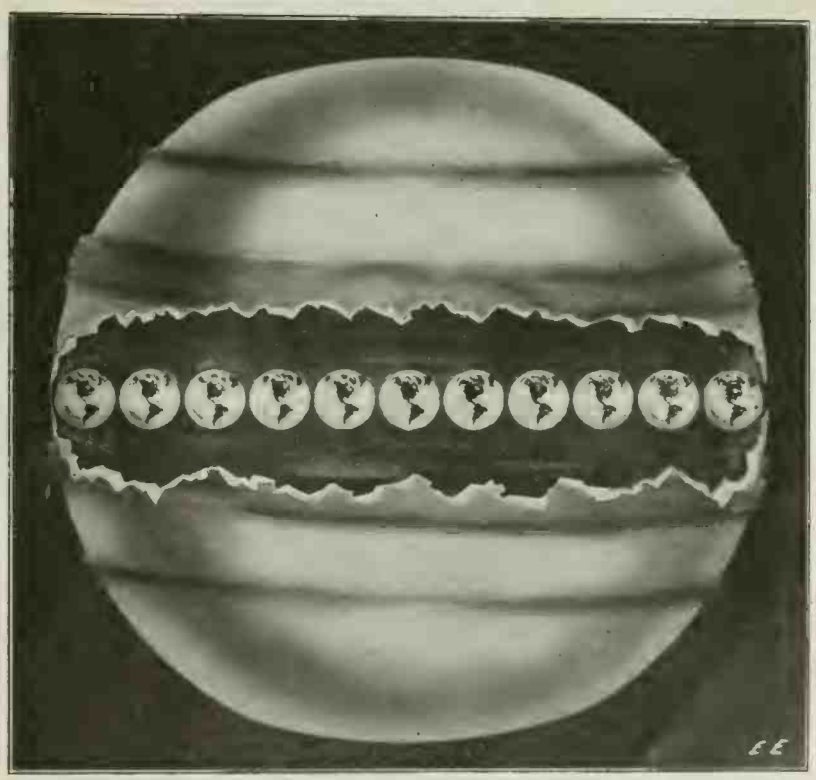
There is but one planet, Venus, that surpasses Jupiter in brilliancy, and as Venus never departs more than forty-eight degrees from the sun Jupiter always shines without a rival at midnight. To one who has observed the two planets together the silvery radiance and surpassing brilliancy of Venus, due not to its size, but to its comparative nearness to the earth, at once serves to distinguish it from the golden yellow glow of Jupiter.

Even the smallest telescopes of two or three inch aperture will show the four historic moons of Jupiter which were the first celestial objects to be discovered when Galileo turned his crude telescope to the heavens in the year 1610.

Comparative Size of Jupiter and the Earth. 90,000 Miles in Diameter, Jupiter's Mass Is 300 Times That of the Earth.

The fact that these tiny points of light were actually revolving around the great planet was soon detected by the famous astronomer and we can imagine with what breathless interest he observed these satellites of another world whose discovery dealt such a severe blow to the old Ptolemaic theory that the earth was the center of the universe. It was not until the great telescopes of modern times were invented that the five additional moons of Jupiter were discovered. The four satellites first observed by Galileo were fancifully named Io, Europa, Ganymede and Callisto, in the order of their distances outward from the planet, but these names are rarely used now, the satellites being designated for convenience I, II, III and IV, respectively. The first of the new satellites to be discovered was Satellite V, which is the nearest to Jupiter of all the nine moons. It is an extremely small body, not more than one hundred miles in diameter, and to discover this tiny body as it skirted rapidly around the great planet within sixty-seven thousand miles of its surface, nearly lost in the glaring rays, was a diffi-

www.americanradiohistory.com



Jupiter Photographed October 19, 1915, with the 24-inch Refractor by E. C. Slipher of the Lowell Observatory.

cult feat even for an experienced observer. It was accomplished, however, by Prof. Barnard with the great Lick refractor in 1892. Satellite V is hopelessly beyond the reach of any but the greatest telescopes, as are also the four satellites discovered since that date. In fact, most of these tiny moons are observed photographically. Satellites VI and VII were discovered photographically in 1905. They are both about seven million miles from the planet and their paths loop thru one another; they are, moreover, highly inclined to each other at an angle of nearly thirty degrees. When nearest together they are separated by a distance of two million miles. Two more extremely small bodies, known as Satellites VIII and IX, have been discovered quite recently, one at Greenwich, England, in 1908, the other at the Lick Observatory in 1914. These excessively faint bodies are the most remote satellites of Jupiter and they are of particular interest because they travel around the planet in a direction *opposite* to the direction of revolution prevailing in the solar system. The ninth and most distant satellite of Saturn also retrogrades; that is, it revolves in a clockwise rather than a counter-clockwise direction around the planet. One explanation given for this peculiarity of the outermost satellites of Jupiter and Saturn is that this backward revolution around the planet is more stable when the satellites are at great distances from the primary and the gravitational control that the planet exerts, therefore weak. The moons of the planets are, of course, subject to the attraction of the sun as well as to the attraction of the controlling planet, and the greater the distance of the satellite from the planet the stronger the pull exerted by the sun and the weaker the bonds that bind such a moon to the planet. Beyond a certain limit it would be impossible for the planet to hold the satellite against the sun's greater attraction and the satellite would leave the planet to revolve directly around the sun, thereby becoming a planet. It appears that as this danger limit is neared it is safer for the satellite to "back" around the planet than to follow the usual "west to east" direction of revolution. The eighth satellite of Jupiter is more than fourteen million and the ninth more than fifteen million miles from the parent planet and they require about two years and three years, respectively, to complete one trip around Jupiter. When we consider that Satellite V darts around the planet in less than twelve hours at a distance of only sixty-seven thousand miles from its surface we realize what tremendous differences exist in the distances and periods of revolution of the nine moons. There is also great disparity in the sizes of the various moons. The five moons discovered in modern times are all excessively faint and therefore extremely small. The diameter of the largest of these, Satellite V, is less than one hundred miles. On the other hand, the four historic moons of Jupiter are of planetary dimensions. The smallest, Satellite II, is slightly larger than our own moon, while the largest, Satellite III, has a diameter according to measurements made with the 40 in. Yerkes refractor in 1916, of three thousand nine hundred and eight miles, which is only four hundred miles less than the diameter of Mars. The periods of revolution of these four satellites range from one day and eighteen hours for the nearest, which is about two hundred and sixty-one thousand miles from the center of Jupiter, to sixteen days and sixteen and one-half hours for the most distant, which is more than one million one hundred and sixty thousand miles from the planet. These four moons of Jupiter are most interesting members of the solar system. They are so near to the great planet that they are continually dipping into his huge shadow and experiencing an eclipse of the sun's rays, which, owing to the nearness and great size of Jupiter, lasts for two or three hours. At times of eclipse the moon suddenly disappears from the observer's view, tho it may be considerably to one side of the planet. Its reappearance later on is just as sudden, or it may pass out of the shadow while hidden from us behind the disk of the planet, in which case its reappearance is invisible from the earth. The occultations of the satellites, or, in other words, their disappearance behind the planet's disk, are also interesting phenomena to observe, as are their "transits" across the disk of the planet as the satellite passes in front of the planet. Not only the satellite itself but its shadow as well can be seen, a small black dot passing over the surface of Jupiter. The satellite is totally eclipsing the sun for this small dark portion of the planet. Two satellites and their shadows are frequently seen crossing the face of the planet at the same time. It is possible to observe all the phenomena of the satellites' transits and shadows, eclipses and occultations with very small telescopes. From observations of the eclipses of Jupiter's satellites the important discovery of the finite velocity of light was first made as far back as the year 1675.

Faint surface markings have been made out at certain times on the largest of the four satellites, Satellite III, and also on Satellite I, or Io. Observations of the markings on the former seem to indicate that it always keeps the same face turned toward Jupiter as does our own moon toward the earth.

There are also reasons for believing that the equatorial regions of Satellite I are light colored and the polar regions dark.

An All-Electric Hot Air Balloon

THE captive balloon as used by the Allied armies at the present time is invariably filled with hydrogen or other gas supplied from steel bottles containing this gas stored at a high pressure, or else it is obtained from manufacturing supply stations on the field. The first balloons ever used—the old "Montgolfières" of 1783—were made to rise by means of hot air, for, as we all know, heated air is lighter than cold air, and will always rise. If the heated air is of sufficient volume, it will also carry a body up with it, such as a balloon envelope for example. All of us have seen the simple balloons which patriotic Americans are wont to liberate on the Fourth-of-July, and which are composed of nothing more than a balloon-shaped paper bag at the bottom opening of which there is secured either an absorbent wick containing gasoline, or a small alcohol lamp. We simply light the lamp, and after a short time the heated air rushing up into the balloon causes the envelope to become very light and it rises in the air. Some of these balloons will travel for miles, and years ago it was not an uncommon sight in Europe to see hot-air balloons ascend with several men.

There has always been, however, a serious objection to a hot-air balloon where the heater was of the flame or similar type, for there was always in this case the constant danger of the balloon becoming ignited, with disastrous results. It has remained for Mr. James N. Lewis of Detroit, Michigan, to invent and patent an all-electric hot-air balloon, which is illustrated in detail in the accompanying illustration. Mr. Lewis makes use of an automobile winch to haul in the balloon, and to act as a mobile station, a trailer being hooked behind the winch, in which to carry the balloon bag and basket while being transported from one point to another. Either the automobile engine or a separate gasoline engine mounted on the truck drives a dynamo, which supplies current for an electric heater in the balloon. By means of suitable clutches, the engine may be caused to drive the dynamo, or else thru a chain drive, it may be connected up to rotate the cable winch drum. The dynamo makes connection to a duplex power cable reeled around the drum, and this leads up to the balloon basket. Also the telephone circuit is carried up to the balloon thru the drum or otherwise, so that those on the ground are in telephonic connection at all times with the observer in the balloon basket, and under battle conditions he would also be in telephonic communication at all times with "field headquarters," so as to report the position of enemy guns, troops, etc.

A New Form of Heated Air Balloon, the Air in the Bag Being Kept Continually Hot, to Any Degree Desired, by an Electric Heater in the Neck of the Envelope. Current is Sent Up to the Balloon Basket from a Gasoline Engine-Dynamo Set Mounted on the Truck Below. Telephone Connection Between the Truck and the Observer Aloft is Available. A Motor-Blower Drives Heated Air into the Balloon Envelope.

Referring to the balloon in detail, we find that it is provided with an electric grid heater, and also a motor-driven blower and connecting tube, so that whenever the blower is operated, air is pumped up into the balloon envelope, the air passing thru the electric grid heater. The balloon bag is fitted with a suitable damper in the lower opening and a relief valve at the top in the usual manner, the relief valve being connected to the observer's basket by means of a small rope. When it is desired to descend, the observer may open the motor blower switch in the basket, and thus aid the hauling in of the balloon, for as the temperature of the air within the balloon bag falls the balloon naturally tends to descend toward the earth.

8,700,000 AMERICAN HOMES LIGHTED BY ELECTRICITY.

From the compilation made by the *Society for Electrical Development* it is shown that there are 20,689,000 families in this country, of which 7,000,000 have yearly incomes of $900 or more. However, the yearly average family income before the war was under $626.

Over 13,000,000 families are too poor, too illiterate, or otherwise unfitted to buy electrical goods. Over 8,700,000 homes are electrically lighted and 120,000,000 sockets contain Mazda lamps. In over 30,000,000 sockets are carbon lamps. It is estimated that 9,000,000 sockets are empty.

Homes lighted by other means, 15,000,000; some are wired but not connected up for service. Electric service is available in 10,613 communities of the United States, compared with 3,545 communities that are being served with gas.

ELECTRIC SEARCHLIGHTS.

Ranges of electrical searchlights vary from between one thousand to two thousand yards in foggy weather to ten thousand yards or more when the air is very clear. The average sea range is approximately six thousand yards, but there are cases on record where ships have been spotted at a distance of nine miles. These figures are based on a sixty-inch mirror and a twenty-thousand watt arc.

The City of Splendid Night

By AMOS STOTE

A 20th Century poet strolled at night enraptured thru the highways and byways of Manhattan, agleam in all her nocturnal glory —not one night, but many nights—some moonlit, others rainy, but always—the magic of millions of electric lights threw its spell over him. And as he walked along this street or that, or mayhap thru the park, or along the shimmering Hudson, the very soul of the city seemed to commune with him. The poet's name was Amos Stote, and he has here set down three literary gems describing New York City at night as it appealed to him. We like Mr. Stote's soulful word-pictures of the Greater City electrified—he gives us something to think of besides the lights themselves. Thought is the keystone of all intellectualism. Our poet has given us a new pair of soul spectacles thru which to view many splendid sights—which the everyday man never as much as suspects.

"Blot Out the Stars! Let the Skies Open Every Pore. . . . Fields Are Sodden, Villages Sordid. . . . But Old New Amsterdam Is Glorious. The Romance of Masonry and Electricity Is Before You. It Is a Drama Done In Pouring Pantomime."

THERE is a habit, born of Manhattan, that comes to possess the souls of men who wander thoughtfully. It is the habit of night. Not the star-strewn night of mountain tops where God's myriad incandescents sow the skies. Not those shores concerning which poetic folk write rhapsodies around the central station of the heavens. (To me the moon across the sea is a great searchlight laying a restless path that I long to follow.) No, it is not to mountain or shore, not even to deep, mysterious woods, where the firefly sprinkles sparks amid green leaves, that I would go in quest of those good men who have the habit of night.

To these men, and to me, the night of nights is to be found in the rugged, slumberless zone of Manhattan and its fringes of resting streets. Perhaps you know those softened hours that tread upon the heels of the noontide of the night, those hours that have gained a new, entrancing charm because—because of a man named Edison.

In the old days of shrouded streets, when darkness threw a mantle of mourning over the city, good men went in groups for safety sake. Then only the brave and the brute cruised singly abroad, for of course we except the gallant, suffering from love's fever. But now a million gleams of light insure the safety of the streets and give the night-bedecked city over to the admiring glances of those who have learned the beauty that lies in the silent battlements of commerce; and in the old homes and highways.

I have wandered down unfavored streets, idle channels from which the thinning traffic of the closing day has been diverted into the congested spillways of frivolity. Here, along these hushed courses, where life dozes on the border of gaiety, as an outworn chaperone naps in the antechamber to the ballroom, here I have seen ancient doorways with the beauty of the binding of a rare first edition.

Once upon a time periwigged and gouty old gentlemen, and haughty grand-dames, past in and out these doors. On state occasions, when they ventured forth at night, armed servants escorted them and fleet-

Prussianizing the American Ether

By H. GERNSBACK

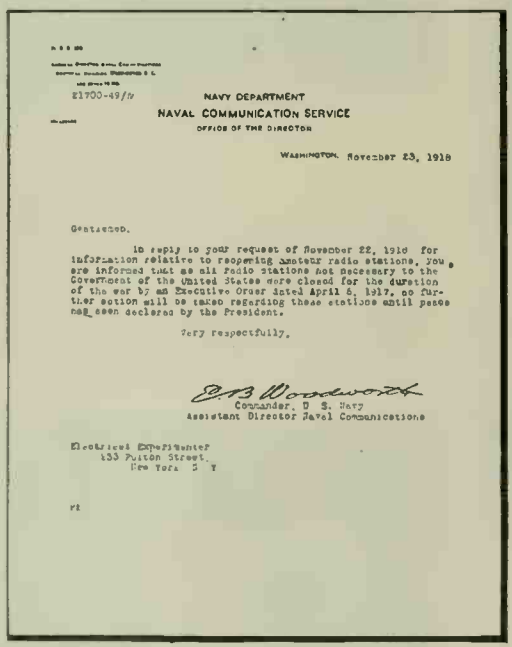
WHEN, on April 6, 1917, the President of the United States, by executive order, closed all wireless stations, the order was carried out to the letter by all Radio amateurs willingly and cheerfully. No notice has come to our attention where an amateur disobeyed the President's wishes.

All amateurs stood solidly behind the President when war was declared because all realized that everyone had to bear great sacrifices willingly and cheerfully. When the armistice was finally signed, the whole world breathed a sigh of relief, including the American amateur who had been given to understand that as soon as peace was actually declared the ether would be free for all once more. The amateurs were satisfied to go back to pre-war conditions, to take up their studies in an art which has few parallels as far as instruction and ennobling of the mind is concerned.

Unfortunately, however, in certain quarters in Washington, a feeling seems to exist that the amateur at best is a nuisance and should be done away with entirely. On November 21st two identical bills were introduced, Senate 5036 and H. R. 13159, the former by Senator Fletcher, the latter by the Honorable Joshua W. Alexander. These bills are reproduced elsewhere in this issue, as well as a statement given out by the Navy Department. The Navy Department frankly admits that these bills are not a war measure and it also endorses these bills. The Navy Department also makes the extraordinary statement that "experimenters" and scientists will not be interfered with, to wit:

IT SHOULD BE NOTED THAT THIS BILL IS NOT TO CREATE A COMPLETE GOVERNMENT MONOPOLY. THE SCIENTIST, MANUFACTURER, AND SHIP OWNER ARE SPECIALLY PROVIDED FOR, AND NO CHANGE IS PROPOSED IN THEIR STATUS UNDER EXISTING LAW. STATIONS MAY BE LICENSED FOR SPECIAL COMMUNICATION, AND THESE ARE EXEMPTED FROM GOVERNMENT OPERATION.

Any intelligent person reading this paragraph must come to the conclusion that amateurs would revert to their *ante bellum* days the minute peace was declared by Presidential proclamation.



So far, so good. We now turn to the Alexander and Fletcher identical bills, and read them attentively. To our amazement not a word is mentioned about the amateur. This bill also contains the extraordinary statement that:

"Experiment station means a radio station actually used for conducting experiments for the development of the science of radio communication or the apparatus appertaining thereto, and used for no other purpose except as a technical and training school station."

In other words, a technical training school station is an experiment station and vice versa. Of course, this statement alone, unless modified means that if the bill is actually past by both Houses the amateur will be just as dead as that sensitive spot on a galena detector after it was hit by lightning.

A second reading of the Navy Department's statement also informs us that the President approved a similar bill: H.R. 2573.

We now turn our attention to this bill

21700-49/fv

NAVY DEPARTMENT
NAVAL COMMUNICATION SERVICE
OFFICE OF THE DIRECTOR

WASHINGTON, November 23, 1918

Gentlemen.

In reply to your request of November 22, 1918 for information relative to reopening amateur radio stations, you are informed that as all Radio stations not necessary to the Government of the United States were closed for the duration of the war by an Executive Order dated April 6, 1917, no further action will be taken regarding these stations until peace has been declared by the President.

Very respectfully,

E. H. Woodworth
Commander, U. S. Navy
Assistant Director Naval Communications

Electrical Experimenter
233 Fulton Street,
New York, N. Y.

rt

and read it carefully. We are struck with the fact that it was first introduced in the House of Representatives by Mr. Padgett under date of April 9, 1917, *a year and a half before* Messrs. Alexander and Fletcher introduced their bills. Strange to say, all the three bills read alike *except* that Mr. Padgett's bill right after the fifth paragraph, referring to the technical and training school stations, has the following:

> The term "Amateur" station means any station not an experiment station or a technical and training school station and not operated for financial profit.

We also find in this bill, under Section 3, the following:

> This section shall not apply to experiment stations, technical and training school stations and amateur stations, duly licensed by the Secretary of Commerce as provided by the act to regulate radio, approved August 13, 1912.

Here the similarity ends. In all other respects the three bills read actually and almost entirely word for word the same. We heartily approve Mr. Padgett's bill, which also has the approval of the President as admitted by the Navy Department.

Now then, as Mr. Padgett's bill was introduced on April 9, 1917, and as Mr. Alexander's bill was introduced on November 21, 1918, one and one-half years later, and inasmuch as Mr. Alexander's bill reads exactly alike word for word all the way thru with the exception of the paragraphs mentioning amateurs, Mr. Alexander necessarily must have copied Mr. Padgett's bill. But when he came to the paragraphs mentioning amateurs he ran his blue pencil right over them.

And that is the joker. President Wilson approves of Mr. Padgett's bill favoring amateurs. Mr. Alexander with the stroke of his pen,—or was it the blue pencil?—wants to shut out the amateur from the ether forever.

Not that Mr. Alexander is not familiar with the amateurs. He knows them well. For Mr. Alexander was the author of the original radio bill before it was a law. The writer in 1912, as will be remembered by most amateurs, fought the Alexander bill for the reason that it did not make mention of the amateurs. Finally Mr. Alexander and his committee became convinced that it would be an injustice to silence the amateurs, and in April of that year the Alexander Wireless Bill *amended* appeared. As will also be remembered, Mr. Alexander and his advisers accepted the writer's recommendation pertaining to amateurs as set forth in the writer's editorial in the February, 1912 issue of *Modern Electrics*, and this bill later in the year was signed by President Taft, thus making it the present wireless law.

It strikes us as remarkable that inasmuch as in 1912 Mr. Alexander could not see the amateurs with an ultra-microscope, his eyesight as far as the amateur is concerned has not grown better in 1918. As soon as we knew that there was to be a new wireless measure, we got busy immediately and we found out that there will be a hearing of Mr. Alexander's bill on December 12th which will continue from day to day until all have had a chance to be heard. Inasmuch as this issue of the ELECTRICAL EXPERIMENTER does not come out until about the 12th of the month, it would have been impossible to inform all amateurs of the impending measures, and for this reason we took it upon ourselves to mail out at once some 50,000 letters broadcast to all amateurs giving them the facts of the case.

Of course it is not too late even now for those who have not received our letter. Mr. Alexander's bill has not as yet been

www.americanradiohistory.com

past, and we doubt very much if it will. What we want is Mr. Padgett's clauses reinstated—in other words, what we want as far as the amateurs are concerned is the passing of the bill H.R.2573, which has the full approval of the President, so admitted by the Navy Department; or, what amounts to the same thing we want Mr. Padgett's clauses regarding amateurs inserted in Mr. Alexander's bill. One is exactly the same as the other. This is all that we want, and it is fair to all concerned. It simply means that the present wireless law is to remain the same, and this, we are certain, will satisfy every amateur in the country.

The licensing system whereby the amateur was licensed by the Department of Commerce for the five years during which the law was in force, proved satisfactory to all concerned. No amateur has ever harmed anyone, and as the stations were licensed the amateurs refrained from sending out false calls or otherwise making a nuisance of themselves, a condition which prevailed before the 1912 wireless law was past.

It has been proved time and again that radio apparatus enormously sharpen the senses of a young man by making him keener all the way around, besides teaching him an art that is worth while.

Hundreds of thousands of radio amateurs in the Signal Corps have helped towards winning the war, and they will do so again when called upon. If it had not been for wireless, the United States would not have had such a large body of telegraphers at the outset of the war, and nearly all of these volunteered. Furthermore, radio telegraphy has been the great cause to keep the young man away from questionable company during his spare evenings, and this alone overbalances any criticism that could possibly be brought against the amateur. Any parent who has a growing son is thankful for being allowed to spend all he possibly can for radio apparatus because he realizes more than anyone else that it keeps together the home ties between son and home.

It is not too late as yet to protest against Mr. Alexander's bill, and those who have not as yet done so should write or wire to Mr. Alexander's committee at once. When you write refer to H.R. 13159 and address your letter to the Honorable J. W. Alexander, House of Representatives, U. S. Committee on The Merchant Marine and Fisheries, Washington, D. C.

A BILL TO FURTHER REGULATE RADIO COMMUNICATION.

Statement by the Navy Department.

This bill was introduced by Senator Fletcher, Chairman of the Senate Committee on Commerce, and by Judge Alexander, Chairman of the House Committee on the Merchant Marine and Fisheries, on November 21, 1918 (S. 5036 and H. R. 13159). A similar bill (H. R. 2573) has had the direct approval of the President, and the principles contained in the bill have the approval of practically all of the executive departments, as shown in the previous hearings before the House Committee on the Merchant Marine and Fisheries.

In general, the bill provides for the acquisition and operation, by the Navy Department, of all radio stations on shore used for commercial purposes. Irrespective of the general subject of government ownership, this principle is clearly indicated as necessary in the case of this particular public utility. Since the early days of the use of radiotelegraphy many companies have tried to operate radio stations as a commercial enterprise in the United States generally, or in certain localities. Except in very special circumstances, these enterprises have failed to make an adequate return, and in most cases no profit has been made except through the sale of stock. The reason for this is that a complete monopoly is necessary. That is, all stations must belong to one system. A period of about 18 years has clearly demonstrated that the United States Government is the only concern able to obtain and maintain such a monopoly, although many attempts have been made.

The first law regulating radio stations was enacted in 1912. At that time Congress recognized the fact that a complete system of radio stations having been established by the Navy Department for the national defense, the maximum public good could be obtained from them if they were permitted to assist commerce by handling the radio business of merchant ships. A certain number of naval radio stations were authorized to handle commercial business. This business has been successfully handled for four years. The Navy Department has demonstrated its ability to handle smoothly and efficiently, wherever permitted to do so, all communication between ship and shore, without any restrictions on the nationality of the ship or the ownership of the radio set on board, and quite irrespective of the ownership of the connecting land lines and cables to which the radiograms were delivered for further transmission if originating at sea, or from which traffic was received if destined seaward. The Navy Department is now prepared and desires to handle all commercial work of all stations.

The part played by high-power stations in this war and before the United States became a party to it, shows very clearly the necessity for Governmental operation of these stations. Transoceanic radiotelegraphy is not a serious competitor of the cables. High-power stations are not yet able to receive from one another all day in all seasons, cable communication is secret, while signals from radio stations are transmitted in all directions, and all nations can read the business of all others. Only the most carefully devised codes can make radio traffic secret, and experts will not admit that any code or cipher cannot be broken in time. Signals from high-power stations become international matter at once. Even the signals of an ordinary shore station transcend the three-mile limit and are capable of interfering with the legitimate work of an installation under a foreign flag. Only by the most careful regulation of radio traffic, through international agreement, can the maximum good be obtained, and only by each nation having the operation of radio stations under its direct control can international agreements be properly executed.

In spite of the claims of inventors, radio communciation is still hampered by atmospheric disturbances commonly termed "static" and by interference. In congested districts, as in the case of important seaports, communication is limited and must be controlled by a central organization, otherwise a serious situation ensues. In the case of high-power stations where there is a limit to the number of long wave lengths which can be used, interference is encountered regardless of the distance between stations. For instance, a station in Washington is liable to be interfered with by a station in San Francisco, while attempting to receive from France or Italy.

IT SHOULD BE NOTED THAT THIS BILL IS NOT TO CREATE A COMPLETE GOVERNMENT MONOPOLY. THE SCIENTIST, MANUFACTURER, AND SHIP OWNER ARE ESPECIALLY PROVIDED FOR, AND NO CHANGE IS PROPOSED IN THEIR STATUS UNDER EXISTING LAW. STATIONS MAY BE LICENSED FOR SPECIAL COMMUNICATION, AND THESE ARE EXEMPTED FROM GOVERNMENT OPERATION.

By agreement with the Department of Commerce, the licensing of stations above mentioned, the licensing of ship stations and of commercial operators for them would be transferred to the Navy Department, since naval operation of commercial shore stations would eliminate a number of the duties assigned to the Secretary of Commerce.

This is not a war measure. In accordance with the Act of 1912, all radio stations in the United States and possessions, which were not already in the Government's hands, were taken over by the Navy Department as a war measure, and are now being operated by that Department, promptly in April, 1917. Many changes have occurred during the war. Stations formerly operated commercially have been found to be unnecessary for either commercial or war purposes. On account of the submarine menace the necessity for instant control of troop convoys, and the sudden rise in importance of transatlantic communication for naval and military purposes, a few additional stations and some special arrangements were necessary on the Atlantic coast. The busi-

Radio Law and Existing Restrictions

By WILLIAM B. DUCK

The following interesting article by an attorney well versed in the subject, should answer the thousands of letters with which we, as well as all amateur Radio Supply Houses have been bombarded since Nov. 11th of this year.—EDITOR.

MANY wireless amateurs never had very clear notions concerning the regulations of Congress upon wireless sets, and fewer yet grasped the legal effect of the existing restrictions upon the use of such apparatus.

The existing wireless law derives its authority and likewise its legality from the so-called interstate commerce clause of our national constitution, giving to Congress the right to regulate commerce among the several states. Were it not for this provision in our constitution, Congress never would have had any authority to legislate upon any phase of this subject. Our national constitution embodies a wide variety of powers given up by the thirteen sovereign states when the constitution was adopted. All other powers and rights were reserved by the states. Consequently when Congress enacts any law, it must find its authority in some provision in the constitution. For instance Congress cannot pass any law regulating the rates of railroads both terminals of which are within the borders of the same state. The state only has such authority.

Our supreme court has given a very wide interpretation to the interstate commerce clause of our constitution. It has declared, for instance, that communication carried on by line wires extending from one state into another may be regulated by it. No wireless amateur has ever bothered to go to the expense of having the courts pass upon the question as to whether Congress has the power to license a transmitting station for exclusive use *between two cities in the same state*, if as an incident to this communication, the station may be heard beyond the borders of the state. In fact it is better for the amateurs that Congress compels the high power amateur stations to submit to its decrees in the regulation of their stations.

It is for this reason that the wireless law provides that no license is necessary for a receiving station or for a transmitting station with a range within the limits of the state where located. If Congress had attempted to exercise jurisdiction over these stations the entire law would have been unconstitutional.

When the United States entered the world war, the president, on April 6th, 1917, as Commander in Chief of the Army and Navy, ordered all the wireless stations dismantled. The existence of a previous law on this subject in no way added to his power to order the stations closed. It was a military act, and its authority was founded on recognized law on this subject, which it is unnecessary to discuss here. It will be observed that the order of the president embraced all wireless equipment, both transmitting and receiving. The moment peace is declared, all amateurs will "ipso facto," without promulgation of any decree by the president or any one else, have the right to use their receiving sets and small power transmitting sets whose range does not extend beyond the border of the state. A great many other war powers will likewise cease at this time.

Experimental Physics

By JOHN J. FURIA, A. B., M. A., (Columbia University)

LESSON EIGHTEEN

Conduction of Electricity Thru Gases.

GASES, the air included, under normal conditions will not conduct electricity. However, when a high potential is establisht between two points in a gas, as for example when a Wimshurst Machine is excited or a spark coil operated, the gas offers less and

Fig. 95-A. Vacuum Tube for Demonstrating That Cathode Rays Cast a Shadow. The Rays Travel In Straight Lines, as the Metal Cross and Its Shadow Prove.

less resistance as the potential is increased and finally electricity is discharged between the two points. The subject of the conduction or the discharge of electricity thru gases with its causes, effects and results is a vastly important one. It has attracted the attention of the foremost Physicists and has given rise to modern Physics with all its information regarding the *electron*.

Experiment 103

Attach the terminals of a spark coil to a pair of combs consisting of several needle points and keep the pair separated by a distance several times greater than the rated spark length of the coil. Darken the room and a glow will be observed surrounding the points. If more current is supplied to the coil so that a higher voltage is developed, the glow will increase in size and intensity. This glow is technically known as a *brush discharge* or *corona*, see Fig. 93-A. Now bring the terminals of the spark coil close together. A spark jumps across the gap in a straight line path. See Fig. 93-B. As the terminals are gradually separated the spark passes thru an irregular path until finally the limit of the coil is reached and no spark passes. The *spark discharge* then differs from the brush discharge in that the former is the passage of electricity from one point in a gas to another point and the latter is the passing of a gas from a point into the surrounding gas. As more current is past thru the primary of the spark coil a higher potential is developed at the secondary terminals and therefore a longer spark is produced, i. e., the length of the spark is proportional to the potential; a *one inch spark being produced by a potential of about* 30,000 *volts.*

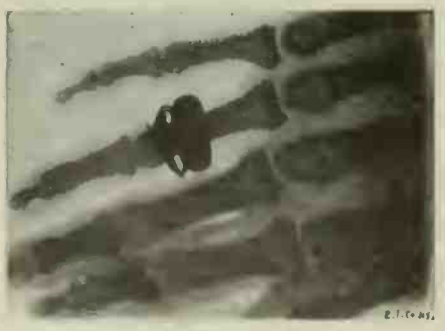

Fig. 97-B. Typical X-Ray View of the Hand, Showing Rings on the Finger.

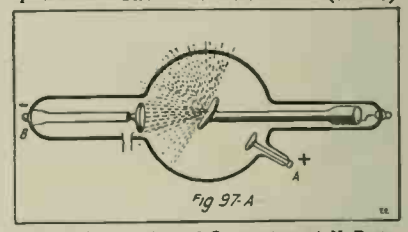
Experiment 104

A straight glass tube about an inch and a half in diameter and fifteen inches long has platinum electrodes attached to aluminum discs. An air pump is connected at the opening *a*. The electrodes are connected to the secondary of a spark coil and also to the spark gap in figure 94, the gap being smaller than the rated spark of the coil. If the coil is now operated, a spark passes thru the gap *g* and nothing is observed in the tube. As the air in the tube is gradually exhausted by the pump the spark thru the gap disappears and a discharge is seen thru the tube which is neither spark nor brush. It will have the appearance of a ribbon of crimson light. The discharge then broadens out into a bluish, fuzzy column. When the pressure reaches about five-tenths of a millimeter of mercury, the negative electrode (cathode) becomes covered with a thin luminous layer. Next to this we find a dark space known as *Crookes' dark space,* next to which is a luminous part called the *negative glow,* and beyond this a second dark region known as

Fig. 96. Deflection of Cathode Rays by a Magnet. The Screen a-b Is of Fluorescent Material, So as to Make the Rays Visible.



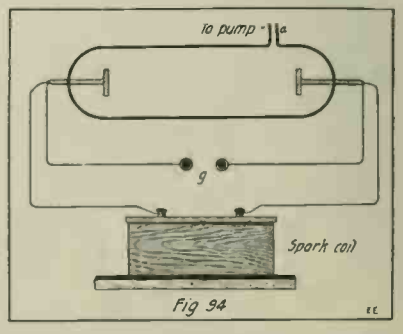
the *Faraday dark space.* From this space to the positive electrode we have the *luminous positive* column. By adjusting the pressure slightly the positive column can be made to divide up into a series of luminous and non-luminous spaces called *striae.* (Geissler tubes are partially evacuated tubes bent into fancy shapes and surrounded with jackets containing colored liquids to produce pretty color effects.) If the pressure is lowered still further, to about 1/100 part of a millimeter, the column will gradually disappear and the walls of the tube will begin to fluoresce, the fluorescing color depending on the nature of the glass. This fluorescence is produced by streams of small particles issuing from the cathode and we consequently call them *cathode rays.* This fluorescent property of cathode rays is useful as a means of detection and observation of the rays. Glass is not the only substance to fluoresce under the bombardment of cathode rays. Calspar, barium platino-cyanid, potassium cyanid, yttrium and thorium also fluoresce.

Experiment 105

Cathode rays travel in straight lines and hence form shadows when striking an obstruction. In figure 95A *c* is the cathode. A piece of metal hinged at its lower end stands in the path of the rays. A distinct shadow of the same shape as this obstructing metal is formed at the end of the tube. On dropping the metal down at the hinge by shaking the tube the shadow disappears.

Experiment 106

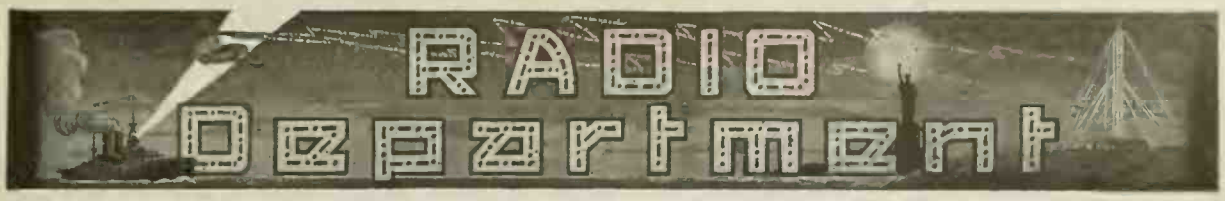
In figure 95B the cathode is concave and spherical. The other electrode (anode)



For the Production of Concentrated X-Rays, a Special Form of Focus Tube Is Used. Cathode Rays Coming from the Concave Electrode at Left, Converge and Strike Platinum Target at Right, Where X-Rays Are Generated.

consists of a small piece of very thin sheet platinum. The cathode rays are converged, focus on the platinum and are therefore very concentrated. The platinum incandesces, showing the heating effect of the cathode rays. Of far greater importance than either the fluorescent, the shadow, or the heating effect is the *magnetic effect,* especially as this gives us an insight into the nature of the cathode rays.

Experiment 107.



In figure 96 *a-b* is a fluorescent screen of zinc sulfid, or barium platino-cyanid; *c* is a mica strip with a narrow slit in it. The cathode rays emerging at *d* are absorbed by the mica *c,* except for a small part passing thru the slit. These travel straight thru for the full length of the tube and cause a narrow band of the screen *a-b* to fluoresce brilliantly. Hence, the path of the rays, which are themselves *invisible,* is readily seen. If now a horseshoe magnet is brought near the tube the rays are deflected toward it at right angles to the magnetic field. This is precisely what would happen if the cathode rays con-

The Effect of Statics on Wireless Transmission

By NIKOLA TESLA

Written for the ELECTRICAL EXPERIMENTER

A FEW statements regarding these phenomena, in response to a request of the ELECTRICAL EXPERIMENTER, may be useful at the present time in view of the increasing interest and importance of the subject.

The commercial application of the art has led to the construction of larger transmitters and multiplication of their number, greater distances had to be covered and it became imperative to employ receiving devices of ever increasing sensitiveness. All these and other changes have cooperated in emphasizing the trouble and seriously impairing the reliability and value of the plants. To such a degree has this been the case that conservative business men and financiers have come to look upon this method of conveying intelligence as one offering but very limited possibilities, and the Government has deemed it advisable to assume control. This unfortunate state of affairs, fatal to enlistment of capital and healthful competitive development, could have been avoided had electricians not remained to this day under the spell of a delusive theory and had the practical exploiters of this advance not permitted enterprise to outrun technical competence.

Tesla's Static Eliminator, Patented and Used by Him over Twenty Years Ago. It Will Be Fully Described in an Early Issue of the Electrical Experimenter

With the publication of Dr. Heinrich Hertz's classical researches it was an obvious inference that the dark rays investigated by him could be used for signalling purposes, as those of light in heliography, and the first steps in this direction were made with his apparatus which, in 1896. was found capable of actuating receivers at a distance of a few miles. Three years prior to this, however, in lectures before the Franklin Institute and National Electric Light Association, I had described a wireless system radically opposite to the Hertzian in principle inasmuch as it depended on currents conducted thru the earth instead of on radiations propagated thru the atmosphere, presumably in straight lines.

The apparatus then outlined by me consisted of a transmitter comprising a primary circuit excited from an alternator or equivalent source of electrical energy and a high potential secondary resonant circuit, connected with its terminals to ground and to an elevated capacity, and a similar tuned receiving circuit including the operative device. On that occasion I exprest myself confidently on the feasibility of fiashing in this manner not only signals to any terrestrial distance but transmitting power in unlimited amounts for all sorts of industrial purposes. The discoveries made and experimental results attained I made with a wireless power-plant erected in 1899, some of which were disclosed in the Century Magazine of June, 1900, and several U. S. patents subsequently granted to me have, I believe, borne-out strikingly my foresight. In the meantime the Hertzian arrangements were gradually modified, one feature after another being abandoned, so that now not a vestige of them can be found and my system of four tuned circuits has been universally adopted, not only in its fundamentals but in every detail as the "quenched sparks", "ticker", "tone wheel", high frequency and rotating field alternators, forms of discharges and mercury breaks, frequency changers, coils, condensers, regulating methods and devices, etc. This fact would give me supreme satisfaction were it not that the engineers, misinterpreting the nature of the effects, are making installments so defective in construction and mode of operation as to preclude the possibility of the great realization which might be brought within easy reach by proper application of the underlying principles and one of which—the most desirable at present—is the complete elimination of all static and other interference.

During the past few years several emphatic announcements have been made that a perfect solution of this problem had been discovered, but it was manifest from a casual perusal of these publications that the experts were ignoring certain truths of vital bearing on the question, and so long as this was the case no such claim could be substantiated. I achieved early success by keeping these steadily in mind and applying my efforts from the outset in the right and correct scientific direction.

I may contribute to the clearness of the subject in answering a question which I have been asked by the Editors of the ELECTRICAL EXPERIMENTER with reference to the report contained in the last issue, that signals had been received around the globe. an achievement the practicability of which I have fully demonstrated by experiment eighteen years ago.

The question is, how can Hertz waves be conveyed to such a distance in view of the curvature of the earth? A few words will be sufficient to show the absurdity of the prevailing opinion propounded in text books.

We are living on a conducting globe surrounded by a thin layer of insulating air, above which is a rarefied and conducting atmosphere. If the earth is represented by a sphere of 12½" radius, then the layer which may be considered insulating for high frequency currents of great tension is less than 1/64 of an inch thick. It is held that the Hertz waves, emanating from a transmitter, get to the distant receiver by successive reflections. The utter impossibility of this will be evident when it is shown by a simple calculation that the amount of

The Above Illustration Shows an Ingenious German Method of Generating Electricity for a Wireless Installation in the Trenches, Captured in a British Advance. A tandem bicycle with its Wheels Removed Has Been Fixt to the Ground, and the Pedal Wheels Connected by Belting with a Small Dynamo.

Such an outfit will produce considerable electricity which can be used for radio or lighting purposes, etc. In fact, this scheme is not new to the American wireless amateur, for we published an article on such a device for producing current to operate a wireless transmitter several years ago. A person sitting on a bicycle fitted with proper gearing, exerts a great deal more power than would be imagined off hand, and besides for warfare requirements the outfit is noiseless, albeit it is not quite so handy as the small gasoline engine outfits used by some of the other armies.

NEW TELESCOPING RADIO TOWER.

A device that promises to be of great importance to the field wireless service is a telescopic tower that can be rasied almost instantly on the throwing of a lever. This tower, the invention of R. W. Dean, of Des Plaines, Illinois, has been presented to the Government, says *The Oscillator*.

The tower that carries the wireless aerial works on an extremely simple principle. A number of light steel pipes fit inside of one another, the space between them being made air-tight by a series of washers at the top of each but the middle pipe. The base-pipe connects with a comprest-air reservoir which is always kept filled by an air-pump.

The operators turn on the comprest air lever. Air from the tank rushes to the top of the innermost pipe and pushes up on it with a force upward of twenty-five pounds for every square inch of its surface. The sections shoot upward, one after another.

Of the 8,000 girls who applied for service as military telephone operators with the American forces abroad 650 were accepted.

No Wonder the Naval Radio Students at "Harvard" Get a Headache Now and Then. Excuse Him, Folks, If He Don't Write Every Day. The Boy Is Busy! What?—Courtesy the "Oscillator."

Marconi Company Claims Famous "Static Preventer" Discovery

"With the conditions that pledged us to absolute secrecy no longer prevailing, the Marconi Wireless Telegraph Company of America is permitted to announce a discovery and invention in wireless telegraphy that will mark a new era in world communication," says a statement issued by Edward J. Nally, Vice-President and General Manager of the Marconi Wireless Telegraph Company of America.

"Ever since the genius of Marconi made wireless telegraphy a fact, the only limitation of this method of communication was the deadly phenomena of 'static conditions.'

"It remained for an American radio expert, Roy A. Weagant, Chief Engineer of the Marconi Wireless Telegraph Company of America, to discover the solution of the static problem.

"Among the revolutionary changes that the new system effects in wireless installations will be the immediate disappearance of the huge steel towers, heretofore built at great heights to catch the incoming wireless waves. Equipt with the Weagant invention, the wireless receiving antennæ are stretched merely a few feet above the ground.

"Heretofore, also, the increasing number of high power stations that were being erected in every part of the world raised the difficult question of 'interference.' Crossing wireless messages that shot thru the ether sometimes made the wireless signals so indistinct that they could not be understood, or drowned the weaker transmission entirely. The Weagant system, based on a unique selective principle, eliminates 'interference' and permits absolutely clear communication, regardless of the operation of other stations even in the immediate vicinity.

"The notable contribution to wireless telegraphy opened by Mr. Weagant's discovery makes continuous wireless communication over the oceans and between continents an absolutely assured fact for twenty-four hours of the day and at every season of the year, regardless of atmospheric conditions. All the Marconi high power stations are being equipt with the Weagant system, and the stations of the Pan-American Wireless Telegraph and Telephone Company, which are to link North and South America, will likewise be equipt."

This invention sounds almost too good to be true. However, Mr. Weagant, in an interview with the ELECTRICAL EXPERIMENTER's representative, stated that by very careful study of the subject over a considerable period, discovery of an entirely new basic principle had been made, and by accident at that. It was not expected, but while making investigations along other lines this particular effect became more and more noticeable until it developed into a full-fledged invention. "As soon as official 'Peace' is declared," said Mr. Weagant, "I will present a technical paper before the Institute of Radio Engineers, describing the invention. Also a body of technical men will be invited to one of our stations to hear it work."

SHIPS PERMITTED TO USE RADIO AGAIN.

Announcement has been made by the Naval Communication Service that commercial wireless traffic between United States merchant vessels and naval radio shore stations would be resumed at once.

This means that wireless messages may be sent to passengers on board steamships and that travelers at sea may communicate with shore.

During the war steamships were forbidden to use their wireless except to listen, the precaution being taken to prevent submarines and surface raiders from learning of the positions of Allied vessels.

OCTOBER MEETING OF INSTITUTE OF RADIO ENGINEERS.

The Institute of Radio Engineers held a meeting on the evening of Wednesday, October 9, 1918, in the Engineering Societies Building, New York.

A paper on "SPECIAL HEATING EFFECTS OF RADIO FREQUENCY CURRENTS," by PROF. EDWIN F. NORTHRUP of Princeton University was given.

www.americanradiohistory.com

Radiotelephone Guided U. S. Flyers Many Miles Away

SQUADRONS of American airplanes fighting in France up to the moment of the armistice, were maneuvering under the vocal orders of the squadron commander that reached each pilot by radiotelephone.

News of the successful development of this device, hitherto a military secret, tho some inkling of it had reached the Germans just before hostilities ceased, was made public recently by John R. Ryan, Director of Aircraft Production.

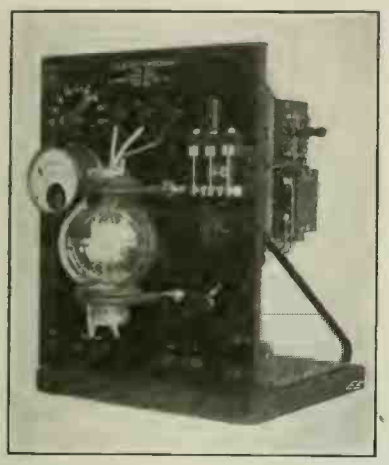

Fig. 5. High Power Oscillion Bulb Radiotelegraph Transmitter. The Meter At the Left of the Panel Is a Hot-Wire "Radiation Current" Indicator.

"There are some details concerning it which we cannot discuss yet," Mr. Ryan said, "but the radio devices worked out during months of experiment went into actual service some weeks ago. I have myself, standing on the ground, given orders to a squadron flying in the air and watched them maneuver accordingly.

"The transmission of the voice is clear enough to be heard distinctly thru the sound of the airplane motor. It is in every way the most satisfactory means of communicating between 'planes in the air and from the ground to 'planes."

The distance over which the radiotelephone talks from earth to 'plane is a matter of several miles.

"For some months," said William C. Potter, of the Equipment Division of the Bureau, "it has been possible in our offices in Washington to hear the 'planes flying miles over the city, talking to each other and to the ground as they worked out and perfected the device."

The accompanying views show several new wireless telephone apparata which can also be used for wireless telegraphic transmission when desired and utilizing the De Forest *Oscillion* bulb, having a filament, grid and wing. The oscillion comprises an exhausted glass tube or bulb, the size of which depends upon the output in watts, and which greatly resembles an ordinary incandescent lamp. This bulb contains two additional elements besides the usual incandescent filament, which are known as the *plate* and *grid* respectively. In these oscillions, the grid consists of a spiral winding of very fine tungsten or other wire wound upon a glass frame, and so placed as to entirely surround but not touch the filament. The plates, of which there are two, are placed one on each side of the filament, outside of, but not in contact with, the grid. In operation, the oscillion or vacuum bulb, oscillation generator requires two sources of potential, one of low voltage for lighting the filament, and one of high potential for supplying current from plate to filament across the vacuous space within the tube. A small motor-generator suitably wound to supply the proper voltage is generally employed as the most convenient source of current. Reception of radio-telephonic or telegraphic waves is accomplisht by the use of a similar but smaller sized vacuum bulb, which is capable of generating oscillations by a re-action between two or more tuned circuits, so that either damped or undamped oscillations can be interpreted.

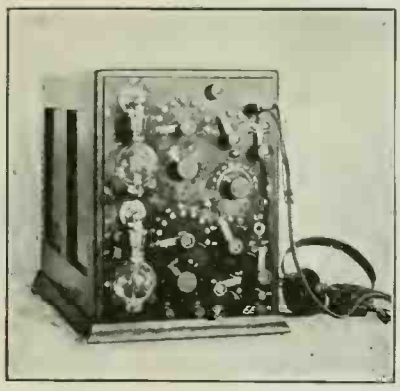

Fig. 2. New Combination Audion, Ultra-Audion and One-Step Amplifier Designed By de Forest.

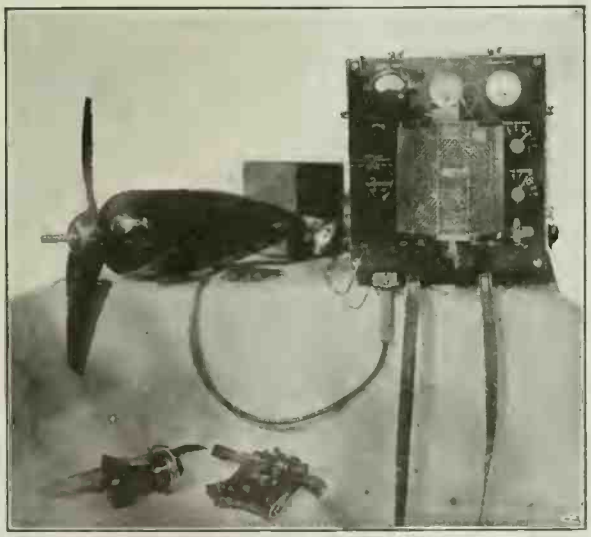

Fig. 1. Complete Airplane Radiophone Oscillation Transmitter Fitted With Self-Exciting Generator of the Wind-Driven Propeller Type (Left), "Chopper" Calling Key and Oscillion Bulb In Guard.

Fig. 1 of the accompanying views shows a complete airplane Radiophone oscillation transmitter, especially designed for military use. In this set the weight has been reduced to a minimum. A special *chopper* or calling key is fitted to the instrument as well as a special type of microphone for modulating the oscillations in the form of speech waves. At the left of the photograph will be observed a small dynamo resembling an airplane bomb, one end of which is fitted with a small size propeller. This dynamo is driven by the force of the air turning the propeller, as the airplane speeds along, and thus current is produced for the operation of the oscillion. The large oscillion bulb is enclosed in a wire cage to protect it from breakage, and the necessary measuring instruments are mounted on the front of the panel, viz: a hot wire ammeter in series with the antenna circuit to measure the radiation current, a milli-ammeter indicating the "B" battery current, and a filament battery ammeter. Suitable tuning inductance and capacity control knobs are mounted on the front of the panel. The connections between the various parts of the apparata are accomplisht with flexible twin conductors sewn in leather straps, the ends of which are provided with separable jack plugs.

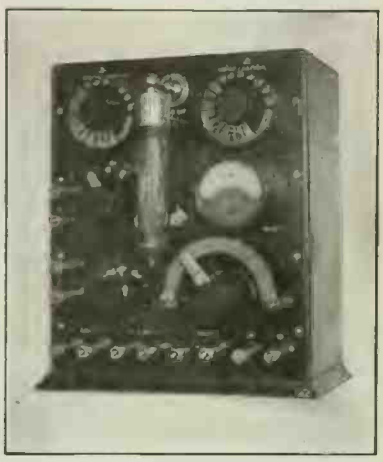

Fig. 4. New Vacuum Tube Control Cabinet. 110 Volt Direct Current Is Frequently Used On These Sets for the Wing Circuit, Using a Suitable Potentiometer in the Circuit.

The illustration in Fig. 2 shows a combination audion, ultra-audion and one-step amplifier. This combination is similar to the audion two-step amplifier outfit, with the exception that the apparatus is arranged for one-step amplification. This set will meet conditions perfectly, it is claimed, where the intensity of the normal signals does not

The Manufacture of Vacuum Detectors

By O. B. MOOREHEAD

ALTHO the majority of radio engineers are familiar with the use and operation of vacuum tube detectors, a brief description of their manufacture may be interesting. In the early experimental work on this type of device, we strove to produce a detector which would combine maximum operating efficiency with inexpensive manufacture. The next point considered was the production of desirable conditions, i. e., tubes that possest oscillating characteristics, tubes that were exceptional detectors, and tubes that displayed both qualities, says O. B. Moorehead, in a paper recently presented before the Institute of Radio Engineers. The third consideration was the production of a device easily handled and shipt without disturbing the adjustment of the elements and damaging the filaments.

Tubes and bulbs of various shapes and sizes were tried, using a gaseous medium ranging from one millimeter to 0.025 millimeter of vacuum, many materials being employed as elements. Various exhausts were applied, but it was soon found that the employment of a gaseous medium introduced considerable difficulty in the matter of accurate reproduction of a desired result. Gases at pressures ranging from one millimeter to 0.0013 millimeter were next experimented with.

I found that a tube containing a platinum filament in an atmosphere of hydrogen, at pressures comparable with one millimeter, gave fair results. Tungsten filaments were then tried in higher vacua as well as at the so-called "gaseous medium" pressure. It was immediately noticed that conditions could be duplicated as soon as a vacua above that which allowed a "gaseous medium" to exist, were obtained. Moreover, tungsten was ideal as a filament not only because of its refractory qualities and low volatility but also because it acts as a purifying agent by attacking any traces of residual gases that may remain in the tube and forming compounds which are then volatilized on the walls of the tubes.

As the parts are small and complicated, the glass is worked before the blowpipe, after it has been brought into the form of tubes by the glass works. This tubing is obtained by first blowing a bulb, then fusing an iron rod to a point diametrically opposite the blowpipe and rapidly separating the two points of attachment from each other.

Various grades of glass were experimented with, and a mixture containing a high percentage of lead and a small quantity of silicic acid was found to be the easiest to work and produced a detector of maximum sensitiveness when used in conjunction with the aluminum plate and copper grid. In the selection of the glass to be used, the devitrification of the glass had to be considered, as during exhaustion of the tubes it is necessary to subject them to a temperature near the point of softening and nearly all glasses, when maintained at this temperature for any length of time, have a tendency to separate out into the crystalline state.

There has been considerable discussion regarding the elements in this type of device and I may say that aluminum plates and copper grids were first selected on account of their electro-chemical relation to the tungsten filament. Later, numerous other metals were tried under the same and other conditions of exhaustion and showed widely different operating characteristics.

The selection of metals for the elements is very difficult, as a slight difference in either the copper or aluminum changes the whole system of exhaust. For instance, copper and aluminum purchased from one factory lot will require a certain degree of applied temperature during the evacuation, while another factory lot of the same weight and size will require an entirely different exhaust.

I have eliminated this variation to some extent by subjecting the aluminum plates to a temperature of approximately 600 degrees Fahrenheit (315° C.), immersing them in a saturated solution of cyanide of potassium, and finally rinsing in alcohol. The copper is subjected to heat until it glows, when it combines with the oxygen of the air to form a black, brittle oxid which breaks off in scales and exposes the underlying metal which is of rose red color. It is then placed in a current of moist air and becomes covered with a layer of oxygen compounds, which remains very thin but successfully closes the pores of the metal.

The exhaustion of the tubes is the most important operation because of the fact that the low vacuum of the round bulb, nickel element audion which permits of gas conduction is not used in the tubular "electron relay," wherein all gas phenomena must be eliminated.

To produce the high vacuum necessary, I have found that a Gaede mercury pump capable of producing a vacuum of 0.00001 millimeter, backed by a piston pump, such as the Geryck type, is the most satisfactory method of evacuation.

The manifold to which the tubes to be exhausted are attached and the vacuum line connecting the manifold to the pumps, are preferably made of large diameter tubing. A container filled with pentoxid of phosphorus is connected in the vacuum line between the pump and the manifold. The manifold is contained in an oven heated by gas and arranged so that the tubes during exhaustion may be heated to high temperatures.

"A Great Moment We All Experienced"—Not Many Moons Ago. This Self-explanatory Oscillation the Third, Comes From Over the Bounding Foam Via Wireless Operator H. B. Burney, of H. M. C. S. Stadacona.

The lead glass tubing, used as the container for the elements in the tubular type detector, is obtained from the glass works in lengths of 6 feet (2 m.) with an inside diameter of 0.875 inch (2.2 cm.) and a wall of 0.032 inch (0.7 mm.) thickness. This tube is cut in lengths of about 6 inches (15 cm.) and one end is drawn down to a point. Two stems are made of glass tubing similar to those used in an incandescent lamp, one stem contains the grid and two filament leads, and the other contains the plate connection and one filament lead. After the wire is sealed into these stems, they must be annealed very carefully. The annealing consists in allowing the temperature to drop very slowly, since quickly cooled glass is subject to internal strains which arise in the following manner: In rapid cooling, a low temperature is soon established at the surface and the outermost layer solidifies while the interior tends to contract, thereby exerting a pressure on the outer layer which is directed inwards. This may cause the stem to crack.

After the stems are annealed, the grid is wound to the proper diameter and the filament is clamped onto the two leads. The plate is mounted on the other stem and the two stems are then connected together by means of the filament. Final adjustment of the plate and grid is then made. The spacing between the elements is not very critical in this type of device, but it is best to wind the grid to a large enough diameter so that it will strike the plate rather

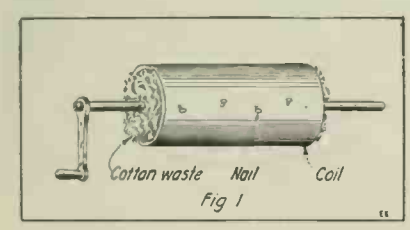
A Vertical Cabinet Type Coupler

By JOSEPH H. KRAUS, Jr.

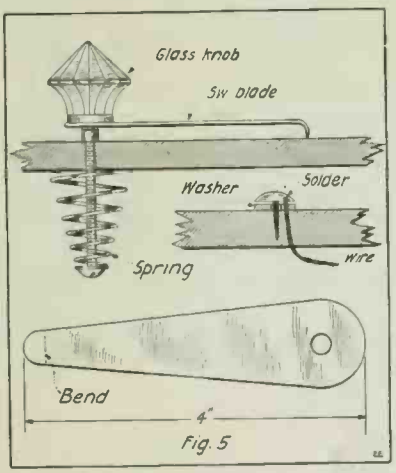
CABINET couplers, altho handsome and efficient, are quite expensive, even if the amateur attempts to make one himself. In the following article is given a description of a large cabinet coupler which did remarkable work and the cost was surprisingly low. An instrument such as this is an asset to any station and will well repay the ambitious Radio Amateur for the time and trouble involved.



Arrangement of Vertical Coupler Secondary, Showing Friction Held Drum on Which Cord Supporting the Secondary Is Wound. The Taps Are of Flexible Stranded Lead and Cabled Together.

THE PRIMARY (WINDING WITHOUT A LATHE)

Two cardboard tubes are first procured, eleven inches long by five and four and one-half inches in diameter, respectively.

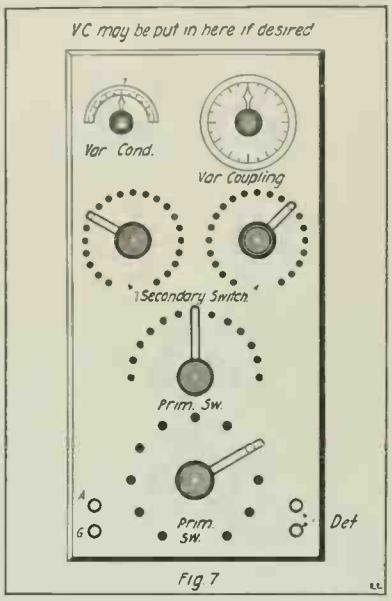


The five inch diameter tube is first wound in the following manner: In the center of a rod of wood about two feet long and of a diameter that will easily pass into both the five and four and one-half inch tubes (a broomstick handle will do) drive several nails, in such a manner that their heads protrude about one-half inch from the wood. This wooden rod is then placed in the five inch primary tube and held as near to the central axis as possible while cotton waste is packed in around the axle. The friction of the cotton waste against the tube will prevent it from slipping when it is being wound and the nails will act as grips for the axle (Fig. 1). A crank is now fastened to one end of the axle and the whole is suspended from two "Y" shaped uprights nailed to the opposite ends of a small box (Fig. 2). By using this cotton-waste method there is no necessity of fitting a rod tightly into the tube and a lathe is not essential. The winding is now commenced three-fourths of an inch from one end of the tube and a tap eight inches long is taken off every turn for the first twenty turns. Number these starting with the first wire as No. 20, then 19, 18, 17 and so on down until we get No. 1, and then No. 0. These taps must not be taken off directly under each other, but they zig-zag or spiral one-third around the tube, so as not to allow the least chance for a *short circuit* between two turns. Each must be carefully insulated and No. 22 black enamel wire used.

The Cardboard Tube on Which the Wire Is to Be Wound Is Mounted on the Crank of the Winding Rig by Stuffing Cotton Waste Inside It.

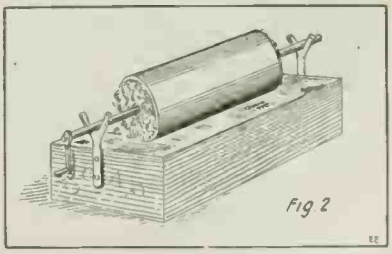
The manner in which a tap is taken off doesn't make much difference and every Amateur has a method of his own. However, here are two "standard" methods. For the primary the preferred method is to solder a wire to the place where the tap is taken off and insulate it carefully. Another method is to twist a loop into the wire and then continue winding; this will constitute a double wire lead (see Fig. 3). (This method will save trouble in the secondary winding.)

After the twentieth tap has been taken off (No. 0) the wire is wound for twenty turns and then a tap taken off. In this way the tube is wound until one-half inch from the other end and one tap taken off every twenty turns. These may be taken off in a perpendicular line, as there is enough winding between each to prevent a short. Number the taps in order from one to fifteen. The wire if carefully wound will result in about thirty-six turns per linear inch, and wound for a little more than 8¾ inches, will net 320 turns, giving twenty taps of one turn each and fifteen taps of the twenty turn variety. Remove from crank and shellac well.



Detail of "Glass" Knob Switches Used On Vertical Coupler Here Described. They Give Very High Insulation Efficiency.

THE SECONDARY

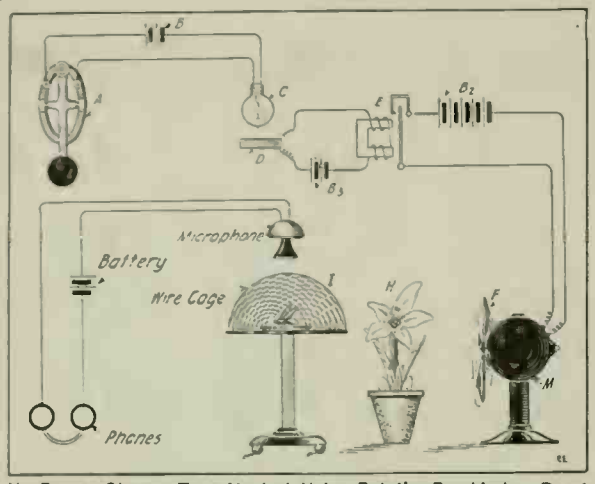


The secondary or four and one-half inch tube is now mounted in the same way and wound with No. 30 enamel wire. Leave a length of eight inches at one end and commence winding one-half inch from the end. A tap of the loop variety (Fig. 3) is taken off every three-quarters of an inch of winding. These loops are made one inch long and are taken off spirally one-third way around the tube. As the winding proceeds and as each tap is taken off a hole is punched into the cardboard tube immediately under each tap and a match stick inserted into the opening; each respective tap is to be drawn thru its particular opening. When complete there should be fifteen taps. Now to each of these is soldered a piece of flexible cotton or silk covered wire about twenty inches long, a piece of rubber tubing slipt over the joint and the wire drawn thru the center of the coil toward one end thru its respective opening. Number each tap in order, shellac and allow to dry.

Note: These wires are not soldered on until the tube has been fully wound and removed from the crank.

(*Continued on page 671*)

Front View of Finished Panel of Vertical Coupler Receiving Set. The Variable Coupler Control Handle Is Placed in the Upper Right Corner of the Panel.



Where No Lathe Is Available for Winding the Coil, Resort May Be Had to a Home-made Winding Rig Like That Shown.

NEW "BUMBLE-BEE" HY-TONE CODE PRACTISE SET!

Here's the hy-tone code teaching outfit you have been looking for, Radiobugs!

No Buzzer Gives a True Musical Note—But the Bumble-bee Does! Hence, Combine the Bee, a Fan to Waft, Periodically, an Aroma of Hyacinth His Way, When We Have a Pure Musical Note Producer. The Microphone Carries His Tuneful Buzzings to Our Ears, Via the Telephone Receivers.

The set works as follows: The sending key (A) closes the circuit thru the battery (B) and lamp (C). The light works the selenium cell (D), operating the relay (E), which closes the circuit of the specially quick-starting and stopping motor (M). A fan (F) on the shaft of this motor plays a breeze on the plant (H), wafting an *Aroma de hyacinth* to the unsuspecting bumble-bee (I), which is tuned to a clear hy-tone. The microphone picks up the bumble-bee's buzzes faithfully and reproduces them in the telephone receivers. Every time you press the key it buzzes. Voila! Contributed by

WM. E. R. MIDDLETON.

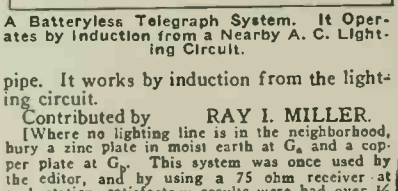
WIRELESS MESSAGES REACH ARCADIA, CAL., FROM BROOKLYN YARD.

The wireless station at Arcadia, Cal., by using for an aerial the cable of a balloon, put aloft from the training field, has intercepted messages sent by the Brooklyn Navy Yard wireless station, according to an announcement by the War Department. This balloon cable probably makes the highest aerial in the world.

This announcement was made by the Division of Military Aeronautics, indicating increasing efficiency in both the work of students and the equipment of the War Department's various balloon training fields. The balloon school at Arcadia has 106 miles of wire in use for teaching military communication. For the purpose of demonstration it has a complete system of wiring strung as it would be in the front line trenches on the battlefield. Communication posts and stations for all kinds of messages are used by the students the same as soldiers use them at the front.

A good part of the country southeast and southwest of Arcadia is laid out with lines of communication to this balloon school, similar to part of a sector at the front. All of the balloons, when aloft, are so wired that they can be lined together with any trench, doubled up for any work together, or they can be cut off from the trenches and talk only with their own chart room and winch or operating crew on the ground below.

It is reported that the U. S. Government purchased the Sayville, L. I., Radio Station shortly after the declaration of war.



SPAIN TO AMERICA BY AIR IS PROJECT IN MADRID.

Captain Herrera, chief of the Spanish military air forces, has had a number of interviews with King Alfonso on the subject of an aerial postal and passenger service between Spain and the United States. The scheme also has been discust at Cabinet meetings and it is said that a leading shipping company is willing to finance it.

The plan, it is understood, is to manufacture large airships capable of carrying forty pasengers, besides the mails. The rate charged for a passenger, if the scheme is carried out will be $400, and letters will be charged for at the rate of $1 per hundred grams weight (about three ounces and a half). It is estimated the journey would take two and a half days.

A BATTERY-LESS TELEGRAPH.

A simple telegraph set may be put up between two chums' houses by running a small wire from house to house about 20 feet above the ground and 50 feet from the lighting wires in the street; connecting a key and receiver as shown in the following diagram. No batteries will be needed. One wire is grounded to the gas or water

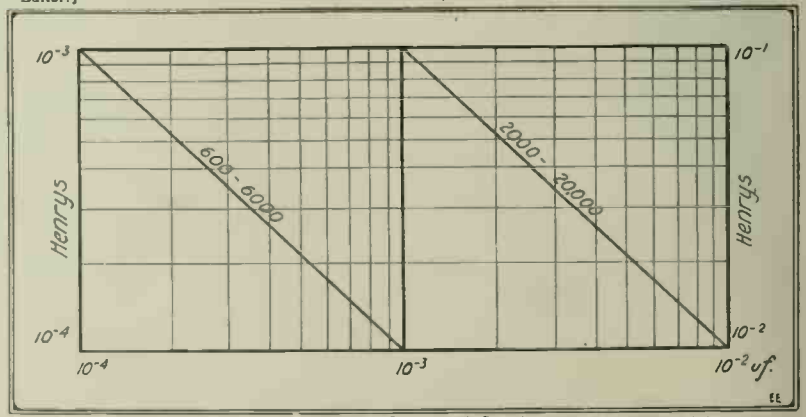
A Batteryless Telegraph System. It Operates by Induction from a Nearby A. C. Lighting Circuit.

pipe. It works by induction from the lighting circuit.

Contributed by RAY I. MILLER.

[Where no lighting line is in the neighborhood, bury a zinc plate in moist earth at G_a and a copper plate at G_b. This system was once used by the editor, and by using a 75 ohm receiver at each station, satisfactory results were had over ½ mile. This "ground battery" gives about .07 volts. —Editor.]

ANENT THAT RADIO COMPUTATION GRAPH.



By K. N. Cummings, Asst. Engineer, Marconi W. T. Co., of Canada.

WITH regard to the article in your September issue, *"A Graph for Solving Wave Length, Frequency, Inductance and Capacity,"* I would like to point out that all the commercial values of the quantities can be represented by use of the two squares of the published diagram bounded by the lines representing one milli-henry, 0.1 milli-henry, 10^{-4} uf. and 10^{-3} uf. (uf. = microfarad.) To do this two inductance scales are required as in the diagram herewith.

Each diagonal line represents two wave lengths, one being ten times the other, as shown for 600-6,000 and 2,000-20,000 meters; giving directly a range of 600 to 20,000 meters, the left-hand inductance scale being used for the lower range of wave length, the right-hand for the upper range.

Only a part of the commercial waves below 600 m. are obtainable directly, but values not on the chart can easily be obtained as follows: To find, say, the inductance required for 300 m. with 0.003 uf., note that the 0.003 uf. line intersects the 3,000 m. line at 0.00084 h. Divided by 100 we obtain 0.0000084 h., the required value. In general, using the line representing 10 times the wave length, divide the value indicated by the graph by 100 and vice versa. Values of inductance and capacity not shown directly may be used as follows: Suppose we wish to find the inductance required with a wave of 8,000 m. and capacity of 1.7 uf., which are approximate values of the Glace Bay transmitter primary; divide the capacity by 1,000. The line for 1.7×10^{-3} intersects the 8,000 m. line at about 1.06×10^{-3} h. Dividing by the same number by which we divided the capacity (1,000) we obtain 1.06×10^{-6} h., the required value. The procedure would be exactly similar with a known inductance and wave length.

By extension of the above procedure, which is simply based on the fact that wave length varies as the square of the capacity or of the inductance, as the case may be, and that the product of capacity and inductance is constant for any particular wave length, we can obtain any wave length, inductance and capacity, but if many values are required which are not on the chart, it would be better to construct another pair of squares of the original graph from which the values could be read directly. The advantage of this graph over the original one is its increased scale, which is ten times that of the original for the same size paper. It is also easier to construct, the number of logarithmic lines required being but 3/17 of the number required for the original.

For All Ordinary Radio Calculations This Simplified Graph Fills the Bill as Well as the Larger One Publisht in the September Issue. It Gives the Value of Inductance and Capacity for Wave Lengths from 600 to 20,000 Meters.

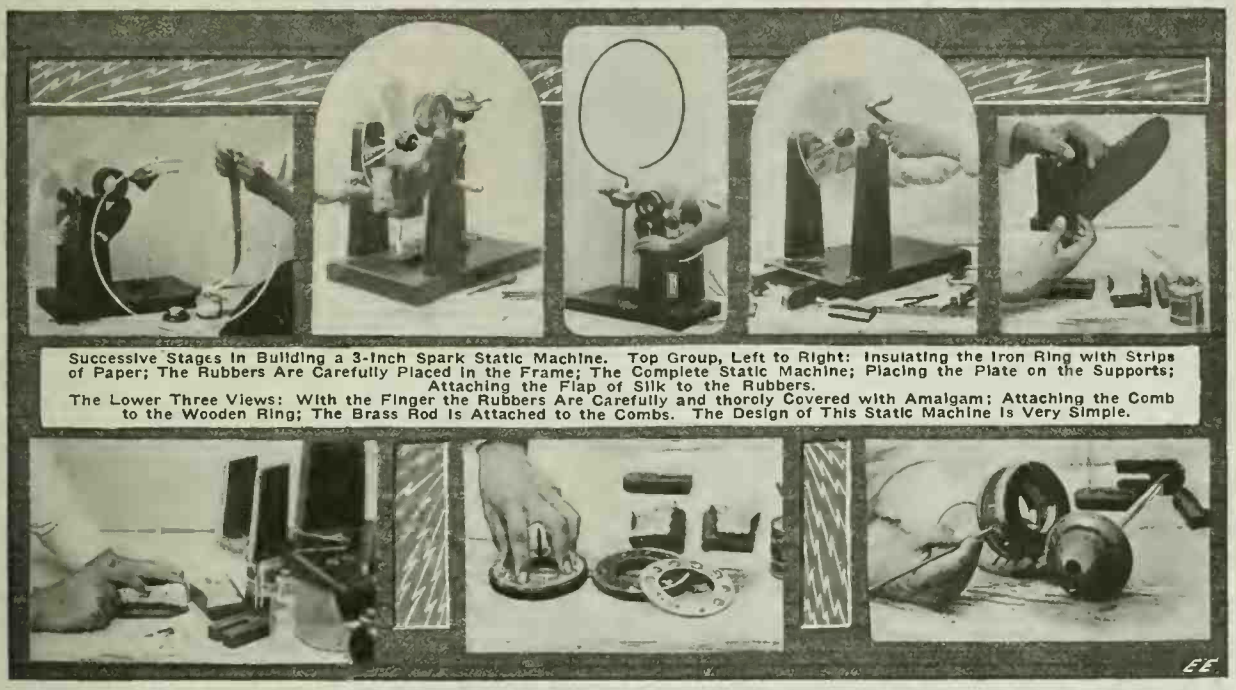
Building a 3-Inch Spark Static Machine



By DR. E. BADE

FRICTION is one of the commonest sources of static electrical excitation. Every one has noticed how the hair crackles under the comb in dry weather. The same sound is heard on stroking the back of a cat, and, if the room is dark, sparks may be drawn from pussy's fur. But for developing large quantities of electricity by friction a static machine is utilized. The simplest form of such a static machine which will develop sufficient electricity for all kinds of devices, as it gives a spark ranging from *one to three inches in length*, according to the neatness and exactness of the finished apparatus, altho one of excellent construction will give a larger spark, consists of a revoluble glass plate, a rubber and a conductor. The capacity of the conductor can be heightened with a well insulated iron ring capable of being attached or taken off from the conductor at will.

The wooden frame is to be made first. It is constructed from hard dry wood (walnut or mahogany); the base is 20 inches long, 12 inches wide, and 2 inches thick; the edges are beveled off. The two supporting arms can be made from thinner wood, but each should be 15 inches long, 4½ inches wide at the bottom, and 3 inches wide at the top. These arms, which are dovetailed to the base, are fastened with two screws countersunk; the holes being later plugged up. But before they are fastened two holes of suitable size for a glass rod which is used as an axle are provided for.

A round glass plate one foot in diameter is procured. This is usually the most expensive part of the machine. It is best to purchase it from a large electrical supply house, so that one does not get a plate unsuited for electrical purposes. A glass rod one foot long and a half to ¾ of an inch in diameter is taken for an axle. Two small wooden rings serve to hold the cemented plate to the rod. One should be careful to see that the axle is perfectly horizontal and the plate exactly perpendicular. One end receives a handle and a wooden ring which prevent it from slipping from the supports.

Now a "*rubber*" is made from three pieces of wood. The lower part is made from a piece 2½ inches wide and 4 inches long. The sides, which are made to slant slightly upward, are 4½ inches high. This frame is supported by a glass rod 4 inches long which is sunk into the wood. The other end is placed in a fork 4 inches long, 2 inches wide, and ½ inch thick. With the aid of this fork the frame is fastened to the base board by winged screws. But before this is done a small brass knob or ball is attached to the frame which in turn is attached, by means of tinfoil, to the rubbers. Each of the two rubbers consist of a board on which soft, thick felt is glued. A spring presses the rubbers lightly against the glass plate. In order to prevent the rubbers from falling out a short piece of wood is nailed to them so that it projects and catches against the frame. Each rubber is now covered with an amalgam consisting of two parts of mercury, one part of tin, and one part of zinc. This must be evenly distributed over the surface with the finger. If this will not adhere a little lard (fat) may be used.

Successive Stages In Building a 3-Inch Spark Static Machine. Top Group, Left to Right: Insulating the Iron Ring with Strips of Paper; The Rubbers Are Carefully Placed In the Frame; The Complete Static Machine; Placing the Plate on the Supports; Attaching the Flap of Silk to the Rubbers.
The Lower Three Views: With the Finger the Rubbers Are Carefully and thoroly Covered with Amalgam; Attaching the Comb to the Wooden Ring; The Brass Rod Is Attached to the Combs. The Design of This Static Machine Is Very Simple.

The conductor with the metal comb is made next. The former consists of a four or five inch hollow brass ball fastened to a glass support. The ball receives two holes thru which a brass rod is placed carrying the comb. The top of the ball also receives a hole which will later carry the ring as well as other pieces of apparatus for experiments. The metal points of the comb are attached to two rings of tin, each of which is fastened to a wooden ring. The metal rings are each 3 inches in diameter. The points consist of ordinary thumb tacks. When the rings are placed between the glass plate, the points should be at least *⅛ of an inch from the glass.* Under no circumstances should they touch the plate.

A flap of silk is glued to the rubber which

How I Built a Model Gyro-Electric Destroyer

By LeROY H. MAHONY

THE illustration represents a 25-inch model of Mr. Gernsback's "Gyro-Electric Destroyer." The entire machine with the exception of the Gyroscope and the driving motors was built of "Meccanno" parts.

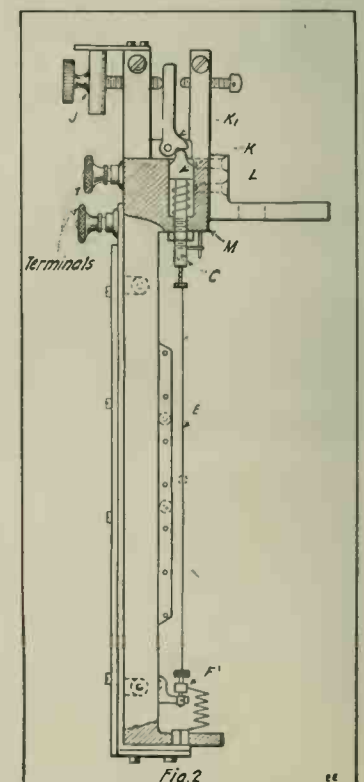
Here Is a Fine Model of the "Gyro-Electric Destroyer." It Is Fitted with Electric Motors and All. It Was Constructed by the Author from "Meccano" parts. It Stands 25 Inches High and Weighs 15 Pounds.

I first constructed each side of the big wheel. To a bush wheel I bolted eight 12½ inch strips equally divided into angles of 45 degrees. I then bolted together seven 12½ inch strips overlapping two holes each. I bent this around the ends of the side braces and fastened it to them by means of angle brackets. In the same way I constructed the other side. I selected pairs of 5½ inch strips and bolted each pair together, overlapping them one hole. Three center treads, the same in circumference as the sides, were then made of seven more 12½ inch strips, overlapping two holes. It now remained to connect the two side and the center tread together by means of the preconstructed pairs of 5½ inch strips. One pair was bolted at right angles to each side brace and one equally placed between them. To preserve more stability, I connected the side braces with 3½ inch strips. This completed the main wheel.

The next part to consider was the engine cage. Three small plates fastened side by side with 3½ inch strips, composes each side, while each end comprises a large plate with the flanged edges flattened out. The sides and ends were fastened together by angle brackets. It is necessary to fasten inside the cage two motors (preferably electric), one to drive the gyroscope separately, and the other to propel the entire machine. As to the position in the cage for these motors—that is left to the discretion of the builder as his type and size of motors may differ from those of the writer. However, the motor driving the gyroscope must be placed in the center as the gyroscope must be driven in the center. The other motor must turn the axle of the wheel by means of chain and sprocket. On each side of the cage is fastened a 3½ inch strip so that the cage is suspended from the center axle.

I next turned my attention to the main axle and the gyroscope. The gyroscope I turned from two pieces of ⅞ inch wood 8 inches in diameter. To the side of it I secured a small sprocket for the driving chain. The gyroscope must run FREE of the main axle. The axle itself is 18 or 20 inches long and must be securely fastened to both sides of the wheel. The axle carries two armored cars (the construction of which I will explain further on), two sprockets, equidistant from the center, and also securely fastened to the main axle, the gyroscope, and the engine cage. A lever action that moves the gyroscope from left to right may be constructed also, at the discretion of the builder, because his material for the gyroscope will again undoubtedly differ. The lever action must be extended down into the engine cage.

The armored cars were lastly put together. For each car, eight large plates, with the flanged edges flattened out, were bent so as to form half a cylinder. Each pair was fastened together, overlapping one hole and making a complete cylinder. Then two of the cylinders were fastened, one on top of the other, with strips bolted to each side and extending over the top so that the car might hang from the main axle. Two inch axles (or better wooden models) were collared to the front and rear of the car to give the appearance of projecting guns. The model was now complete. The builder may elaborate on his model by cross-bracing with string, and so forth. The entire model weighs 15 pounds.



TEAK THE HARDEST OF ALL TIMBERS.

People familiar with different kinds of wood are aware that African teak is the hardest timber known to the mechanical industries. So indestructible is this teak wood that vessels built of it have lasted over one hundred years. The peculiarity of this wood is its hardness and great weight, causing extraordinary durability. Its weight varies from 42 to 52 pounds per cubic foot. It works easily considering its hardness, but the large quantity of silex in the substance require the tools to be extremely hard and even then they are subject to rapid wear. It also contains an oil which prevents nails driven into it from rusting.

EINTHOVEN GALV. STRING.

A commercial form of Einthoven galvanometer string is shown below. The case, E, contains the fine wire carrying the current to be measured. The figure shows schematically the detailed construction of the suspension for the fine wire E, which must be as fine as possible. Platinum, silver or aluminum can be used, but it was found that even a smaller diameter can be obtained by using quartz or glass fibers, these being platinized or silvered. The ends of the wire are soldered to T-shaped members, which are held by the set screws C and F at the ends. Adjusting the tension of the wire is a close operation and it is carried out by mounting the upper wire carrier upon a rod having the cam K at the upper end, the rod being normally pushed up by a spring L. The lever K^1, presses the rod down, this lever being operated by the micrometed screw J. With this arrangement a very fine adjustment of the wire is secured.

A Simple Study of Currents and Magnets

By Prof. E. H. JOHNSON, Dept. Physics, Kenyon College

(Conclusion)

IF now the wires J and K are joined to a direct current circuit of several volts, the wire, H, will rotate about the iron rod, D, which is now a magnet, and it will be found that the *direction of this motion will depend on the direction of the current in the wires.* It may take a little study to see how the action is in accordance with the principles previously defined, but it will be found to be no exception to the rule.

Barlow's Wheel
Fig. 6

Barlow's Wheel—the Simplest Electric Motor for Experimental Studies in Magnetism. The Spoked Metal Wheel Makes and Breaks Contact for the Field Magnet, by Passing Thru a Mercury Well.

Another method of producing motion by the interaction of a magnetic field and a current-bearing conductor is illustrated in Fig. 5. A heavy wire, A, is bent into the form shown with a hook at the upper end, B, from which is suspended loosely a straight wire, C. The lower end of this wire just touches in a pool of mercury, G, which is contained in a small hollow in the supporting base board. A horseshoe electromagnet, M, lies with one pole on each side of the drop of mercury. This magnet may be made from a rod of soft iron 6 inches long and ¼ inch in diameter, bent into the required form, and having its two limbs wound with several layers of insulated copper wire (about No. 20 or No. 24). One end of the wire from the magnet dips into the mercury and the upper end is joined to a binding post, E. When a direct current is past between the posts, F and E, the wire, C, will be moved sidewise so as to leave the mercury contact, and thus break the circuit at that point. Then, since the magnetic field about the wire, C, is gone, it will again swing back into the mercury, completing the circuit. Thus the process will go on much after the manner in which an electric bell continues ringing.

Again, one of the rules should be applied to see why the wire, C, moves just as it does, and how its motion is effected by the direction of the current.

Still another simple device illustrating the same principle is that known as *Barlow's wheel.* See Fig. 6. The electromagnet used in the preceding experiment may also be used here. The wire C (Fig. 5) is replaced by a carefully balanced, rimless wire wheel, W, which is mounted on two wire supports held by the post A. The wheel may be made of light copper wire (say No. 20) with spokes about 3 inches long, and the only difficulty will be to get it accurately balanced. It should have 10 or 12 spokes, which may be soldered to a heavier copper wire for a shaft to be laid across the slightly hooked ends of the supporting wires from the post, A. When the balancing is fair the wheel should turn as easily in one direction as the other, or remain at rest in any position. The mercury pool, with which the ends of the spokes make contact, is connected as before, by a wire to one end of the coils of the magnet, and their other end is joined to the other binding post, B, so that a current may pass thru the apparatus between A and B. In this case the action will be continuous with the proper current, and we have a fair type of *electromagnetic motor.* Again, our *right-hand rule* should be applied, considering the current as flowing up or down, as the case may be, in the spoke touching the mercury, to see if the rotation is what should be expected.

Other experimental devices such as these will readily suggest themselves to the experimenter, and he should learn to look at all such arrangements with that keen appreciation which sees not only the wires and mechanism, but which recognizes at once the *underlying principle* of its operation. When this habit has been formed and some of the information which it will inevitably bring, has been acquired, the entire field of electromagnetism, including dynamo-electric machinery in all of its phases, will open up with a surprising simplicity and consequently with endless interest.

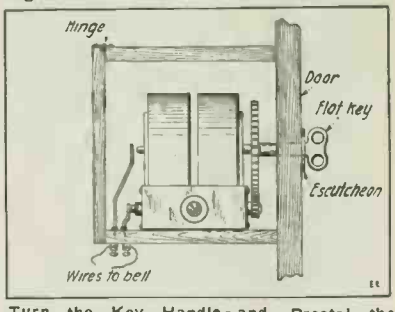
Several Useful Schemes in Igniting Flash-light Powder Electrically.

ELECTRIC FLASH-LIGHT IGNITER.



Having some difficulty when taking flash-light pictures with cartridges, with the fuse not igniting the powder or putting the subject on guard, frequently catching him with his eyes closed, and being badly burnt by the powder once, I constructed the apparatus shown in the accompanying sketch. It will run nicely on four dry cells. The principle is that when the batteries are short-circuited, the wire gets red hot.

The wires leading from the powder box are the kind known as bell or annunciator wire. Inside the box, the wire wound between the tacks is about No. 40 gage. When the box is constructed, place some powder in the box, press the push button, and off goes the powder. To make the apparatus portable, put the batteries in a box, and mount the powder box on top of this. In this way the operator may appear in the picture himself, if the wires are concealed behind furniture and his person. This also catches the subject off his guard, giving him a natural pose; it enables the operator to be at a safe distance from the powder. If a spark coil is procurable, it can be used instead of batteries by running a pin thru each side of the box making a spark gap, connecting up to the coil, and pressing the button. I have used this apparatus extensively and successfully myself.

A "BATTERY-LESS" MAGNETO DOOR BELL.

A small magneto generator is placed in a box (properly stained and finished) on the back of the door. A turn of the knob rings the bell, which may be an ordinary vibrating bell. Best results are obtained by rewinding it to from 100 to 300 ohms. An old crank escutcheon plate from a magneto telephone may be placed on the front of the door. This device when properly made is neat in appearance and does away with all battery troubles.

Turn the Key Handle—and, Presto! the Generator Rings the Bell, Doing Away with Batteries.

Experiments in Radio-Activity

By IVAN CRAWFORD

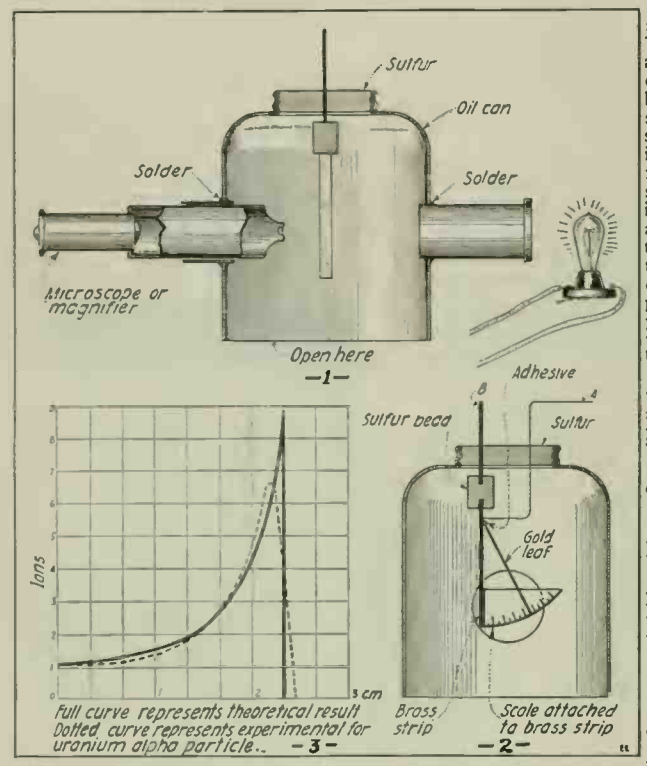
PART 1—Ionization

RADIO-ACTIVITY is one of the greatest mysteries of today. The modern scientists, however, thru extensive experiments have succeeded in throwing considerable light upon the subject. The term radio-active is generally employed in referring to such elements as uranium, thorium, radium and their compounds which possess the property of emitting radiations capable of penetrating many substances opaque to ordinary light. These radiations also have the power of affecting photographic plates, ionizing the gas thru which they pass and causing fluorescence on certain substances placed in their vicinity. It is deemed unnecessary to enter further into the explanation of radio-activity as it has been well described by Mr. Jerome Marcus in previous issues of this magazine. It is the purpose of this series of articles to merely outline some experiments on this extremely interesting subject.

The most important property possest by the radiations of radio-active substances is the power of discharging electrified bodies. The theory has been formulated that this discharge is due to the production of positively and negatively charged carriers by the rays. These carriers, or ions as they have been termed, move with uniform velocity and the rate of production is proportional to the intensity of the radiation. The discharge of an electroscope placed in the vicinity of the radio-active substance furnishes an efficient means of measuring the intensity of the activity.

The construction of a super-sensitive electroscope suitable for making these measurements is clearly depicted in Fig. 1. The metal shell consists of a large oil can with the bottom and spout removed. Two round holes are cut opposite each other about half way up the side. As is clearly shown in the drawing the gold leaf is fastened to a brass strip which in turn is suspended from a sulphur bead. Into the other side of this bead is fastened a wire which passes thru the sulphur block at the top of the chamber. Another wire is then past thru the block and bent as shown. The sulphur block is made by pouring melted sulphur into the opening and allowing it to harden. In order to charge the electroscope the bent wire, A, is turned so that the lower portion makes a contact with the brass strip. A charged rod is then applied to the other end, B, until the desired charge is attained, when the wire may be turned back with the rod. The gold leaf is attached to the brass strip by means of a small drop of some adhesive. In order to observe the discharge, a small low power microscope having a scale on the eyepiece is used. This is mounted in one of the apertures by fastening a brass tube to the shell of sufficient size to allow the microscope to be easily adjusted. A similar brass tube with a ground glass window is mounted in the opposite aperture. This is to facilitate the illumination of the chamber. Using this instrument the rate of discharge may be accurately measured by noting the fall of the gold leaf on the scale. The substance to be measured is placed on a grounded plate and the electroscope placed over it. The radiations by means of their ionizing properties cause the charge of the gold leaf to be dissipated. In Fig. 2 is shown a photograph of such an instrument which was constructed by the author. Some very accurate measurements have been made using this instrument.

To determine the activity of an unknown substance the electroscope should first be charged until the gold leaf coincides with one of the markings on the scale. The time required for the leaf to pass over five divisions on the scale should then be noted with the electroscope empty. The reciprocal of this time is then the measure of the discharging current. The electroscope is then recharged to the same point and placed over the substance to be measured. The time required for the leaf to pass over the same five spaces is again noted. The difference between the reciprocals of these two time elements is then the measure of the discharging current due to the presence of ions produced by the radiations from the substance. Exprest mathematically the discharging current I, which is proportional to the radio-activity is proportional to $I\alpha (1/t'-1/t)$ where t' is the time of discharge in the presence of the substance, and t is the time when empty. Thus by comparing times the radio-activity of equal masses of various substances can be measured. Uranium oxid is taken as a unity and uranium nitrate, thorium nitrate and uranyl chloride were compared with this. The results are shown in the following table:



Substance.	Formula.	Time.	Relative activity.
Empty.....		412 sec.	
Uranium oxide.....	UO_3	26	1.00
Uranium nitrate....	$UO_2(NO_3)_2.6H_2O$	86	.26
Uranyl chloride.....	UCl_4	41	.61
Thorium nitrate.....	$TH(NO_3)_4.12H_2O$	63	.38

It will readily be seen that the activity of a substance is proportional to the amount of uranium or thorium it contains. There are other considerations, however, which affect the experimental results, such as the state of the substance, whether powdered or in lumps. Every electroscope also is different, and all quantitative experiments should be conducted using the same instrument.

It will be found that the distance between the substance and the gold leaf affects the rate of discharge. For uranium compounds the most effective distance is about 3 c.m., while for thorium compounds it is about 5 c.m. Ionization by radio-active rays is by no means uniform along the path of the rays. In Fig. 3 is shown the ionization caused by a sheaf of parallel rays as determined by Geiger. The range is laid out horizontally in c.m., the number of ions are laid out vertically. It will be seen from this graph that when the alpha particle begins to lose some of its enormous speed it becomes a more effective ionizer; near the end of its path, however, its power suddenly decreases.

The experimenter will find innumerable other applications for this electroscope to

(*Continued on page 673*)

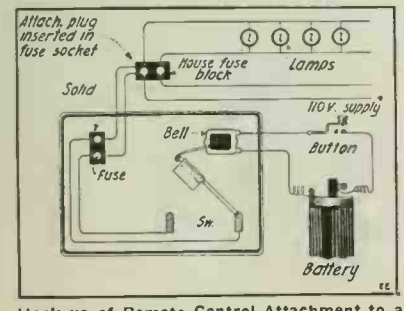
TESTING THE VACUUM GAGE.



The experimenter often wishes to test a vacuum gage. The best way to test such a gage is to compare it with a glass U-tube mercury gage as indicated in the

Testing the Vacuum Gage With a Glass U-tube Mercury Gage. The Latter Is a Common Instrument Used By All Engineers and Can Be Made Very Easily. The Atmospheric Pressure Acts on the Mercury In the Open Tube "A."

sketch. The bent tube ABC, having about 3/8-inch bore, is connected by suitable fittings to the pipe or nipple D, and the latter is connected with an air pump or condenser. The gage to be tested is placed on a tee-connection. The U-tube should be about 36" over all and about half filled with mercury. When there is a partial vacuum made at D, the atmospheric pressure acting on the surface of the mercury in the open tube AB, being greater than the pressure acting on the surface of the mercury in the tube CB, the mercury at the original level EF will fall in AB, as to G, and rise in CB, as to H, and the difference of level between H and G as indicated by the dimension "*l*," measured in inches, will be the *inches of vacuum* which the vacuum gage should indicate. While most manufacturers of vacuum gages are equipt with a U-tube mercury gage, they generally make comparisons with another gage, known to be correct with the U-tube gage. For testing a vacuum gage at a plant not equipt with a mercury gage, the usual practise is to compare the gage to be tested with one considered to be correct.

Hook-up of Remote Control Attachment to a Two-wire Lighting Circuit. The Control Circuit Wires May Be Ordinary Bell Wire as This Is a Battery Circuit Only.

REMOTE CONTROL SWITCH FOR LIGHTING CIRCUITS.

After obtaining the necessary material listed below, remove the handle from the knife switch and substitute a weight made from 2" length of conduit pipe and 5/16" x 2½" stove bolt. The head of stove bolt is filed flat on one side so as to be properly engaged by the trip arm. The bolt is placed in one side of pipe, and pipe filled with melted lead and allowed to cool off. The threaded end of bolt is then inserted thru hole (in insulating bar across knife switch) formerly occupied by screw holding handle. If properly placed this weight does not come in contact with either of the switch blades.

Now place the fuse block in upper left-hand corner of the iron box as shown on sketch, then place knife switch in bottom, the one side of base being against back of iron box and the whole switch so mounted as to allow weight to swing down and close switch without hitting side of box. The rubber bumper is then placed on bottom of box either with small stove-bolt counter-sunk in the rubber or with a small wood screw from the under side.

The object of the bumper is to prevent the weight from snapping off the insulating cross piece of switch when switch drops.

The casting on bell for holding gong should be removed with a hack-saw just beyond the screw hole, and the ball hammer can be cut off with a pair of cutting pliers, leaving the hammer arm intact.

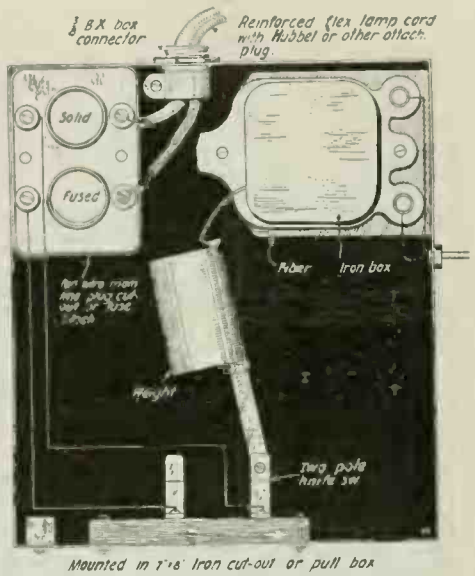
In placing the bell it will probably be necessary to build it out from the back of box so that the trip arm centers over weight on switch. This building out should be done with either a piece of fibre, porcelain or iron washers. No wood or combustible material should be used. Bend trip arm as shown in sketch, so as to engage the filed side of stove-bolt-head which protrudes thru the weight.

All mountings should be made with stove-bolts, drilling holes in iron box where necessary. If box is thick enough to allow threading machine screws may be used.

The rubber bushing to protect bell wires can be inserted in the box at any convenient place and a narrow piece of linen tape or wire twisted tightly around the inside will serve to hold it intact.

Place the attachment plug on one end of the lamp cord, knock out one of the punchings in the iron box and place the B. X. connector, insert the cord thru this and wind the cord with tape on the inner side of the connector so that the clamping device can be tightened thereby holding lamp cord, preventing pull on the connections at fuse block and at the same time serving as a bushing for the cord. Connect other end of cord to fuse block as shown.

Make all connections as shown using the No. 14 wire for the lighting circuit and ordinary bell wire for battery circuit.



Only one blade of the knife switch carries current for the ordinary two-wire lighting circuit. For the three-wire circuit the two blades are used and an additional lamp cord and attachment plug are required.

Installation: This apparatus should be mounted on wall close to house fuse box and not more than 6 or 6½ ft. from floor.

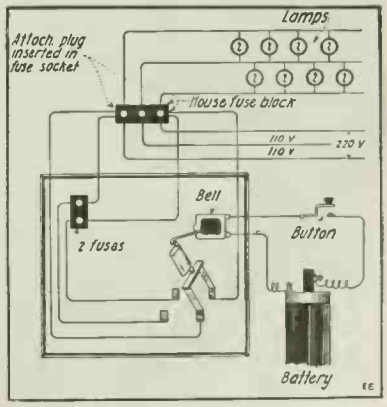
To connect to an installation one fuse is removed from the house fuse box and the attachment plug inserted in its place, the fuse can then be placed in the "fuse" socket of the apparatus. The bell circuit can easily be run and the button and batteries installed at any convenient point.

Operation: By closing battery circuit, the bell magnets become energized, which lifts the hammer or trip arm and disengages the weight, allowing switch to drop and close lighting circuit.

To reset and cut out lights; open door of iron box and lift weight until engaged by

Construction of "Remote Control" Switch Which Can Be Made With a Buzzer or Bell Movement to Trip the Weighted Knife Switch Blade.

hammer arm of bell, then close the door.



Keep pivoted and contact clips of knife switch lubricated with vaseline. This switch can be used for distant cut-in control or in conjunction with burglar or fire alarm systems, cutting in the lights when alarm operates, and doing away with the necessity of running heavy lighting wires.

Where the law requires it, a ground wire can be attached to the iron box with a short stove-bolt, and the box grounded to the electric conduit system.

The following material is required to make this apparatus:

One 7" x 8" iron cut-out or switch box.
One two-wire main line plug fuse cut-out block.
Two dry batteries
One two-pole single-throw knife switch.
One iron box bell.
One push button.
One ½" B. X. box connector.
One rubber lamp socket bushing.
One attachment plug.
One 3/16" x 2½" stove bolt.
One rubber knob from old door bumper.
One 2-inch length of 1" conduit pipe.
Two ft. No. 14 B. S. gage double-braided wire.
Two ft. reinforced flexible lamp cord.
Proper quantity of bell wire.

Experimental Mechanics

By SAMUEL D. COHEN

LESSON IX

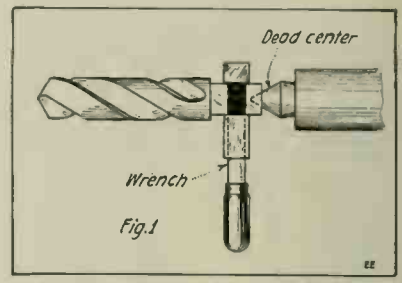
Boring and Drilling.

THAT the lathe can be used with success for drilling purposes is mentioned in one of the earlier lessons of this course. The subject will be further considered in the present lesson, and several useful kinks regarding drilling in the lathe will be given. Whenever it is desired to make a hole of general size in some material, it is usually done by the use of a drill of the desired diameter, said hole being made in one operation. There is still another method of making a hole, and that is by *boring*. It can be done by a single pointed tool cutting into the material in successive cuts, which gradually enlarges the opening until the desired diameter is obtained.

Boring Out a Casting in the Lathe by Means of a Boring Bar "BR." The Casting Is Secured by Bolts "B" to the Saddle "CS."

Practically all small holes are always drilled, while large ones are bored. In order to drill a large hole it requires considerable driving power, also the removal of a considerable amount of metal. However, if the method of boring is utilized, a rough hole may be *cored* thru the casting when the latter is made in the foundry, and this can be enlarged later by the use of the boring tool. If the work is not made of cast material, it will be necessary to drill a hole large enough to permit the boring tool to make its first cut.

In drilling small holes, say up to one inch in diameter, it will be found that twist drills give most favorable results, as they are dependable for producing an accurate and straight hole. It is usual, in practise, to fasten the drill in a self-centering chuck, as explained previously, and to feed the work up against the drill by means of the mandrel of the tail stock in the lathe. The first step before attempting to drill is to accurately mark the spot where the hole is desired, making a heavy center-prod or mark, so as to guide the point of the drill at the start. To drill large holes, a circle the size of the hole should be marked with a pair of compasses, first chalking the surface, and four center impressions should be made at opposite points on the line. These are necessary to act as guides should the line get effaced. A start is then made, but before the point of the drill has fully entered the metal an examination should be made to see that it is cutting truly within the circle marked out. If so, the work may be proceeded with.



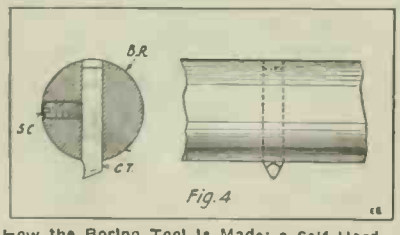
Should the drill by chance happen to cut slightly to one side, the fault can be remedied by cutting a narrow groove at one side of the hole. This may be done with a narrow-pointed diamond chisel. The groove should be made at the side toward which the hole requires to be corrected. Here the drill may again be applied, the effect of the newly made groove being to draw the drill toward the center of the circle. The drill should then be turned several times and the hole again examined. If necessary, the drawing process can again be repeated until the hole is exactly central. The reader, of courst, fully understands that this drawing process should be done before the full diameter of the drill commences to cut, as the grooving plan can have no further effect in drawing over the hole, after the full diameter of the drill enters the hole.

At certain times it happens that the relative positions of the parts are reversed. Thus the work to be drilled is held in the chuck, the drill being fed up to the work. Many times it proves convenient to first drill a small hole, then a larger size, and lastly use the full size drill.

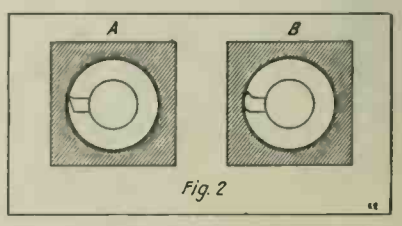
If the work is held in the *live* chuck, the drill should be fed by means of the tail-stock center, and held firmly thereto. The drill can be held either in a drill chuck fitted with a mandrel for the dead center spindle, as shown in Fig. 10, Lesson 6, or by setting the center hole of the drill onto the dead center, its shank being held with a wrench in order to prevent it from turning, see Fig. 1. When the hole is made in this manner it is necessary to start the drill centrally. An accurate starting point is obtained by the use of the cutting tool placed in the slide rest. This method will insure a proper drilling point.

Boring is chiefly used when it is desired to make a large hole. However, at times it is simpler and easier to bore a small hole of proper diameter and accuracy than it is to drill it. But care must be exercised to see that there is a proper clearance at the lower part of the cutting tool, as indicated in A, Fig. 2. If the tool is improperly set so that the lower part scrapes against the side of the work, as shown in B, Fig. 2, its proper functioning will then be interfered with. The tool will not only be prevented from cutting into the metal, but due to the rubbing action against the metal, it will be heated and caused to lose its temper, thus destroying the cutting qualities of the tool, besides making an inaccurate hole.

It is advisable to make the first cut a fairly heavy one, in order that the hole may be cleaned up perfectly true around its circumference. Thercafter several lighter cuts may be made, until the diameter is brought to the proper size. The *inside caliper* should be used in this work to ascertain the diameter. Precaution should be taken to set the slide-rest perfectly true so as to insure a parallel hole being bored. If the diameter is found to alter, (should it taper, for example), the slide rest can be changed accordingly. By the use of a self-acting feed on the slide rest, the hole should be perfectly parallel, provided the head stock and lathe bed are set true, the position of the slide rest not at all affecting the work in this case.



Holding a Twist Drill in the Lathe by Means of a Monkey Wrench. The Back of the Drill Is Placed on the Tail-stock Center.



If it is desired to bore certain work which is too large to be chucked on the face-plate or chuck of the *live* spindle, it is practical to secure the work to the saddle of the lathe, as shown in Fig. 3. This is done by supporting the boring rod between the live and dead centers, the boring rod carrying the cutting tool. Engine and pump cylinders, field magnets for dynamos and motors, also bearings of engine bed plates are examples of work which can be done in this manner. It is essential to have a lathe with a saddle, actuated by a self-acting feed motion, unless a complicated boring bar fitted with its own screw feed motion is used. Fig. 3 shows a cylinder W of an engine, which is secured to the lathe saddle, C. S. This is done by clamping the cylinder with two bars, each having two holes, the distance between which should be greater than the diameter of the work to be secured. The bars, R, R, are laid across the top of the work and clamped down by means of two bolts, B. These heads fit into the slides of the lathe saddle. The cutting tool, C. T., is held on the boring rod, B. R. It is revolved by the *live* center while the cylinder is slowly carried along the lathe bed toward the live headstock by the self-acting feed motion applied to the saddle.

Before attempting to bore into the work, it is advisable to see that the work is firmly

Experimental Chemistry

By ALBERT W. WILSDON

Thirty-second Lesson

PHOSPHOROUS: History.

PHOSPHOROUS was discovered by Brandt, an alchemist, in 1669 at Hamburg. He gave it the name *Phosphor* [light bearer]. Gahn, in 1769, found it to be a constituent of boneash, and about 1775 Scheele first publisht his method

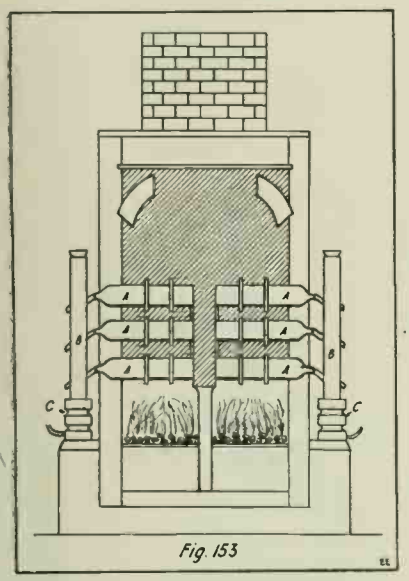

Fig. 153

In the Preparation of Phosphorous Great Care is Taken Not to Have the Hot Phosphorous in Contact with the Air, and the Retorts Are Arranged so That the Phosphorous Runs Into Cold Water.

of preparation from this source. Liebig in 1840 used phosfates as a fertilizer for plants, while Romer [about 1833] first applied it to matches, thus revolutionizing the means of obtaining fire and light.

Occurrence.

It never is found in the free state, but chiefly as calcium phosfate [$Ca_3[PO_4]_2$], the principal constituent of bones. This occurs in certain minerals as *Apatit* [$3Ca_3[PO_4]_2$] and *Phosforite* [$Ca_3[PO_4]_2$]. The latter being also known as *Phosfate Rock*, being extensively used for fertilizing purposes.

Phosphorous is always found in plant and animal tissues, in the soil, and in sea water.

Preparation and Manufacture.

It is obtained mainly from bones of vertebrate animals, which usually contain from 55 to 60% of calcium phosfate, the hard parts of invertebrates being mostly Calcium Carbonat, $CaCO_3$. These bones are first burned or else distilled. In either case the ash is the same, but in the latter the carbon is retained as boneblack, which in the former gives rise to carbon dioxid. The volatile substances driven off are ammonia and other nitrogeneous products, such as water, carbon dioxid, etc. The ash, mostly Calcium Phosfate with a little calcium carbonat, is reduced and phosphorous obtained by three steps.

First.—It is treated with Sulfuric Acid, which changes it to a soluble phosfate $H_4Ca[PO_4]_2$.

$$Ca_3[PO_4]_2 + 2H_2SO_4 = H_4Ca[PO_4]_2 + 2CaSO_4$$

It might be expected that the Sulfuric Acid would change the phosfate salt into phosforic acid, but the Sulfuric acid used is not very strong and the reaction goes but halfway, producing an acid salt. It, however, changes the insoluble phosfate to a soluble one and precipitates the Calcium Sulfate, which is then separated by filtration or settling.

Second.—The liquid is next evaporated, and the solid residue from the evaporation is strongly heated, a process which breaks it up into Calcium Metaphosfate [$Ca[PO_3]_2$].

$$H_4Ca[PO_4]_2 = Ca[PO_3]_2 + 2H_2O$$

Third.—The reducing agent, carbon, is next added and thoroly mixed, and heat is again applied. When two-thirds of the Phosphorous distills over, the remainder again forms Calcium Phosfate.

$$3Ca[PO_3]_2 + 10C = Ca_3[PO_4]_2 + 10CO + 4P$$

To obtain the whole of the Phosphorous, Silica [SiO_2] in the form of sand is introduced, and the following reaction takes place:

$$2Ca[PO_3]_2 + 2SiO_2 + 10C = 2CaSiO_3 + 10CO + 4P$$

Great care is taken not to have the hot Phosphorous in contact with air, and retorts are arranged so that the Phosphorous runs into cold water. See Fig. 153. The Phosphorous must be either redistilled or prest thru chamois skin to get rid of carbon particles, etc. It is then run into small moulds of copper or glass.

The manufacturing process is detrimental to the health of the workmen. Some of the fumes have to be inhaled, and the breath at night is often luminous. The element attacks the teeth and jawbones, especially the lower jaw, which is sometimes entirely eaten away thru failure to cleanse the teeth.

The electrical process has practically replaced the old method. In an upright pear-shaped furnace, an intimate mixture of Carbon, phosfate, and flux is heated by means of carbon electrodes in the electric furnace, as shown in Fig. 154. The mixture is fed in thru the hopper H, the carbon electrodes entering at GG. The phosphorous vapors pass off above to a condenser, being condensed under water, while the slag is tapt off below at C.

$$2Ca[PO_3]_2 + 2SiO_2 + 10C = 2CaSiO_3 + 10CO + 4P$$

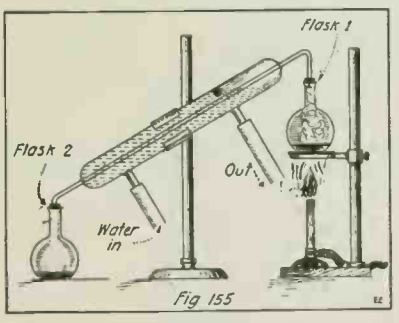

Fig. 155

An Interesting Experiment in Which the Phosphorous from Match-heads Is Extracted by Means of Distillation.

Physical Properties.

1. It is found in several *allotropic* forms, the most important being the yellow and the red varieties.

2. *Yellow phosphorous* is a colorless, transparent to translucent, wax-like solid. At ordinary temperatures it is sufficiently soft to be cut with a knife, but at lower temperatures it becomes more brittle.

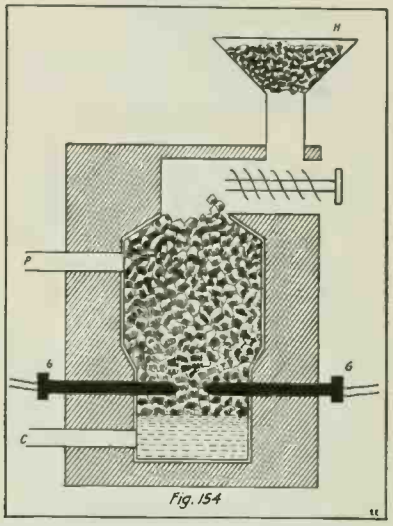

Fig. 154

Preparation of Phosphorous in the Electric Furnace. A Mixture of Carbon, Phosfate and Flux Is Heated by the Passage of the Electric Current. Electrodes at G-G. The Phosphorous Vapors Pass Off Above to a Condenser, Being Condensed Under Water, While the Slag Is Tapt Off Below at C.

3. It burns the flesh when handled out of water, and these burns are slow to heal, on account of the poison absorbed. For this reason this element should always be manipulated with a pair of forceps.

4. It is insoluble in water. It is soluble in 350 parts of absolute alcohol at 15° C, and in 240 parts of boiling absolute alcohol. It is soluble in 85 parts of absolute ether, in 25 parts chloroform, and in about 50 parts of any fatty oil. Carbon-disulfid is probably its best solvent, dissolving from 18 to 20 times its weight without losing its fluidity. All solutions of phosphorous in carbon disulfid should be preserved with the greatest care. When spilled or otherwise exposed, the solvent rapidly evaporates, leaving the phosphorous in such a finely divided condition that *it inflames spontaneously*.

5. It possesses a garlic odor, and is very poisonous. This odor somewhat resembles *Ozone*.

6. The phosphorescence, visible in the dark, when exposed to the air appears to be due to the slow formation and spontaneous combustion of phosphin.

7. Phosphorous is a very inflammable element, igniting spontaneously in air at 50° C. For this reason it is kept and cut under water. Phosphorous, when kept under water and exposed to the light, undergoes slow oxidation, becoming covered first with a white, opaque film, which slowly turns red.

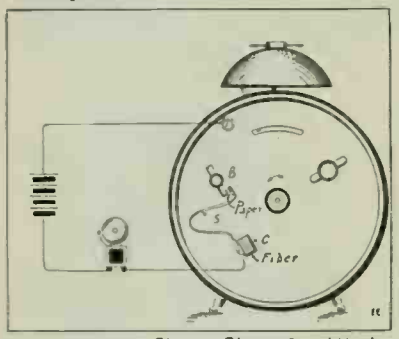
www.americanradiohistory.com



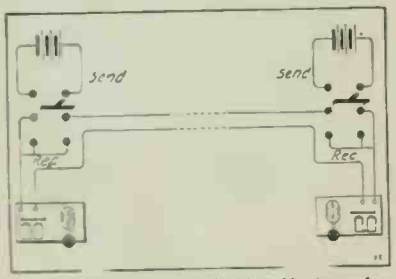
This department will award the following monthly prizes: First Prize, $3.00; Second Prize, $2.00; Third Prize, $1.00.
The purpose of this department is to stimulate experimenters towards accomplishing new things with old apparatus or old material, and for the most useful, practical and original idea submitted to the Editors of this department, a monthly series of prizes will be awarded. For the best idea submitted a prize of $3.00 is awarded; for the second best idea a $2.00 prize, and for the third best prize of $1.00. The article need not be very elaborate, and rough sketches are sufficient. We will make the mechanical drawings. Use only one side of sheet. Make sketches on separate sheets.

FIRST PRIZE, $3.00

SIMPLE ELECTRICAL ALARM CLOCK.

Herewith are submitted the details for an electrical alarm clock which I believe is the simplest one I have seen publisht in

An Easily Made Circuit Closer for Attachment to Any Alarm Clock. The Bell Will Ring Until Shut Off.



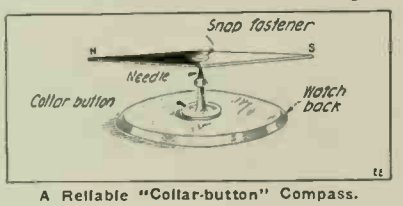
your valuable magazine. A brass spring (s) is supported on an insulating block (c). A piece of blotting paper is glued on to the end of the strip to insulate it from the alarm-winder. The operation of the alarm can be easily understood. When the clock alarm rings, winder key revolves which releases the spring. When the spring is released it strikes against the side of the clock, thus closing the circuit.

Contributed by CHAS. WALLER.

UNIQUE "HOOK-UP" FOR TELEGRAPH SETS.

Herewith is a hook-up used by myself and friend on our telegraph sets, the main object being to eliminate closed circuit cells and to use dry cells. When one fellow wishes to call the other he opens his key and throws his switch over to "send." When receiving, he throws switch over to "receive" and closes his key. The apparatus used comprises two sets, *i. e.*, sounders and keys; two D. P. D. T. switches, 2 sets dry cells (3 each). Our system works fine and the extra-switch throwing is worth the battery saving.

Contributed by G. E. MEARS.



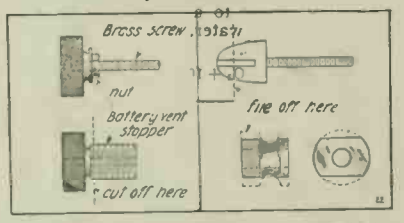
Simple and Effective Switching Hook-up for Two-Way Telegraph System.

SECOND PRIZE. $2.00

A "COLLAR BUTTON" COMPASS.

This compass is very easy to construct, and can be made with a needle, collar button, snap fastener, and a piece of thin steel, cut in the shape of a compass needle. After having cut the needle to the desired shape and size, punch a hole in the center. Over this solder the bottom part of a snap fastener. This completes the needle. Next, force a steel needle up thru the collar button so that it protrudes out of the top about one-sixteenth of an inch. Solder it firmly from the under side. The needle is magnetized by rubbing it over a magnet. When it is thoroly magnetized, place it on the needle point and adjust it so that it will balance and revolve freely. It can be mounted either in or out of a case as desired. I find that an old dollar watch *back* makes a good

A Reliable "Collar-button" Compass.



base as it does not affect the needle. This compass is very handy for performing experiments.

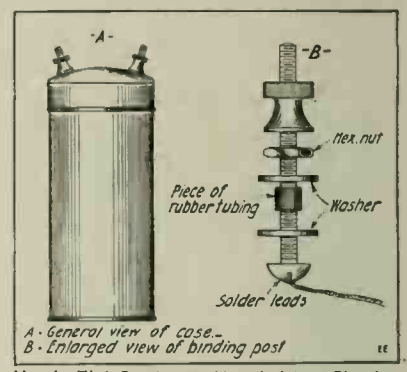
Contributed by J. H. ENGLAND.

KNOBS FOR ROTARY SWITCHES.

Knobs for rotary switches may be easily made from the vent stoppers on old storage batteries. This is done by cutting the part off which has threads on it and drilling a hole large enough to put a brass bolt thru, as shown in sketch. (Vent stoppers may be purchased from garages). See cut below.

Contributed by MARION HENSEL.

Left:—Old Storage Cell Vent Stoppers Make Good Switch Knobs. Right:—Discarded Dry Cell Terminals Used as Switch Points.



The negative binding posts on dry cells make good contact points for rotary switches when filed down as shown above. Remove them with the pliers while the nuts are still on. Take one of these nuts and file to opposite sides flat; see sketch. Then screw the screw post in it, placing both in a vise. Then the head can easily be filed down without injuring the threads.

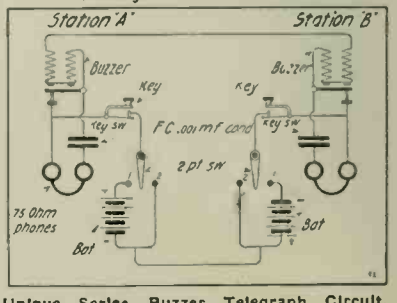
Contributed by P. B. KINGSLEY.

THIRD PRIZE, $1.00

FIXT CONDENSER IN A SHAVING STICK TUBE.

An efficient and neat fixt condenser can be made from a nickel-plated shaving stick

Handy Fixt Condenser Mounted in a Shaving Stick Tube. It Can Be Embedded in Paraffin Wax.



can as a container. First cut some tinfoil to about 2 foot lengths and 1-3/4 inches wide, separated by 2-1/4 inch width paraffined paper. This can be made as large as desired, and by heavy pressure a large condenser can be placed in the tube. Solder all lugs and make connections with flexible conductor to binding posts. Bore holes in the cover and make washers as in (B). Fill the case with molten paraffin wax.

Contributed by E. S. HAGEMANN.

A SERIES BUZZER TELEGRAPH SET.

Here is an efficient series buzzer telegraph system. When the set is not in use put switches on No. 2, then when you wish to call up your friend put your switch on No. 1, disconnect the key switch and start sending. As soon as your friend hears your signal, he puts his switch on No. 1, thus increasing the battery strength. Remember to reverse the batteries; *i. e.*, if it is *positive* at your switch on one end, make it *negative* at the other station.

AN ELECTRIC FIRE DETECTOR.

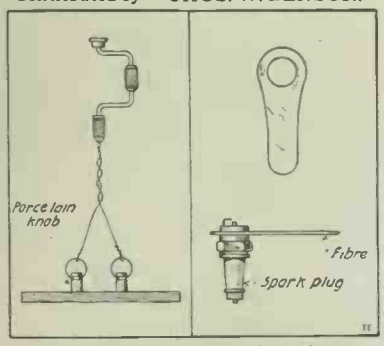
Herewith is a plan of a fire detector which I made myself. It consists of two batteries, a cigar box, an electric bell, a

In Case of Fire the Heat Expands the Copper Wire Spiral, Causing It to Touch the Lower Contact Block, Thus Ringing the Bell.

piece of bare copper wire made into a spiral spring, two blocks of wood, four screws, and two binding posts. Normally the wire made into a spring does not touch the lower contact block, but when fire breaks out it expands the wire spiral and completes the contact, causing the bell to ring.

Contributed by JOSEPH WOHLPART.

SPARK PLUG TESTER MADE FROM SPARE PLUG.



Most autoists carry a spare spark plug in their tool chests which can be made to serve as a spark plug tester without destroying its usefulness.

The only thing necessary is to cut a piece of fiber or heavy cardboard to the shape shown in the illustration. The hole in the end is made large enough to pass the threaded end of the plug and serves as a holder.

To test the plug in the engine, hold the spare plug, sparking points up, by means of the fiber strip. Touch the post on the plug to the engine cylinder and bring the thread end of the plug in the strip against the binding posts of the plug in the engine.

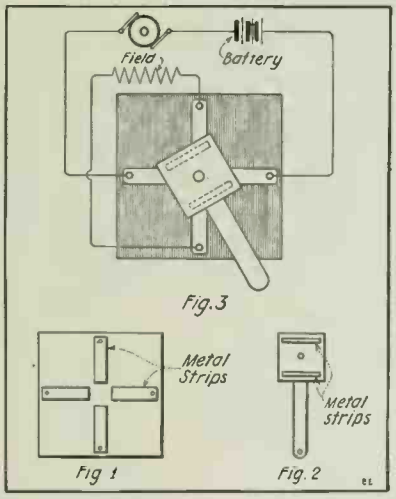
A small spark or none at all will indicate a broken porcelain or carboned and short circuited plug. A heavy spark will show that the points of the plug in the engine are too far apart. In cases of emergency any means may be employed that will hold the test plug without giving the driver a shock.

Contributed by THOS. W. BENSON.

At Left—Twisting Cables With a Bit Brace. At Right—Using the Spare Spark Plug as a "Test" Plug for the Auto Engine.

TWISTING CABLES IN THE SHOP.

In looking over your October, 1916, issue under the head of "How-to-make-it," I noticed a scheme for twisting telephone wires, contributed by Mr. Leach. While this is a good method, I would like to suggest one that will not ruffle or twist the insulation of the individual wires as other methods do.



Porcelain knobs may be used as swivels. Attach two knobs to shop wall, do not tighten up screws, knobs should turn freely. Attach No. 14 wire loops to receive ends of insulated wires. Have wires same length; turn brace five or six times, pulling on it to take up slack and keep knobs from turning. Now slack off slightly on brace and knobs will spin, thus relieving the twist in each individual wire. Almost any length of wire can be handled in this manner, equalling the factory product.

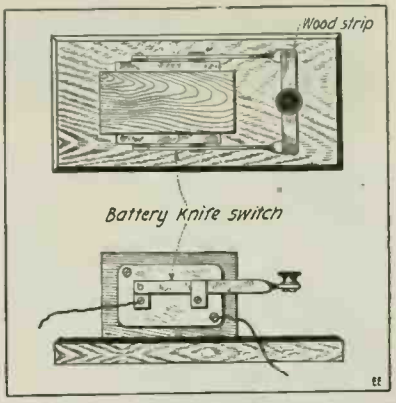
Contributed by J. ESHLIMAN.

A REVERSING SWITCH FOR SMALL MOTORS AND TOYS.

A small but thoroly effective reversing switch for small battery motors and other apparatus can be made from scraps found about most any workshop.

First procure a fiber base about 1½" square and ⅛" thick. Next cut four strips, each ½" long and ¼" wide out of a piece of brass about 1/16" thick. Then bore a hole in one end of each strip and fasten it to the base by means of small wood-screws as shown in Fig. 1.

A Handy Reversing Switch for Battery Motors, Toy Railway Cars, Locomotives, Etc. Throw It to Either Side to Reverse the Motor.



Then take another piece of fiber about ¾" square and ⅛" thick and fasten two metal strips to it as shown in Fig. 2. A handle may then be made and soldered to one of the strips. (In constructing this reverser, be sure and do not short-circuit any of the strips because it will not work.)

A hole should then be bored exactly in the center of the small piece of fiber and fastened to the main base by means of a wood or machine screw. The complete reverser and connections are shown in Fig. 3. If desired a metal base and body can be made to enclose the working parts. If so constructed a slot should be cut in the body for the extending handle so the switch can be easily operated.

Contributed by WALTER SELLENEIT.

HOW TO MAKE A S.T.D.P. SWITCH OUT OF TWO S.P. KNIFE SWITCHES.

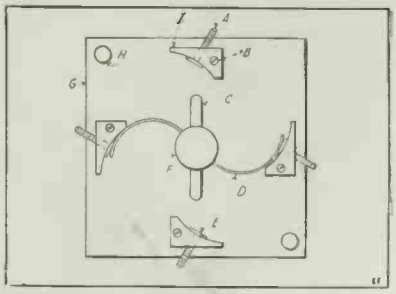
Nail a block of wood on to a base of proper size. Next procure two S. P. battery knife switches. It must be made certain that one opens to the right and the other to the left. The reason for this can be seen when they are mounted. If they are the same, just take off the knife and terminals and remount them in reverse or-

An Effective Double-Pole Single-Throw Knife Switch Constructed from Two S. P. S. T. Knife Switches.

der. Then get a thin strip of wood or fiber to fit across the ends of the knives. This can be fastened on with small stove-bolts. In the center of the strip bolt a small porcelain knob.

Contributed by HENRY RHEIMS.

DRAFTING HINTS.



Tracings may be very readily cleaned and pencil marks removed by the use of benzine, applied with a cotton swab. It may be rubbed freely over the surface without fear of injury to the lines drawn in ink, or even water colors, but pencil marks and dirt will quickly disappear. The benzine evaporates almost immediately, leaving the tracing unharmed. The surface, however, will be somewhat softened, and should be rubbed down with a little powdered talc or chalk before drawing more ink lines.

Always sprinkle chalk or talc on surface (dull side) of cloth, rub in with fingers, and wipe off before starting to draw ink lines.

SIMPLE HOME-MADE SNAP SWITCH.

This is a very durable but simply constructed snap switch. (A) is the screw from an old dry cell carbon, the head (E) being filed flat and inserted in a small block of wood (I) drilled as shown. The block (I) is fastened to wood base (G) with screw (B). A strip of spring bronze (D) inserted thru the slot in spindle (F) assures an excellent contact. (C) is a pin for handle and (H) the supporting screw holes.

The spindle is held in the base by a small rivet at the bottom. This can be

Here's a Way to Make Home-Made Snap Switches. It Works Very Well, Too.

used either as a single or double-pole switch.

Contributed by HENRY O. WUELFING.

www.americanradiohistory.com

SPIRIT LAMP FROM FAN GREASE-CUP.

A novel but efficient spirit lamp can be made from a fan grease-cup when cleaned and filled with alcohol and a wick inserted.

Simply Fill a Fan Grease Cup with Wood Alcohol, Insert a Wick in the Hole, and You Have a Serviceable Little Spirit Lamp for Light Soldering

It will burn for one hour. This lamp can be used for numerous purposes, such as removing enamel from enameled wires, et cetera. A small brass tube can be easily soldered to the cup for the purpose of providing a blast of air and a side-wise concentrated flame tip, by blowing thru the tube. The upper end of the tube must be closed, and a tiny hole drilled in it—about No. 64 drill.

Contributed by EDWIN WOLBER.

SOME INTERESTING CHEMICAL EXPERIMENTS.

When a very little dry powdered potassium permanganat is moistened with sulfuric acid, brownish-green oily drops of permanganic anhydrid (Mn_2O_7) are formed. This compound is volatile, giving a violet vapor and is apt to decompose explosively into oxygen and manganese dioxid. Its oxidizing power is such that combustibles like paper, ether and illuminating gas are set on fire by contact with it.

White phosphorous, when heated with sulfur unites with explosive violence. By using red phosphorous the action can be controlled. The product is phosphorous sulfid and the kind depends upon the proportions used.

If a small piece of sodium is placed on a piece of filter paper and placed on water, the water is decomposed and the heat liberated is sufficient to set fire to the sodium, which burns with a characteristic yellow flame.

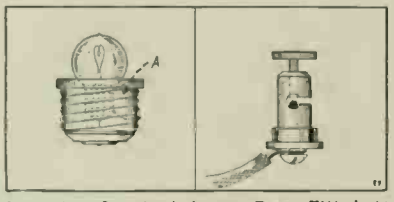
Powdered magnesium and potassium chlorat in the proportions of 10:17 is used in making flashlights for use in photography.

Cordite, a variety of smokless powder, is made by dissolving guncotton (65 parts) nitro-glycerin (30 parts) and vaseline (5 parts) in acetone. The resulting paste is rolled out and cut into small pieces. When the acetone evaporates the horny cordite remains.

Javelle water (solution of sodium hypochlorit) is an ingredient of ink eradicators. The solution is first applied to the ink and a dilute solution of hydrochloric acid is rubbed over it. The chlorin which is liberated is responsible for the bleaching effect.

Contributed by ALBERT TOTH.

TEST CLIP MADE FROM BINDING POST.



For making contact with insulated wires take an old binding post and file the thumb screw to a point. Also cut a portion of one side out with a hack-saw as shown in the drawing. To make contact with an insulated wire, simply slip the wire in the slit in the side and force the thumb screw point thru the insulation. This saves the time and bother of skinning the wire. It also may be used as a helix clip.

Contributed by MERLE E. NANTZ.

FITTING A MINIATURE BULB TO STANDARD SOCKET.

First we need a broken Edison bulb, a miniature lamp and some sealing wax or paraffin. Then break all the glass from the bottom of the large lamp base. Now solder the two wires from the Edison shell to the rim and center of the miniature bulb. Heat some sealing wax and pour in around the shell and set aside to harden. This attachment will be useful to anyone who has a socket with a snap on the side or a pull-chain socket.

Contributed by STAN. DIRVIN.

At Left: Standard Lamp Base Fitted to Miniature Lamp. At Right: Handy Test Clip Made from Binding Post.

CHEMICAL EXPERIMENTS.

No. 1: Put on a clean white plate or saucer, a mixture of pulverized sugar and potassium chlorat. Upon adding a few drops of sulfuric acid a vivid combustion will ensue. By adding with the sugar a few iron and steel filings, and performing the experiment in a dark room, or out of doors at night, fiery rosettes will flash thru a rose colored flame, and produce a fine effect.

No. 2: Mix a teaspoonful of nitric acid with a teaspoonful of sulfuric acid; place a little turpentine in a teacup out of doors, and pour the mixture upon it at arm's length. The turpentine will burn with almost explosive violence.

No. 3: Make a saturated solution of sodium sulfate (Glauber's Salt), in warm water; pour the mixture in a bottle, and let it stand. The salt will remain for months without crystallizing; but if taken up, and shaken a few times, the whole mass will instantly form into crystals, so filling the bottle that not a drop of water will escape. Should there be any hesitation at the moment of shaking, drop a small crystal of the salt into the bottle, and the effect will be instantly seen, by the darting of new crystals in every direction.

No. 4: Heat a piece of tin until the coating begins to melt; then cool quickly in water and clean in aqua regia. The surface will be found covered with beautiful crystals of the metal.

No. 5: Pour dilute nitric acid upon bits of tin. Dense red fumes will pass off.

No. 6: Throw crystals of any nitrat on red hot coals; they will deflagrate with dense red smoke.

Contributed by GLENN HELWAGEN.

PERCENTAGE SOLUTIONS.

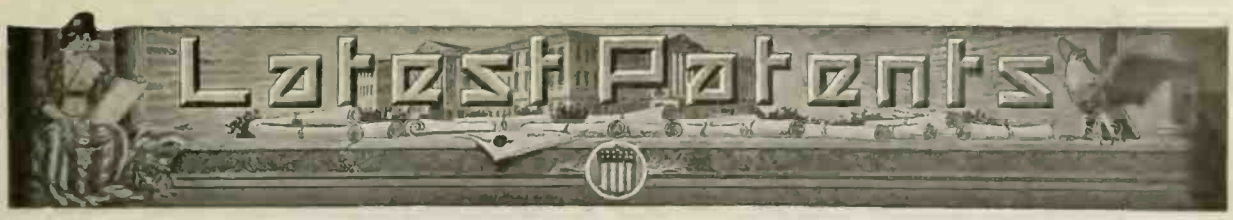
The difficulty about percentage solutions, says *Studio Light*, will disappear if the worker will always bear in mind that one fluid ounce of water weighs 437½ grains, which is, of course, equivalent in weight to one ounce avoirdupois. It follows that if one-tenth that number of grains—*i.e.*, 43.75 grains—of any ordinary soluble chemical is put into a graduated glass and water added to make up one fluid ounce, the result will be a 10% solution.

In the following table the figures are worked out for solutions of various strengths. If the number of grains indicated in the table are taken and sufficient water added to make up one fluid ounce, it will be found that the solution has the required strength.

For a	1%	solution take	4.37	grains
"	5%	" "	21.87	"
"	10%	" "	43.75	"
"	20%	" "	87.50	"
"	30%	" "	131.25	"
"	40%	" "	175.00	"
"	50%	" "	218.75	"

HOW TO FILE SOFT METALS.

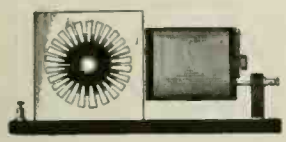
The teeth of a file are soon filled when the file is used on lead, tin, soft solder or aluminum. It cannot be cleaned like the wood rasp by dipping it into hot water, but if the file and the work are kept wet with water, there will be no trouble as the already wet particles of lead, soft solder, etc., do not readily adhere to the file.



HANDY COMPUTER FOR MECHANICS.

Here's the latest vest-pocket computer for electrical and mechanical men. By rotating the cap on end it shows at a glance the size of drill to use for taps from ¼ to 2 inches. U. S. S. Pipe ⅛ to 3½ inches. A. L. A. M. to 1 inch. S. A. E. to 1½ inches also 15 small numbered sizes below 1¼ inches. It has the advantage over blue-prints and chart that it can be easily carried in the vest-pocket.

A Useful Computer for Machinists and Experimenters. It Shows the Size of Drill for Any Tap Instantly.

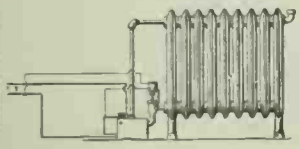


www.americanradiohistory.com

Loose Coupler

(No. 1,276,618, issued to Carlyle B. Campbell.)

This patent relates to an improvement in tuning transformers and particularly to a switching arrange-

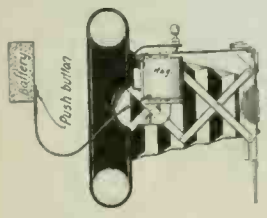


ment by which unused portions of the inductance or winding are completely cut off from the circuit, thereby eliminating undesired effects on the wave lengths. The arrangement shown provides for a plurality of separate coils in close inductive relation. The terminals are connected with solid and spring contacts, adapted to be separated by a revoluble insulating disk in order to cut out certain coils when so desired. In other words, it incorporates a revoluble form of dead-ending switch.

Electrically Heated Radiator

(No. 1,276,573, issued to James J. Rohan.)

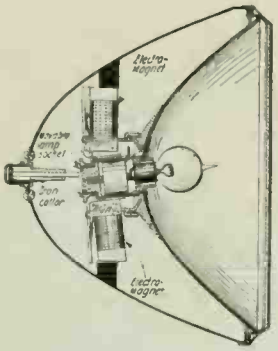
An electrically heated steam radiator of novel design in which there is provided a radiator of the usual form, together with an electrically heated steam generator, this latter being very rapid and economical in operation, it is claimed. Simple and positive means are provided for



automatically controlling the flow of electric current to the heater, and likewise for automatically controlling the flow of water of condensation from the radiator back to the heating device; this automatic control being effected thru the medium of the steam pressure developed within the heating device.

Electric Shutter Trip for Cameras

(No. 1,277,592, issued to Gilbert R. Horton and John M. Miller.)

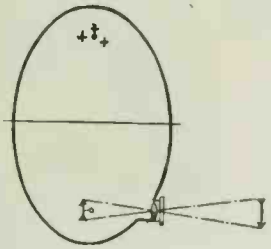


By means of this electromagnetic actuating mechanism for camera shutters, photographs may be taken at a considerable distance from the operator, such as where animals are to be photographed. The length of circuit over which this shutter device may be operated is governed only by the strength of the battery used. A push button or switch is located at the battery, the current completing a circuit thru the small electromagnet fitted to the shutter trip as shown. When the magnet is actuated the shutter is opened; continued pressure on the push button will hold the shutter open.

Electric Headlight

(No. 1,276,605, issued to Overton Winston.)

An improved electric headlight for automobiles and other machines and providing a special means for shifting the electric light bulb with respect to the reflector, whereby the bulb may be moved transversely toward and from the axis of the reflector. A soft iron or steel collar is secured to the rear end of the lamp base, which serves as an armature in cooperation with an upper and lower control electromagnet. These electromagnets are secured to and supported by an annular ring mounted in the lamp housing back of the reflector. Thus the lamp bulb proper may be thrown up or down, simply by actuating one or

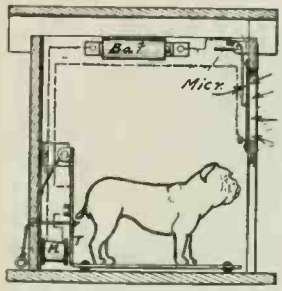


the other of the electromagnets, throwing the light beam either far ahead of the machine or else just in front of it on the ground, as may be desired.

Apparatus for Concentrating and Projecting Radiant Energy

(No. 1,278,026, issued to Salvatore Salto.)

An apparatus for the concentration of light, heat and electric rays and for the projection of these rays in a certain desired manner. This apparatus for concentrating and directing light rays has for its purpose to illuminate objects by concentrating light rays thereon, by means of reflectors with elliptical curvature.

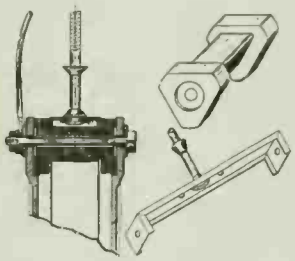


The object to be examined or illuminated may be observed directly by placing it inside the hollow ellipsoid, or projected on a screen by means of a suitable device such as a miscroscope or a magnifying lens. Thus extremely high specific luminous or caloric intensities are obtainable by concentrating emanations from several sources of energy and causing them to be projected. An apparatus such as this may be used as a marine searchlight or coast light, or as a projector for motion picture machines, automobile headlights, etc. The apparatus can also be used for concentrating heat radiations.

A Sound Operated Dog

(No. 1,279,831, issued to Christian Berger.)

When you clap your hands or whistle to this "pup" he jumps out

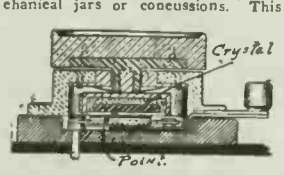


of his kennel in great delight. All because of a clever arrangement of a simple microphone and electromagnet which holds the trip retaining the dog within the kennel, until the sound produced by the clap of the hands or whistle strikes the microphone. At this instant the normal constant current thru the retaining electromagnet drops to a comparatively low value, thus releasing the powerful spring which kicks "Fido" out the door.

Primary Battery

(No. 1,276,754, issued to Walter Grothe.)

A novel arrangement for supporting the electrode elements within a

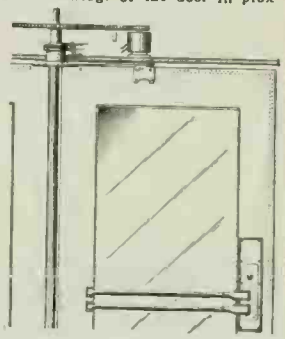


primary battery. The supporting member for the electrodes consists of a flanged yoke having depending ends, while a suspending bolt passes thru a hole in the yoke and is riveted therein. A spool of porcelain is arranged to be clamped against the yoke as shown. The shank and heads are preferably of triangular shape. A perforated container closed on all sides excepting the top, is adapted to be clamped between the depending ends of the yoke and the ends of the clip.

Crystal Detector

(No. 1,277,627, issued to Thomas B. Miller.)

A crystal detector for radio receivers which is claimed to be exceptionally rugged and reliable in design; also its operation is not likely to be interfered with by mechanical jars or concussions. This

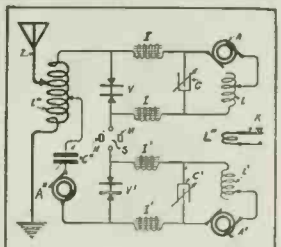


adjustable feature enables the contact member to be placed at any point upon the surface of the crystal desired, and the contact point and and crystal are both enclosed.

Motor-Driven Revolving Door

(No. 1,278,145, issued to Edward C. Haviland.)

Where a revolving door is continuously rotated, electric current is being continuously consumed regardless of the egress or ingress of people thru the door. The object of the present invention is to provide a means whereby a motor for revolving the door is only put in operation when a person is passing thru the door. This device comprises switches carried by the individual wings of the door in prox-



imity to the usual hand-rails, so that they may be either consciously or unconsciously actuated by the person passing thru the door. These switches establish electrical circuits to the actuating motor, but only for such time as is necessary for the person to pass in or out of the door.

Radio-Telegraph Transmitter

(No. 1,278,507, issued to Oscar C. Roos.)

A system in which the discharge of the oscillating circuit condenser may be readily controlled over a wide tone range. The operation is as follows: The high-frequency generator A cannot break down a larger gap than S and the arresters, therefore prevent the discharge of the condenser C" across the gap unless they are simultaneously broken down. They

will be simultaneously broken down $2(n-m)$ times a second where "n" and "m" represent the frequencies of the generators A, A" respectively, so that the tone produced in the receiving system will be the "beat frequency" of said generators. This tone, as will be obvious, may be widely varied by slightly altering the speed of one or both generators. This scheme will thus be seen to afford a very simple and flexible electrical substitute for various mechanical devices such as the "tone wheel," the rotating spark gap, etc.

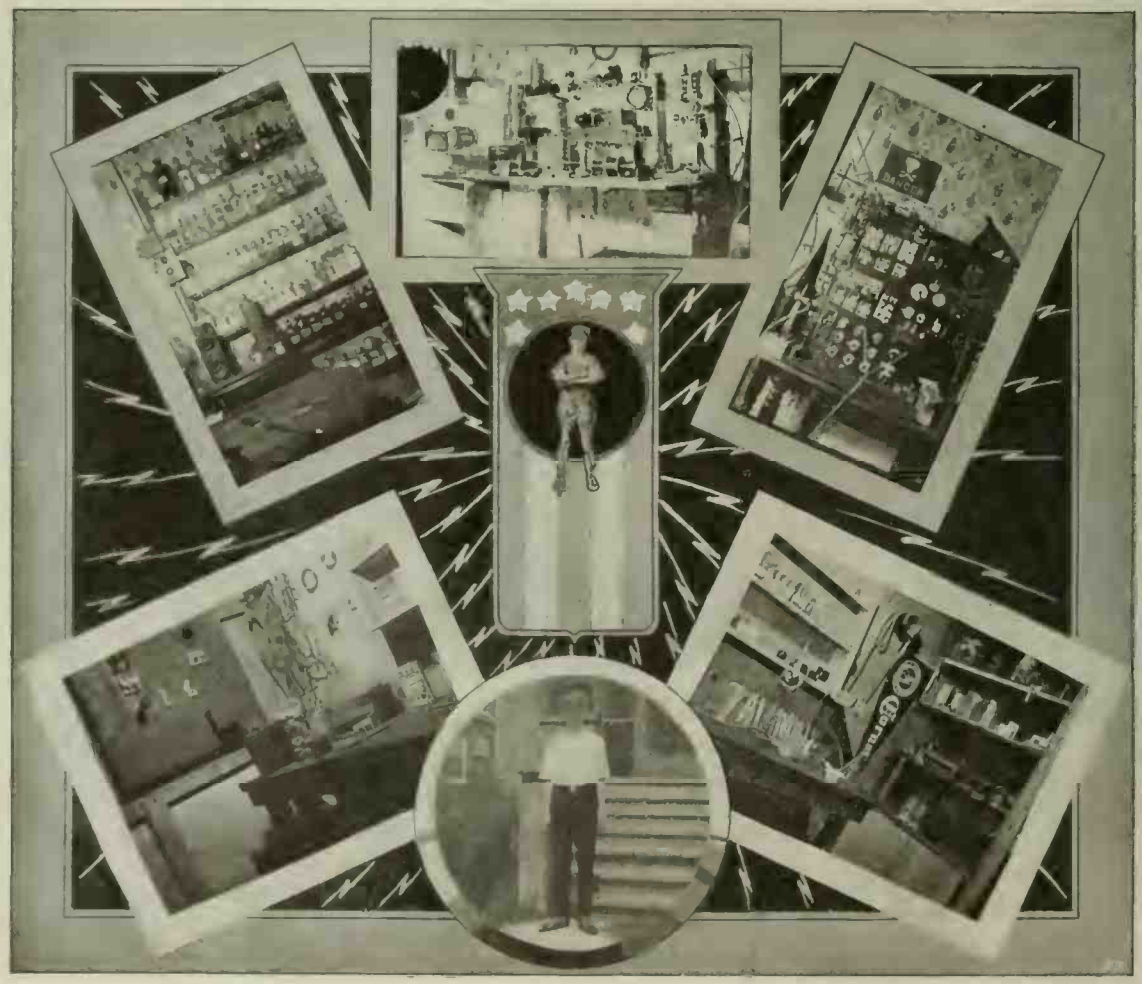
Our Amateur Laboratory Contest is open to all readers, whether subscribers or not. The photos are judged for best arrangement and efficiency of the apparatus. To increase the interest of this department we make it a rule not to publish photos of apparatus unaccompanied by that of the owner. Dark photos preferred to light-toned ones. We pay $3.00 prize each month for the best photo. Address the Editor, "With the Amateurs" Dept.



"Amateur Electrical Laboratory" Contest

THIS MONTH'S $3.00 PRIZE WINNER—ALFRED STACEY

HEREWITH are photographs of my laboratory. On the large table in the center of the room may be seen the radio outfit which was assembled in its original place to take this photograph. When set up it was used with an aerial one hundred and fifty feet high, one hundred feet long, with four stranded wires placed three feet apart. The transmitting set consists of a ½ K. W. transformer, condenser, rotary gap, oscillation transformer, aerial inductance, aerial condensers, and hot-wire meter, keys, etc., also a Poulsen arc and transmitter for radiotelephony. For receiving, I have receiving transformers, variable condensers, fixt condensers, audion, loading coils, Ferron, Galena, and Silicon detectors, two pairs of 'phones, etc. On the experimental table to the left of the radio table may be seen Tesla, audion, step-up and step-down transformers, meters, batteries of different types, motors, generators, telegraph and telephone instruments, condensers, measuring instruments and other electrical apparatus. To the right of this apparatus may be seen the two switch-boards containing circuit breakers, switches, and rheostats for controlling various instruments. To the right of the switch-board may be seen the work-bench for building and repairing instruments. To the right of work-bench, chemicals, elements, retorts, graduates, flasks, hydrometers, thermometers, *ad infinitum*. To the right of this bench will be seen another bench used for the manufacture of chemicals such as bromio, chlorin, etc. Next may be seen the stock-room and dark-room used for photo developing and printing. I have a book-shelf containing over one hundred and fifty chemical and electrical books. This laboratory is the result of ten years' hard work assisted by the famous "Electrical Experimenter" and "Modern Electrics."—ALFRED STACEY, Hamilton, Ontario, Canada.

HONORABLE MENTION (1 Year's Subscription to the "ELECTRICAL EXPERIMENTER") GERALD DITTMAN

I PRESENT herewith photograph of myself and two of my laboratory. I am eighteen years old and have had my laboratory for about a year. I have a great number of chemicals which I use for testing foods and for mixing up different solutions to see what effect they have on electricity. I have made an arc light which furnishes all my illumination. I use an ammeter to show how much current I am drawing and in that way save fuses, because when the pointer approaches ten amperes, I know a fuse will blow and I can shut it off in time. I also have a number of motors, a transformer, spark coils, condensers, Leyden jars and other instruments which I use for various experimental purposes.—GERALD DITTMAN, Chicago, Ill.

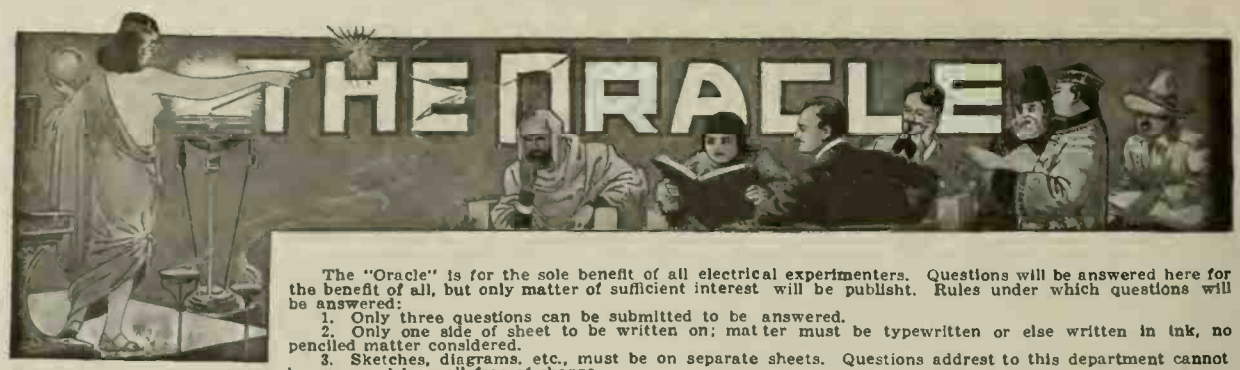
Phoney Patents

Under this heading are publisht electrical or mechanical ideas which our clever inventors, for reasons best known to themselves, have as yet not patented. We furthermore call attention to our celebrated Phoney Patent Office for the relief of all suffering daffy inventors in this country as well as for the entire universe.

We are revolutionizing the Patent business and OFFER YOU THREE DOLLARS ($3.00) FOR THE BEST PATENT. If you take your Phoney Patent to Washington, they charge you $20.00 for the initial fee and then you haven't a smell of a Patent yet. After they have allowed the Patent, you must pay another $20.00 as a final fee. That's $40.00! We PAY YOU $3.00 and grant you a Phoney Patent in the bargain, so you save $43.00!! When sending in your Phoney Patent application, be sure that it is as daffy as a lovesick hat. The daffier, the better. Simple sketches and short descriptions will help our staff of Phoney Patent Examiners to issue a Phoney Patent on your invention in a jiffy.



Prize Winner: WEEWEEEPIGORGAN. Take one gross pigs fresh and lusty, assort according to musical scale, put each in soundproof chamber, attach tails to electromagnetic claws operated by keyboard. Pigs run on endless belts furnishing power for organ. Depressing keys on keyboard pinches pigs' tails. Pig sings weee—weeeee—weee, as long as key is pressed. Don't use old sows. They sow discord. French airs go well on this organ due to the oui, oui!! Inventor: Paul Gaugewere, Bethlehem, Pa.

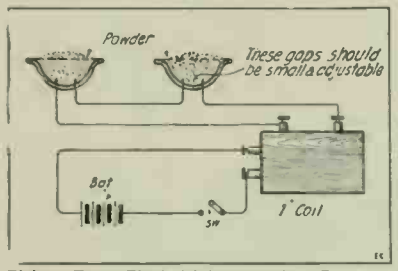
The "Oracle" is for the sole benefit of all electrical experimenters. Questions will be answered here for the benefit of all, but only matter of sufficient interest will be publisht. Rules under which questions will be answered:



1. Only three questions can be submitted to be answered.
2. Only one side of sheet to be written on; matter must be typewritten or else written in ink, no penciled matter considered.
3. Sketches, diagrams, etc., must be on separate sheets. Questions addrest to this department cannot be answered by mail free of charge.
4. If a quick answer is desired by mail, a nominal charge of 25 cents is made for each question. If the questions entail considerable research work or intricate calculations a special rate will be charged. Correspondents will be informed as to the fee before such questions are answered.

FIRING TWO FLASH-LIGHT POWDER PANS SIMULTANEOUSLY.

(970) Fred Wheeler, Galt, Ont., Can., wants to know:

Q. 1. How to fire two or more flash-light pans simultaneously.

A. 1. For firing flash-light powder at two places simultaneously, we refer you to arrangement as per diagram. Use a spark coil and battery as indicated in diagram. Wire the two or more flash pans in series. Keep the spark gap in each pan small—1/16" gap is sufficient.

Firing Two Flash-Light Powder Pans at Once by Means of Spark Coil. Several Flashes May Be Ignited at Once.

HOW TO TELL DYNAMO POLARITY.

(971) Paul Miles, Chicago, Ill., inquires:

Q. 1. How can the positive terminal of a small D. C. dynamo be determined?

A. 1. Off-hand we cannot tell you which is the positive brush. However, we advise you to make the following test: In a 50% solution of salt water put two wires connected to the dynamo, and note from which wire the most bubbles come off. This is the negative wire.

A 4-volt dynamo will give about 3 amperes. However, much depends upon the condition of the brushes (contact, pressure, etc.), and the condition of the batteries. We would advise you to refer to "Lessons in Practical Electricity and Magnetism," by Swoope, which can be purchased thru our Book Department for $2.25, postpaid.

SPEED CONTROL OF A.C. MOTORS.

(972) Hugh McPherson, Borden, Sask., Can., asks:

Q. 1. How can I control the speed of a 30 H.P. A.C. 3-phase motor?

A. 1. The speed of the 30 H.P. A.C. 3-phase motor can be regulated in several ways, some of the best of which are as follows:

The voltage applied to the motor is varied by a transformer from which several taps are brought out to a controller, thereby varying the speed. Again, by means of an induction regulator which consists of a primary and secondary winding, having an iron core with one of the windings so arranged as to allow of being varied thru 180 magnetic degrees.

The above methods are really best for single-phase service, while the following method is very good for the three-phase service: In this method the speed can be varied by changing the number of poles of the motor connected in the circuit by means of suitable switches or by varying the current by a suitable rheostat connected in the respective legs of the wound rotor circuits. This last method also applies to the single-phase system, wherein the current is varied by means of a rheostat.

ODD PHOTOS WANTED AT $1.00 EACH!!!

Now is the time to make your Kodak pay for itself in a real practical way. We are after interesting photographs of out-of-the-ordinary electrical, radio and scientific subjects and are willing to pay $1.00 cash for every one we can use. Please bear in mind that for half-tone reproduction in a mogazine, a photograph should be particularly sharp and clear. Of course, if a subject happens to interest us particularly well, we can have the photo retouched. For the general run of subjects, however, it does not pay to go to such expense. Therefore, please take pains to properly focus and expose your pictures. It often happens that a really mediocre subject well photographed wins approval over an excellent subject poorly photographed. And don't send us plate or film "negatives"; send unmounted or mounted "prints", preferably a light and dark one.

As to what to photograph: Well, that's hard for us to say. We leave that up to you, and every reader now has the opportunity to become a reporter of the latest things in the realm of Electricity, Radio and Science. But, please remember—it's the "odd, novel or practical stunts" that we are interested in. Every photo submitted should be accompanied by a brief description of 100 to 150 words. Give the "facts"—don't worry about the style. We'll attend to that. Enclose stamps if photos are to be returned and place a piece of cardboard in the envelope with them to prevent mutilation. Look around your town and see what you can find that's interesting.

Address photos to—Editor "Odd Photos", ELECTRICAL EXPERIMENTER, 233 Fulton Street, New York City.

LOOSE COUPLER AND DISTRIBUTED CAPACITY.

(973) C. W. Opert, Freeport, Ill., wishes to know:

Q. 1. Several points about making a loose coupler transformer for radio receiving circuits.

A. 1. In constructing a loose coupler, the best way to take the taps off is as follows: At the required part of the coil, punch a hole in the cardboard tube and bring about 18 inches of wire right thru this hole by looping the wire, and then pushing it thru. All that remains to be done now is to continue winding the coil until all the taps have been made.

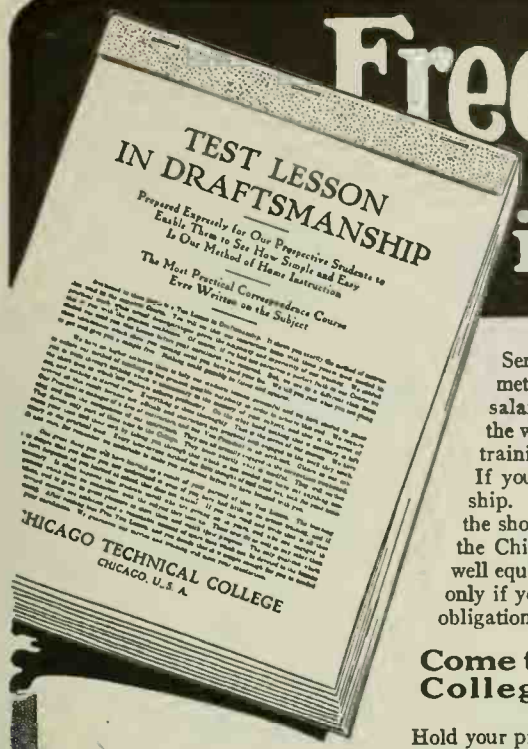
We provide coils with dead-end switches in order to get rid of the *distributed capacity*. Distributed capacity is the capacity which exists between the turns of a helical coil, and for your benefit we refer you to an extensive article on this subject which was printed in the May, 1917, issue of this journal.

TESLA COIL FOR 2-INCH SPARK COIL.

(974) R. Conover, New York, N. Y., inquires of "The Oracle":

Q. 1. For data on a Tesla coil suitable for use on a 2-inch spark coil as an exciter.

A. 1. The ordinary Tesla coil, especially designed to work with a spark up to 2 inches on the primary side will do, and is briefly described as follows. The primary should consist of 14 turns No. 10 solid, rubber-covered copper wire in one layer on a spool 4½ inches in diameter, while the secondary consists of a coil 2¾ inches in diameter and 12 inches long, wound its full length with a layer No. 28 enamel wire.



This size of Tesla coil can be furnished by the leading companies who advertise in our magazine. It is best to use two one-pint Leyden jars connected in parallel or a one-quart Leyden jar.

The construction for a glass plate condenser for the above Tesla coil is as follows: Procure five glass plates 6x7x1/16" and four pieces of tin-foil 5x6 inches. The tin-foil should be placed between the five plates so that two ends of the tin-foil protrude from the sides of the glass. The size of the spark obtained from the above Tesla coil will be about ¾ to 1 inch and can be taken thru the body without any harm.

Free Test Lesson in Draftsmanship

Send for this free lesson which explains the Chicago "Tech" method of teaching Draftsmanship by mail. Positions at big salaries are now waiting for competent men. The call of men to the war has left vacancies everywhere. Even draftsmen of limited training and experience are snapped up and paid good salaries. If you are dissatisfied with your opportunities, learn Draftsmanship. Chicago "Tech" will train you in the most practical way in the shortest time. Mail the coupon today and let us tell you about the Chicago "Tech" method. This free lesson will show you how well equipped you are to follow Draftsmanship. Enroll in the course only if you decide that you can take it up to advantage. No cost, no obligation on you to make this investigation.

Come to the College or Learn At Home

Hold your present position while training. Our experts will instruct you by mail. Only your spare time is required. You are directly under practical draftsmen and engineers. You are taught exactly the work required in the drafting rooms of big concerns. No time to put in on unnecessary studies. This means thorough instruction and early graduation.

$25.00 to $100.00 a Week

Draftsmen earn good salaries in normal times. They command extra high salaries now—and the tremendous work to be done after the war will bring a permanent and intensive demand for good men. Make your spare time count now for a higher salary and a better position.

Auto and Gas Engine Course

All about automobile mechanism—its construction, operation and REPAIR—taught by mail. You train directly under the Chicago "Tech" automobile experts. Splendid opportunities open now.

Learn All This In Spare Time

Principles of the Automobile. Every point made clear about the basic principles of propulsion, power, transmission systems, etc., etc.

Gasoline Engines. All about the different types. A complete course in gas engine construction, operation and repair.

Power Plants and Transmissions. Application of power, by 4-6-8-12 cylinder engines. Types of clutches. Gears, Drives, Axles, etc.

Carburetors and Fuel Supply Systems. All methods demonstrated. Fuel values. How to test. Gasoline and air mixtures. Regulation, etc., etc., etc.

Lubrication and Cooling. All about oils and how to test them. Splash and circulating systems. Operation in different cars explained. Diagrams, etc., etc., etc.

Batteries. Electrical principles explained. Instructive diagrams of wiring and connections, etc., etc.

Magneto Ignition. Principles and practical operation of various types and systems with diagrams. Generation of current. Field, armature, high and low tension, all explained. Complete in every point.

Starting and Lighting Systems. All modern methods. Starters—spark, mechanical, air, acetylene, electric, battery—shown in detail with diagrams and full explanations. Charging. Motor and generator adjustments, etc., etc.

Know How to Fix Troubles

Most complete instruction in auto repair work. Equips you for high pay or to start a business. Big demand for trained repair men.

WRITE

Send the coupon and get catalog and all information—now.

Easy Payments

The fees for Chicago "Tech" Courses are very moderate—and you can pay on easy terms. And also—you obtain in a few months what it would take several years to acquire by ordinary methods. You can get an early start. You are soon ready to take a paying position and to quickly get back the cost of your course.

Send the Coupon

The sooner you are prepared the sooner you will be holding a job that pays a large salary and opens the way to advancement. Many executives, general managers and superintendents began as draftsmen.

Other institutions ask you to pay first—and then to find out later how well qualified you are for this profession. We send the free lesson first and place you under no obligation at all. Discover your qualifications before you pay anything.

The coupon will bring the Test Lesson, free. Also information about the profession of Draftsmanship and detailed facts about Chicago "Tech" methods, the fees, terms, etc. Mark with X the branch you are interested in—or if in doubt about which course to take, write a letter stating facts about yourself and asking our advice which will be freely given. Mail either the coupon or the letter today.

FREE Instruments

Every student of the Chicago "Tech" Course in Draftsmanship receives this set of instruments, or a cash credit in case he already has a set. These instruments are of the same make and sizes as used by high salaried experts in drafting rooms of factories, shops, railroads, etc. You use them while learning—then take them right into your practical work.

Chicago Technical College,
145 Chicago "Tech" Building, Chicago

Without obligation to me, please send me your FREE Test Lesson and other interesting literature covering the subject indicated below. Mark X opposite work in which you are specially interested.

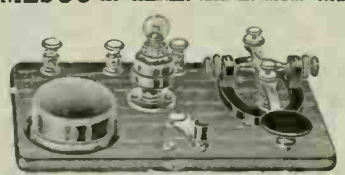
Mesco Telegraph Practice Set

For Learning Telegraph Codes

The Practice Set comprises a regular telegraph key, without circuit breaker, a special high pitch buzzer, one cell Red Seal Dry Battery, and four feet of green silk covered flexible cord.



The key and buzzer are mounted on a highly finished wood base, and three nickel plated binding posts are so connected that the set may be used for five different purposes.

List No.		Price
342	Telegraph Practice Set, with Battery and Cord	$3.24

Weighs 4 lbs. packed.

Price does not include postage.

MESCO Combination Practice Set for learning the Morse and Continental Visual and Audible Codes

This outfit is the only reliable instrument which will enable students to become proficient operators in the U. S. Naval Service, because it is equipped with a buzzer and miniature lamp enabling the user to master both the visual and audible signals quickly.

List No. 52—Practice Set with Red Seal Battery and Cord.....$4.05

Weighs 4 lbs. packed. Price does not include postage.

Send for the New Edition of Our Catalog W28

It is pocket size, contains 248 pages, with over 1,000 illustrations, and describes in plain, clear language all about Bells, Push Buttons, Batteries, Telephones and Telegraph Material, Electric Toys, Burglar and Fire Alarm Contrivances, Electric Call Bells, Electric Alarm Clocks, Medical Batteries, Motor Boat Horns, Electrically Heated Apparatus, Battery Connectors, Switches, Battery Gauges, Wireless Telegraph Instruments, Ignition Supplies, etc.

RECORDING SPEECH ON A MOVING IRON WIRE.

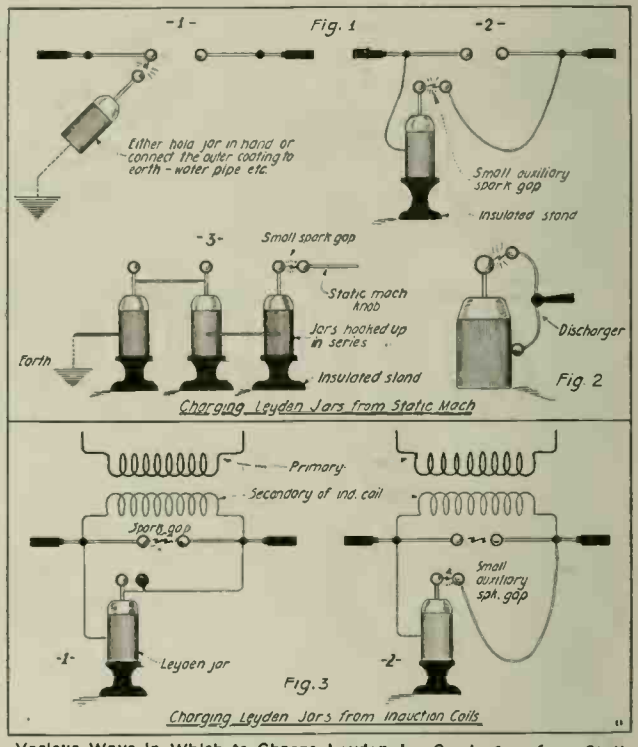
(975) Miss Clara B. Griffin, Carthage, Ill., writes this Department:

Q. 1. Can an instrument known as the *Telegraphone* record speech?

A. 1. Relative to your inquiry regarding the *Telegraphone*, an instrument invented by Valdemar Poulsen of Denmark, we are pleased to state the following:

This instrument will record speech on a thin steel wire by recording the fluctuations of the magnetic lines of force set up thru a set of magnet coils. A full description of this machine was given by Samuel Cohen in the June, 1915, issue of this Journal; an article also appeared in a back issue describing iron disc type of Telegraphone designed as a dictating machine for business offices.

CHARGING LEYDEN JARS.



(976) Mr. B. Brewater, Dedham, Mass., asks:

Q. 1. Different ways to charge Leyden jars.

A. 1. We are giving a sketch herewith how to charge the ordinary Leyden jar by means of a static machine. The best way is to hold the jar in the hand and let sparks from one of the balls of the static machine jump over to the central ball of the Leyden jar. At first the sparks will jump fast, then as the jar becomes charged they will grow smaller and smaller, finally hardly any sparks will jump at all. This shows that the Leyden jar is fully charged. It can then be discharged by means of the ordinary discharger as shown in Fig. 2.

The important part to remember is that not every glass can be used for Leyden jars. Here is where many an experimenter is disappointed. Only *potash* glass can be charged—all the other varieties, such as *flint* and *lead* glass, "leak"—it being impossible to sustain a charge for even one second if such glass is used in the Leyden jar. If no *potash* glass is procurable, an ordinary phonograph disc coated on both sides with tinfoil will answer. Good results can also be had by using hard rubber sheeting. This material does not "leak."

It is not possible to charge Leyden jar by means of spark coils in the way the jars are charged with a static machine. In other words, the jars can never be fully charged and kept standing for a few seconds and subsequently discharged as if they had been charged with the static machine. The method to charge the jars with a spark coil is shown in our illustration, Fig. 3. In order to get the charge, it is necessary to hold the discharger as shown, and a continuous discharge will flow across the two knobs. The quality of the spark is the same whether charged by a static machine or Leyden jar, except that in the case of a static machine the spark will sometimes leap several inches, while the jar charged with a spark coil will only leap an eighth or one-quarter of an inch, and in extreme cases one-half inch.

Various Ways in Which to Charge Leyden Jar Condensers from Static Machines and Induction Coils.

DOES A PERSON WEIGH MORE AFTER EATING.

(977) Querist, New York City, inquires:

Q. 1. Does a person weigh more after drinking say, 25 glasses of beer, or eating 10 lbs. of beefsteak (as often happens at beefsteak eating contests), or will their weight remain the same? "A" says they will weigh the same; "B" says their weight will increase in exact accordance with the amount of food or drink taken into the stomach.

A. 1. This is an interesting question and one that has been asked hundreds, even thousands, of times. The Editor of this column recollects that the usual answer by the man in the street is to the effect that he will weigh exactly the same. He will, eventually, but—well, listen to the learned arguments put up by three well-known New York medical authorities.

Says the New York Medical Journal: In the case of eating, say, a pound of meat or drinking a pint of water, the weight of the human being is increased immediately after. In the course of two or three hours, however, the weight will return to normal, due to evaporation of moisture from the lungs and pores of the skin, also to digestion.

Dr. Sinclair Tousey, the well-known New York medical authority, says: Immediately after eating one pound of meat, the person in question would have *less* than one pound added to his weight. Owing to the increased evaporation of moisture from the

Learn Electricity

In the Great Shops of

COYNE

Trade and Engineering Schools
Dept. 21, 39-51 E. Illinois St., Chicago, Ill.

PRACTICAL INSTRUCTION

FINISH IN 3 MONTHS

Thousands of skilled Electricians are needed. The demand is becoming more urgent every day. The Government is employing every one they can get which is causing a great scarcity throughout the country and big salaries are being paid everywhere. Right now is *your* big opportunity. Make up your mind now to prepare for one of these big jobs and then get here as quick as you can for your training.

Earn $100.00 To $300.00 A Month

In the Electrical business. Come here where you will be trained in these great $100,000 shops. Experts show you everything and you learn right on the actual apparatus. You work on everything from the simple bell to the mighty motors, generators, electric locomotives, dynamos, switchboards, power plants, everything to make you a master electrician. We have thousands of successful graduates. Just as soon as you have finished we assist you to a good position. We now have more positions than we can fill. Think of it.

PREPARE TO SERVE YOUR COUNTRY

War Demands Have Taken Thousands of Men from this Profession. Men *Must* be Trained to Fill their Places. Prepare *Now* for a Big Paying Position.

These courses are thorough, short and practical. All instruction given on the actual equipment. Each man is trained individually and stays until thoroughly trained. Start any time—day and evening classes.

Our graduates are in great demand. We are continually receiving letters, telegrams, and telephone calls from contractors, manufacturing firms, etc., seeking our graduates to fill responsible positions. We have now more positions than we can fill and the demand is steadily growing. Every comfort is given our students while here. They live in comfortable homes in the most beautiful section of Chicago—on the lake.

The War is Over—Yes!

but the men "over there" will not be back for months—perhaps years, for their work "over there" isn't over. And so you, and thousands more must fill up the gap now that the absence of these brave workers has made in the ranks of skilled labor. Trained Electricians are needed more, perhaps, than any other class of men. The sudden ending of the war has caused the big industries to start up work sooner than any of us expected and in consequence the Manufacturers are Calling for Trained Men, and we are training men as fast as we can to meet these urgent calls. You are needed, Young Man, now! Don't wait. Don't put it off. Get in touch with us Today. Get ready to join the great "Peace Army" here at home.

Your country calls. Again we say, prepare to serve your country! We'll make a trained electrician of you in three months! Let's go!

LEARN DRAFTING

Skilled Draftsmen are always in demand. Our courses are thorough—short—practical, preparing a man fully to hold a position of responsibility. We have more positions than we can fill. We also have thorough practical courses in Plumbing and Heating, Motion Picture Operating and Bricklaying.

EARN YOUR WAY

Many students earn their living expenses by doing a little work in their spare time. Our employment dept. furnishes these positions without charge.

THE ORACLE.

(*Continued from page 648*)

pores of the skin, also from the lungs, this slight difference would occur immediately. But in two or three hours, due to the foregoing causes, also digestion, the weight will gradually decrease to normal.

Dr. William Benham Snow, of New York one of the leading American electrotherapeutists and medical men, states: The increase of weight in the human being after eating, say, one pound of meat varies greatly. In some instances there is no *increase* at all; while in others there is a *slight* (but never the full weight) increase, all depending upon the individual's respiratory and digestive organs. In the case of water, the full weight of the water is added to the person's weight, but within a very short time after the weight will rapidly decrease to normal.

It has been a widespread and popular idea that if a person were to lie on his back and hold his breath that he could be lifted with two fingers. This has been done by hypnotism, but not otherwise.

ELECTROLYTIC RECTIFIER.

(978) H. H. Mosehauer, Wortendyke, N. J., writes:

Q. 1. I have made a small Electrolytic Rectifier for charging storage batteries. This rectifier was built from instructions in the Scientific American Supplement No. 1644. According to the instructions, the liquid consists of one pound of crystalized sodium orthophosfate (per jar).

I am having great trouble getting this chemical. Some drug houses I have been to do not seem to know what it is at all. Could you advise me where I can get it? Or what other chemical I could use instead?

A. 1. Relative to your electrolytic rectifier, would advise that the majority of these rectifiers, even the larger sizes, are operated with a solution composed of sodium bicarbonat (baking soda) dissolved in water until the solution is saturated, i. e., until the water will not absorb any more of the bicarbonat. Another very good solution is composed of water in which there is mixed ammonium phosfate. A saturated solution of this is also employed.

The matter of the solution used is not a very important one, it being more important that a good, pure grade of aluminum is employed. Ordinary salt and water has been used in electrolytic rectifiers in emergency for that matter, and also wherever a solution seems to have too high a resistance or where a sufficient current is not obtained, a few drops of sulfuric acid may be added to the water to make it more conductive. If you have further trouble in getting the rectifier to operate, it is well to note that the aluminum plates have to be "formed" and this has sometimes to be accomplished by running the rectifier for five or ten minutes or so connected to a lamp bank so that this or similar resistances on the D. C. side can pass a fairly strong current thru the rectifier, and cause the necessary oxid to form on the aluminum electrodes.

2 K.W. "PIPE THAWING" TRANSFORMER.

(979) Mr. Wm. E. Newton, Ontario, Canada, writes the "Oracle" Dept.:

Q. 1. I would like to make a transformer for thawing ½-inch frozen water pipes and want a secondary current of 150 amperes at 10 or 12 volts, as I would only need to thaw about 10 or 12 feet at a time. The primary winding is to be supplied by 110 volts, 25 cycle alternating current. I have plenty of soft stove pipe iron at hand from which I could make the core, which, I suppose, would be of the closed core type. Please give dimensions of core, size, number of turns, and weight of wire required for primary. What kind, size, number of turns of wire required for secondary?

A. 1. We give below data for constructing the transformer in question:

Data for 2 K. W. 150 amp. 13.3 volt secondary "pipe thawing" transformer, for operation on 110 volt, 25 to 30 cycle A. C.

Core Data:—The sheet iron core should measure about 17½ inches in length by 8¾ inches in width ontside dimensions, its thickness and breadth should be 3 inches, or, in other words, 3 inches square. Both of the longer legs of the core should be thoroly insulated with five to six layers of oiled linen or Empire cloth, well shellacked.

Primary Winding:—This may consist of 244 turns of No. 9 B. & S. gage D. C. C. copper magnet wire wound in even layers on one of the long legs of the core. This will require about 2 pounds.

Secondary Winding:—The secondary coil to delivery 150 Amp. and 13.3 volts at full load may comprise 31 turns of No. 0, B. & S. gage D. C. C. copper magnet wire, or if this is not convenient, owing to its large size, you may wind on simultaneously two No. 3 B. & S. gage D. C. C. conductors side by side, or four No. 6 B. & S. gage D. C. C. conductors. The terminals of the separate wires, if a multiple winding is used, are joined together so as to connect all the wires on parallel.

The efficiency of this size of transformer is about 95 per cent with respect to the watts input at the primary and the watts output at the secondary

Knowing the size of the core you can readily compute the weight of wire for the windings by consulting any wire table. The circular mils area of the No. 9 B. & S. gage wire is 13,594 c.m., while the circular mils area of the No. 0 B. & S. gage conductor is 105,592 c.m.

A NEW TOGGLE SWITCH.

The toggle surface switch illustrated differs from the ordinary snap switch in that manipulation is by the throw of a lever or toggle, instead of by the turning of a

Showing Interior View of Single Pole Switch.

Appearance of New Toggle Switch.

key or button. Throwing the lever up makes the circuit; throwing it down breaks the circuit. The movement is positive—the make-and-break quick and snappy. The toggle switch has been used in Europe for a number of years, but was slow to find favor in America.

The advantages of the toggle movement in a surface switch are stated as three-fold—first, it permits making the switch more attractive and stronger than the ordinary switch; second, manipulation is much more convenient by means of the lever than by the turning of a key; third, the switch is self-indicating, the position of the lever showing at a glance whether the current is "on" or "off" without any marker or dial.

It combines in unusual degree the best mechanical and electrical features, with an appearance which makes quick appeal to those seeking the dignity of simplicity and richness.

www.americanradiohistory.com

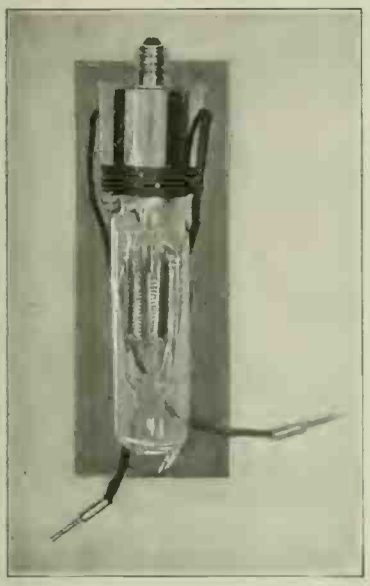
RADIO-TELEPHONE GUIDED U. S. FLYERS MANY MILES AWAY.

(*Continued from page 629*)

require amplifying more than from ten to fifteen times.

Fig. 3 shows a new form of oxid filament tubular audion as supplied on U. S. Army and Navy sets. This bulb is provided with a special base, making it very convenient for attachment or replacement, and tests made with this bulb show the life to be about five thousand hours.

Fig. 4 shows an improved form of audion control panel. A number of new radio engineering features are incorporated in this apparatus, including deeply grooved, insulating terminal blocks which carry the binding posts. Integrating condenser switches are employed for regulating the capacity of the bridge and stopping condensers. The ammeter at the right of the panel indicates the filament current at all times. A special form of grafite potentiometer is mounted just below the filament



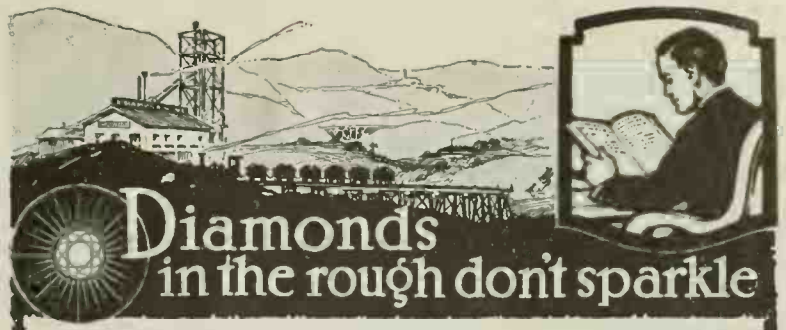


Fig. 3. New Form of Oxid Filament Audion as Supplied on U. S. Army and Navy Radio Sets.

ammeter to regulate the wing current.

Fig. 5 shows a large capacity oscillion bulb and control instruments mounted on a self-supporting panel for radio-telegraphic transmission. The bulb is mounted between upper and lower rings of heavy, rubber-covered wire. The loading coil switch for varying the antenna wave length is mounted in the upper left hand corner of the panel. Terminals for the Morse telegraph key are fitted at the bottom of the panel. A radiation hot-wire ammeter is seen at the left of the switchboard, while a three-pole switch controlling the filament and wing current appears at the right. The necessary condensers and auxiliary apparata are compactly mounted on the back of the panel.

A ½ K. W. oscillion is good for 150 miles radiophone transmission over water, or 250 miles radio-telegraph signalling over water. A 1 K. W. outfit has a range of 200 miles radiophone or 300 miles radio-telegraph over water. A 2 K. W. will talk 300 miles or telegraph 400 miles over water. These ranges can be greatly increased by the use of two to six stage audion amplifiers. The six stage audion amplifier has an amplifying factor of *one million* times.

WITHOUT training you are a diamond in the rough. You can't make the most of your **natural ability.** Your **real value** is hidden—always will be until you cut away the rough spots and **polish up** with **practical training.** That's all you have to do to put yourself in the position **where you want to be**—and where you rightly belong. There is no secret to success. It is just a question of mentally equipping yourself with practical training. You have the same chance as the "other fellow"—if you train. What are you going to do?

Why Not Get a Better Job?

What would it mean to you if your salary was doubled tomorrow? What would $5.00, $10.00 or $20.00 more a week enable you to do? It would mean a whole lot more pleasure in life—a lot more satisfaction, wouldn't it. **Then why not get it?** You can! It is not impossible or even a hard task. It is simply a matter of fitting yourself for the position and pay you want. Only by training can you capitalize on your **natural ability. If you can get what you are now earning without training,** think what you could make with it. You have a lifetime of work ahead of you—so why not put in your time in congenial, profitable work. Thousands of American School Students will tell you it **pays to train.** Let us send you some proof of what our training has done for others,

Wonderful Opportunities Await Trained Workers

If you are untrained, take a look into the future. Now that the war is won, there is a period of reconstruction coming which will mean unparalleled opportunity for men who can think and act for themselves—trained men. The war-torn countries of Europe must be reconstructed and America must do its share. America must also catch up with time lost in its own industrial activities. If you want to share in the prosperous times ahead **you can do it.** Get busy—now—and fit yourself with practical instruction that is guaranteed to satisfy you, and, therefore, guaranteed to make you make good.

Do Yourself a Favor

Make up your mind today to fit yourself for a more congenial position and bigger pay. You can do this—easy—if you will devote a part of your spare time to study. Keep on earning while you're learning. Check and mail the Coupon for Big Free Bulletin and details of Money-Back Guarantee.

WHY DON'T YOU GET AN AUTO-WHEEL?

FELLOWS who know will tell you that the Auto-Wheel Coaster and the Auto-Wheel Convertible Roadster are the best wagons ever built for speed and stregth. Wheels have roller bearings, steel axles and tires, and the spokes are oval, like an auto.

Send For Free Felt Pennant

Write us names of three coaster wagon dealers and we'll send you a beautiful Felt Pennant FREE. We will also tell you how to organize a Coaster Club. It's great fun. Each member receives a cap and the captain a special cap. Write today.

BUFFALO SLED COMPANY
163 Schenck Street - N. Tonawanda, N. Y.
(In Canada: Preston, Ont.)

BOYS Build and Fly Your Own Training Plane

Train yourself in Aviation. Be an Amateur Aviator with an Aeroplane of your own. Learn how Aeroplanes are built; learn the principles of construction, operation and control. We sell IDEAL Accurate Scale Drawings, and Building and Flying Instructions which show you how to build a perfect Model Aeroplane, 3 ft. size, that will rise from the ground by its own power and fly like a big one. Send now for the Drawings and Instructions for the one you want to build.

Drawings and Instructions for
Curtiss Military Tractor
Bleriot Monoplane
Nieuport Monoplane
Tauba Monoplane
Curtiss Flying Boat
Wright Biplane
Cecli Paoli Racer

25c EACH

New Aeroplane Catalog 5 cents—None Free

Tells about Model Aeroplanes, Racing Aeroplanes, Flying Toys, and parts and supplies to build them with. 48 pages. Sent only upon receipt of 10 cents.

IDEAL AEROPLANE & SUPPLY COMPANY
78-82 West Broadway New York City

CHEAPEST WAY TO GO

Is on a bicycle — a dozen miles for a cent. That's why in Europe one every six persons rides a bicycle. All armies use them by thousands. It is the workman's street car, with the cost of the rides saved. A complete outdoor gymnasium that keeps you fit in mind and muscle.

Mead's Factory to Rider

Sales Plan Saves you $10 to $20 on all latest war approved Ranger models. 30 Days Free Trial and Free Delivery. TIRES Parts, Repairs at half usual prices. Don't buy until you get our Big Free Catalog describing all the wonderful new offers, liberal terms and low prices. Write a postal now.

SALT FROM THE SEA BY ELECTRICITY.

A company is about to start the exploitation on a large scale of a method for extracting salt from sea water. The undertaking is being backed up by a number of men of exceptional standing. The process is due to Professor Helland Hansen, and the venture is backed by $5,000,000. It will in all probability be found expedient to erect several works along the coast of Norway as more electric energy becomes available. The comparatively large capital is principally necessary on account of the large plant needed, pumping stations, etc., absorbing the bulk of the power; the production of the salt itself only requires a small amount of energy and is consequently cheap. As to the location of the new factories, no definite decision has been arrived at, but Stavanger has been mentioned as a likely place for the first factory, and the Giaamfjord for the second.

A MELODIOUS PHONOGRAPHIC REPRODUCER.

By Frank C. Perkins.

The accompanying illustrations show the details of construction of a new phonographic reproducer, developed at Milwaukee, Wis., which it is said "Humanizes a Talking Machine". It is claimed that this reproducer plays perfectly all disc record selections, even the subtle tones of the instrumental accompaniments and prevents

Something New in Phonograph Reproducers. This Particular Type Has a Diaframm of Special Composition, and the Stylus Arm is Secured Thru a Bridge Arrangement, Similar to the Sounding Board of a Guitar. It Is Said to Give Excellent Reproduction.

clash and approaches the living voice, whether of soprano, contralto, tenor, baritone or bass, quite as natural as life. Even the resonance of the violin and the tone of the flute are marvelously perfect.

It is held that band records are reproduced with all the tone values of instruments, every overtone and undertone brought out harmoniously, without nerve-wrecking stridency, while orchestral combinations are greatly improved. The recordings of the great symphonies are revivified with all the original sublimity; reanimated in just the right volume for home enjoyment. The violins, cellos, oboes, clarinets, bassoons, saxophones, flutes, piccolos, horns, the "brasses" including the great tuba, the "percussion" containing drums, cymbals, bells, special effects as the imitations of birds, church chimes, are all as real as the record is made.

Any talking machine can be equipt with this reproducer in a moment, without tools. Either steel or fiber needles will work perfectly with the reproducer, whose weight is less than four ounces, so that records wear indefinitely if care is used.

EXPERIMENTAL STUDIES IN ELECTRICITY AND MAGNETISM, by Prof. Francis E. Nipher. Publisht by P. Blakiston's Son & Co., Philadelphia, Pa. 72 Pages, size 9½ x 6⅛ inches, illustrated, cloth bound. Price $1.25.

The student of electricity and magnetism will find many novel, new and decidedly interesting experiments described in this work. The author is well known in scientific circles and of very high standing. Furthermore, what he has to say to us in this presentation is of more than ordinary interest. Some very interesting photographs of sparks and spark shadows are given with some new theories as to their meaning; causes of local magnetic storms; the effect of "wind" on magnetism; and also the effect of "clouds" on the magnetic needle. These effects are indeed wonderful, and so new as to demand the attention of every earnest electrical student. Professor Nipher has performed some very interesting experiments in the laboratory and also in the field along these lines, and if you wish to read something refreshingly new in the realm of experimental electricity and magnetism, then you should by all means study this excellent and clearly written explanation of these little known scientific phonomena.

ALTERNATING CURRENT: THEORY, PRACTISE AND DIAGRAMS, by Horstmann and Tousley. Cloth covers, 296 pages, 173 illustrations, size 6½ x 4½ inches. Price $1.00. Publisht by Frederick J. Drake & Company, Chicago, Ill.

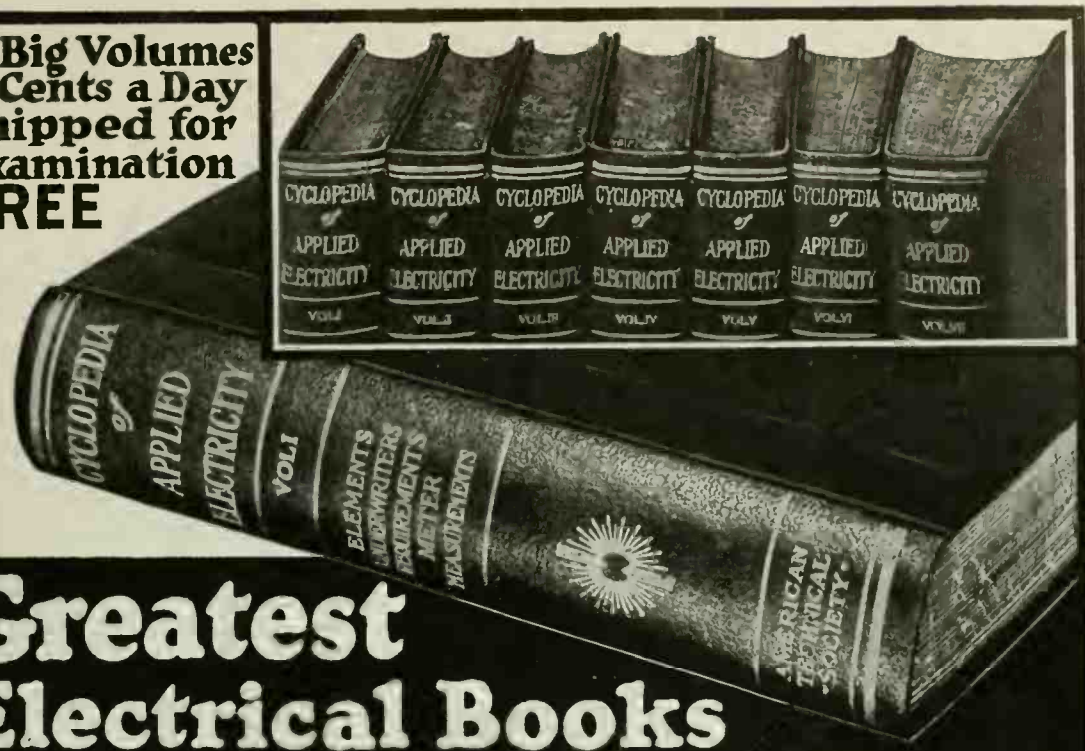
One of the well-known Horstmann and Tousley practical handbooks for electrical men, giving the theory and practice of this branch of electrical engineering so that the non-mathematical student can learn the exact meaning of the various terms used. The work starts with the generation of alternating currents and discusses inductance, capacity and resistance and their effect on the voltage and current in alternating current circuits. Next we find an interesting discussion on impedanee, wattless current, and skin effect.

Other interesting chapters treat on the calculation of power in A. C. circuits; transformers; the theory and construction of transformers and how they are connected in lighting and distribution circuits; alternating-current generators, their theory and construction; A. C. motors, including the synchronous motor and its characteristics; synchronous converters, their theoretical and practical operation; the split-pole and also inverted converters; A. C. to D. C. rectifiers of various types; including electrolytic and vibrating rectifiers; potential regulators; measuring instruments for A. C. work, including synchroscopes and power-factor meters, with numerous tables for the calculation of A. C. circuits for different frequencies and voltages. A clearly written handbook which explains in untechnical terms the principles and practise of alternating currents for the practical electrician and student.

GERMAN ENVOYS TOLD TO SURRENDER, VIA RADIO.

A wireless message sent to the German delegates from German headquarters authorized them to sign the armistice.

The German commissioners remained up all night waiting for final instructions. When the radio message arrived they hastened to a private train in which Marshal Foch was living, and which formed his headquarters. Marshal Foch was asleep at the time. He was aroused. He received formal word that the Germans had come to sign.



The first to affix his signature to the momentous document was Dr. Mathias Erzberger, civilian head of the commission. The other delegates followed.

As they signed, one by one, they saluted, Marshal Foch and his aide-de-camp responding courteously.

In the meantime, across the network of wires running from Marshal Foch's headquarters to the various battlefields, the order for cessation of hostilities at 11 o'clock, Nov. 11th, began to be flashed up and down the far-flung western front, while from Paris and London the news started on its joyous trip around the world.

7 Big Volumes 7 Cents a Day Shipped for Examination FREE

Greatest Electrical Books Now Brought to Your Home!

Partial Contents

Vol. I. *Elements of Electricity:* Magnets--Electromagnets. The Electric Current: Resistance--Underwriters Requirements--Power Stations and Equipments--Outside Wiring--High Tension--Special Installations--*Electrical Measurements:* Instruments--Measuring Methods: Resistance Insulation--Distribution Systems--Watt-Hour Meters: Construction, Installation, Testing.

Vol. II. *Dynamo Electric Machinery:* Magneto Electric Induction--Generators--Construction--Practical Design. *Types of Generators and Motors:* Direct and Alternating Generators and Motors. Motor Generators--Induction Motors.

Vol. III. *Direct Current Motors:* Efficiency--Torque--Speed--Power--Multi-Voltage Systems. *Management of Dynamos and Motors:* D. C. and A. C. Plants--*Lighting:* Incandescent Lamps--Tungsten Lamps--Nitrogen Filled and Mercury Vapor--Arc Lamps--Residence--Photometry.

Vol. IV. *Alternating Current Machinery:* Simple Alternator--Instruments--Polyphase Systems--Armature Windings--Transformers--Rectifiers--Motor Generators.

Vol. V. *Power Transmission:* Conductors--Distributing Systems--Voltage Regulation--Underground Construction--*Electric Railways:* Car Equipment--Maintenance--Power Plants--Signal Systems.

Vol. VI. *Power Stations:* Plant Location--Electrical Equipment--*Switchboards:* Wiring Diagrams of Connections--Switchboard Apparatus. *Storage Batteries:* Types--Charging and Discharging--Troubles and Remedies--Small Battery Installations. *Applied Electrochemistry:* Metal Refining and Plating--Chemicals--Electric Furnaces--High Tension Work.

Vol. VII. *Modern Land Telegraphy. Wireless Telegraphy and Telephony. Electric Elevators. Electric Heating. Welding.*

Note:--This is but a partial list of contents. The set contains every electrical subject known!

7 Big Volumes—Written by 27 Great Authorities—Yours for 7 Cents a Day

THE hardest way to learn Electricity is through your *own experience*. The *easiest* way to learn is through the experience that *others have paid for in time and money*. Here in practical, easy-to-understand form, you get the benefit of what *27 greatest electrical* authorities in America and all over the world have learned, and you get this vast fund of experience in convenient book form, so that you can read and study in your own home in your spare time.

This is the greatest opportunity of your life to become an electrical engineer, sub-station operator, dynamo tender, or to get any one of the other big-pay jobs in the electrical field. For less than you spend for tobacco or movies, you can train yourself to step up to the jobs paying $2,500 to $5,000 a year.

Shipped on Free Examination

No Money in Advance

Just glance at the partial list of contents of these 7 volumes in the panel at the left. Think how much there is for you in this great home-study library of electricity. Then write at once for the books themselves. Examine them in your own home for a week. Send them back if you are not satisfied. But if you decide to own this pay-raising set, send only $2 and then only $2 a month until the special half price is paid. Examine the books—see how they take you through every detail of each special branch of electricity. See how they give you all the necessary tables and formulas in simple, untechnical form. Note the frequent test questions which enable you to *examine yourself*. Note the 2,600 illustrations, full page plates, diagrams, etc. You be the judge of their value to you!

HALF PRICE—NOW

For a limited time we are offering this remarkable self instructor Electrical library at half price. Regular price $35—special price $19.80 on easy terms of only 7 cents a day. With each set we include a year's Consulting Service Membership free—worth $12. The 7 volumes contain 3,000 pages, each 7 x 10 inches, bound in American Morocco, Gold Stamped.

Mail Coupon—Send No Money

If you are interested in electricity you need these books. You will prize them for the new, up-to-date information they give you on every phase of electrical work. We ship the 7 volumes right to your home on your simple request. Send no money until you *are satisfied* after 7 days free examination. Put your name and address on the coupon now and send at once before this offer is withdrawn.

AMATEURS!
Get Ready for the Opening Day

Complete text books written by leading experts. Up-to-date, describing all 1918 apparatus and practices. These books furnish all information required to enter the wireless and aviation services. Written to prepare you for active service in the shortest possible time. In use at all army and navy schools and camps, universities, colleges and technical schools. Each book is a practical home study course covering the entire subject and giving information not to be found in any other sources.

Practical Wireless Telegraphy
By Elmer E. Bucher, Director of Instruction Marconi Institute

The recognized standard wireless text book. Treats each topic separately and completely, and furnishes a progressive study from first principles to expert practice. Covers completely the entire field of wireless (fundamentals, construction and practical operation). More than 50,000 copies of this book have already been sold. Size 6 x 9 inches. 352 pages. 340 illustrations. Handsomely bound in full cloth with cover stamping in gold and black. Price, $1.75 postpaid.

Radio Telephony
By Alfred N. Goldsmith, Ph.D. Director of Radio Laboratory, College of the City of New York

Written in clear style to appeal to even the beginner. Treats all aspects of Radio Telephony including a description of Radio Telephony in practice for a distance of more than five thousand miles. Covers the subject of construction and operation thoroughly and will be found an invaluable aid to men who seek to improve their position in the wireless profession. Size 6 x 9 inches, 256 pages. 226 illustrations. Handsomely bound in full cloth stamped in gold. Price, $2.00 postpaid.

Vacuum Tubes in Wireless Communications
By Elmer E. Bucher

An elementary text book for experimenters, students and operators. Gives complete description and makes clear every fundamental operating principle of the vacuum tube. Graphic diagrams reveal at a glance the various uses of the vacuum tube. The only text book on the market devoted solely to the various applications of the oscillation valve. Shows over one hundred different circuits. Size 6 x 9 inches: 130 diagrams and illustrations. Handsomely bound in cloth. Price, $1.75 postpaid.

Practical Aviation
Including Construction and Operation
By J. Andrew White

An invaluable book for intensive study by men preparing to become aviators. Gives the complete working knowledge required for actual flying and air combat. The subjects covered include operation and care of aviation engines, reconnaissance, map reading, signaling and operation with military bodies, radio and its uses, meteorology, and night flying. Size 6 x 9 inches: hundreds of illustrations. Bound in full cloth. Price $1.75 postpaid.

These Text Books Have Been Used in Training Over 60,000 Men During the Past Year

THE WIRELESS AGE
The only American magazine devoted exclusively to the wireless art. Records all developments in the scientific, experimental and commercial fields. A magazine that keeps you posted on all the latest doings and gives you a broader working knowledge of the art of wireless than possible through any other sources. Live, up-to-date and newsy feature articles with vivid illustrations and practical suggestions for red-blooded Americans. Practical training courses by experts on wireless telegraphy, aviation, military signaling, etc., in each issue. Go to the nearest news-stand and secure your copy, or, we will mail postpaid upon receipt of price. 20c per copy, $2.00 per year.

SPECIAL OFFER The Wireless Age for one year and your choice of Practical Wireless Telegraphy, Vacuum Tubes or Practical Aviation for $2.75 or Radio Telephony for $3.00. Save money and subscribe now.

WINTERTIME USES FOR THE ELECTRIC FAN.

(*Continued from page* 619)

be screwed down so as not to fall over and injure anyone.

Another illustration shows a very effective aid in the drying of milady's silk stockings, gloves and handkerchiefs. A funnel "B" can be easily constructed out of ordinary cardboard to fit the protective guard, and attached with wire. Or, it can be made a bit larger so as to slip a few inches over the protector, perforated at two or four places and tied at the back with string. Of course the width of the other end should be much narrower in order to produce the conical shape, as the sketch illustrates. A small piece of cardboard formed into a cylinder, and sewn or pasted together so as to exactly fit the end of the cone, is also fastened to it with wire. This is done by perforating both and sewing the wire from one hole to the other. The stocking is then slipt on and can be clamped down. (The clamps that are used on jam jars to make them air-tight would serve very nicely here.) Also small hooks made of wire (picture wire would do), invisible hairpins, etc., can be affixt to the end of the funnel, on which handkerchiefs, stockings and gloves can be fastened. In the latter case it is not necessary to make the small cardboard attachment. It is readily

To Improve the Cold Air Box Draft To Your Furnace, Install An Electric Fan In the Draft Passage After the Manner Illustrated. A "North" and "South" Cold Air Box, Fitted With Suitable Cut-Off Dampers, Makes a Very Dependable Furnace, No Matter Which Way the Wind Blows.

understood that the forced air thru this funnel dries the articles in no time. Should it be inconvenient for you to make this funnel, the handkerchiefs, stockings, et cetera, can be attached to the protector itself by pins or hairpins. With this method it will take slightly longer for them to dry. Care should be taken to attach the articles *before* you set the fan going. Take them off *after* you have *cut off* the current with the snap switch and the fan has fully stopt. *This precaution should be taken whenever the electric fan is handled in any way.*

Figure "B" shows a handy device that can quickly be affixt to or taken off the guard. A circle of tin is cut in the manner illustrated, allowance being made for small projections which are bent over and formed into hooks. It can be affixt to the protector guard with the projecting tabs. If the tin is not handy, cardboard will do just as well, except that the hooks must be made of wire or old hairpins. A good way to make these hooks is to thrust the hairpin thru the perforation, the two ends first, twisting them around at the other side of the perforation and then spreading them apart. About four cardboard tubes are inserted and sewn with wire as aforementioned to a piece of cardboard large enough to fit the wire cage pro-

www.americanradiohistory.com

tector or guard, to which it is in turn fastened. The use of hooks or rubber bands is also made here in securing the articles to the tubes.

Another use to which the electric fan can be put is the drying of photo negatives. The draft of air from the fan causes the water on the negative to evaporate, so that they will dry much sooner than under the ordinary process, which is to spread them on racks and allow them to dry by themselves. It proves of great help to the amateur as well as the commercial photographer, who particularly should make use of this method when business is rushed, or certain pictures are in special demand.

Nothing, perhaps, is more exasperating than to enter a public telephone booth and having to breathe the suffocating air, which is many times laden with the odor of stale tobacco. The electric fan might well be employed in all such instances.

Have you ever tried to look thru the window of a bakery or lunch room covered with frost, and dimly make out a few of the many delicacies therein? After the windows have been cleaned till they shine like mirrors, and a great deal of effort been expended to make the articles for sale most appealing, along comes Jack Frost and spoils it all. Some store-keepers have tried filling the window with warm air, but this is rather bothersome and expensive, as the cold window-pane cools it and a fresh supply of warm air must be employed. The most effective, least troublesome, and in the end the cheapest way, is—the electric fan. It circulates the air evenly, thus keeping a fixt temperature, with the result that no frost will form on the window.

One of the accompanying illustrations shows a very good use for an electric fan in the wintertime to help out the *cold air* circulating system to hot-air and other furnances. This suggestion was made by one of the Westinghouse engineers, and the sketch shows clearly how the fan is placed directly in the cold air duct. The fan may be placed anywhere in the duct, its function being to create a very strong draft or suction so as to act firstly as a forced draft for the furnace, and also to draw in a sufficient quantity of fresh air at all times thru the inlet in the cellar wall. Especially is this suggestion of value when the wind or air currents blow from the opposite side of the house in which the cold air intake is situated. In wiring up and installing such a fan arrangement, it is best to connect a small 4 c.p. pilot lamp on the motor side of the switch as a reminder to the furnace tender that the fan is operating, for it is not necessary to keep it going except at certain intervals, as for instance when a house is very cold or when the wind is blowing on the opposite side of the house.

A very good idea in this direction is to provide a two-way cold air box; one inlet being located in the *north* wall and the other in the *south* wall of the house. Suitable dampers should be used of course to cut off one or the other as the case may be, so that when the wind blows from the *north*, as the arrows show, then cold air can be taken from this inlet; while when the wind blows from the *south*, the cold air intake from that direction can be utilized by closing the north damper and opening the south damper. Great care must be taken in every instance to keep the cold air duct thoroly air-tight thruout its entire length, and it is often best to have a plumber or furnace man install the fan if you are not familiar with the work, as you may easily leave openings in the duct, thus creating a false draft and losing as much or more than what you at first set out to gain. Hot-air furnaces are widely used, but in some cases do not operate satisfactorily for sev-

How it Feels to Earn $1000 a Week

By a Young Man Who Four Years Ago Drew a $25 a Week Salary. Tells How He Accomplished It.

How does it feel to earn $1000 a week? How does it feel to have earned $200,000 in four years? How does it feel to be free from money worries? How does it feel to have everything one can want? These are questions I shall answer for the benefit of my reader out of my own personal experience. And I shall try to explain, simply and clearly the secret of what my friends call my phenomenal success.

Let me begin four years ago. At that time my wife and I and our two babies were living on my earnings of twenty-five dollars a week. We occupied a tiny flat, wore the simplest clothes, had to be satisfied with the cheapest entertainment—and dreamed sweet dreams of the time when I should be earning fifty dollars a week. That was the limit of my ambition. Indeed, it seemed to be the limit of my possibilities. For I was but an average man, without influential friends, without a liberal education, without a dominating personality, and without money.

With nothing to begin with, I have become the sole owner of a business which has paid me over $200,000 in clear profits during the past four years and which now pays me more than a thousand dollars a week. I did not gamble. I did not make my money in Wall Street. My business is not a war baby—on the contrary, many others in my line have failed since the war began.

In four years, the entire scheme of my life has changed. Instead of living in a two by four flat, we occupy our own home, built for us at a cost of over $60,000. We have three automobiles. Our children go to private schools. We have everything we want, and we want the best of everything. Instead of dreaming of fifty dollars a week I am dreaming in terms of a million dollars—with greater possibilities of my dream coming true than my former dream of earning fifty dollars a week.

What brought about this remarkable change? What transformed me, almost overnight, from a slow-going, easily-satisfied, average man—into a positive, quick-acting, determined individual who admits no defeat, who overcomes every obstacle and who completely dominates every situation? It all began with a question my wife asked me one evening after reading an article in a magazine about a great engineer who was said to earn a $50,000 salary.

"How do you suppose it feels to earn $1000 a week?" she asked. And without thinking, I replied "I haven't the slightest idea, my dear, so the only way to find out is to *earn it.*" We both laughed, and soon the question was apparently forgotten.

But that night, and for weeks afterward, the same question *and my reply* kept popping into my brain. I began to analyze the qualities of the successful men in our town. What is it that enables them to get everything they want? They are not better educated than I—indeed, some are far less intelligent. But they must have possessed some quality that I lacked. Perhaps it was their mental attitude; perhaps they look at things from an entirely different angle than I. Whatever it was, that "something" was the secret of their success. It was the one thing that placed them head and shoulders above me in money-earning ability. In all other ways we were the same.

Determined to find out what that vital spark of success was, I bought books on every subject that pertained to the mind. I followed one idea after another. But I didn't seem to get anywhere. Finally, when almost discouraged, I came across a copy of "Power of Will." Like a bolt out of a clear sky there flashed in my brain the secret I had been seeking. There was the real, fundamental principle of all success—Power of Will. There was the brain faculty I lacked, and which every successful man possesses.

"Power of Will" was written by Prof. Frank Channing Haddock, a scientist, whose name ranks with such leaders of thought as James, Bergson and Royce. After twenty years of research and study, he had completed the most thorough and constructive study of will power ever made. I was astonished to read his statement that, "The will is just as susceptible of development as the muscles of the body!" And Dr. Haddock had actually set down the very rules, lessons and exercises by which anyone could develop the will, making it a bigger, stronger force each day, simply through an easy, progressive course of training.

It is almost needless to say that I at once began to practice the exercises formulated by Dr. Haddock. And I need not recount the extraordinary results that I obtained almost from the first day. Shortly after that, I took hold of a business that for twelve years had been losing money. I started with $300 of borrowed capital. During my first year I made $30,000. My second year paid me $50,000. My third year netted me $70,000. Last year, due to increased costs of materials, my profits were only $50,000, though my volume of business increased. New plans which I am forcing through, will bring my profits for the present fiscal year up to $65,000.

Earning a thousand dollars a week makes me feel secure against want. It gives me the money with which to buy whatever will make my family happy. It enables me to take a chance on an investment that looks good, without worrying about losing the money. It frees my mind of financial worries. It has made me healthier, more contended, and keener minded. It is the greatest recipe I know for happiness.

Prof. Haddock's lessons, rules and exercises in will training have recently been compiled and published in book form by the Pelton Publishing Co., of Meriden, Conn. I am authorized to say that any reader who cares to examine the book may do so without sending any money in advance. In other words, if after five days' reading, you do not feel that the book is worth $3, the sum asked, return it and you will owe nothing. When you receive your copy for examination I suggest that you first read the articles on the law of great thinkiog; how to develop analytical power; how to perfectly concentrate on any subject; how to guard against errors in thought; how to drive from the mind unwelcome thoughts; how to develop fearlessness; how to use the mind in sickness; how to acquire a dominating personality.

Never before have business men and women needed this help so badly as in these trying times. Hundreds of real and imaginary obstacles confront us every day, and only those who are masters of themselves and who hold their heads up, will succeed. "Power of Will" as never before, is an absolute necessity—an investment in self-culture which no one can afford to deny himself.

Some few doubters will scoff at the idea of will power being the fountainhead of wealth, position and everything we are striving for. But the great mass of intelligent men and women will at least investigate for themselves by sending for the book at the publisher's risk. I am sure that any book that has done for me—and for thousands of others—what "Power of Will" has done—is well worth investigating. It is interesting to note that among the 250,000 owners of "Power of Will" are such prominent men as Supreme Court Justice Parker; Wu Ting Fang, Ex-U. S. Chinese Ambassador; Lieut.-Gov. McKelvie, of Nebraska; Assistant Postmaster General Britt; General Manager Christeson, of Wells-Fargo Express Co.; E. St. Elmo Lewis; Governor Arthur Capper of Kaosas, and thousands of others. In fact, today "Power of Will" is just as important and as necessary to a man's or woman's equipment for success, as a dictionary. To try to succeed without "Power of Will" is like trying to do business without a telephone.

As your first step in will training, I suggest immediate action in this matter before you. It is not even necessary to write a letter. Use the form below, if you prefer, addressing it to the Pelton Publishing Company, Wilcox Block, Meriden, Conn., and the book will come by return mail. This one act may mean the turning point of your life, as it has meant to me and to so many others.

The cost of paper, printing and binding has almost doubled during the past three years, in spite of which "Power of Will" has not been increased in price. The publisher feels that so great a work should be kept as low-priced as possible, but in view of the enormous increase in the cost of every manufacturing item, the present edition will be the last sold at the present price. The next edition will cost more. I urge you to send in the coupon now.

PELTON PUBLISHING COMPANY

30-A Wilcox Block, Meriden, Conn.

I will examine a copy of "Power of Will" at your risk. I agree to remit $3 or remail the Book in 5 days.

The Gift of Gifts

FOR THOSE WHO LOVE GOOD MUSIC

THE ELLIS "MUSIC MASTER" REPRODUCER

is the ideal Christmas gift for anyone who owns a phonograph or talking machine using disc records. This wonderful little reproducer bears the same relation to the reproduction of records as does Stradivarius to the making of violins. Both are masters.

There is as much difference in the effect of the Ellis Reproducer and ordinary reproducers, as there is between a genuine Stradivarius and a cheap factory made violin. As one user said: "Mr. Ellis, your reproducer is soulful and inspiring. The overtones are remarkable and wonderful, and the tone shading very beautiful."

Ordinary reproducers, such as are supplied with all phonographs or talking machines, give a harsh, rasping, annoying sound and reproduce the human voice with a disagreeable nasal twang. The Ellis Music Master makes every note and tone as clear as a bell—and reproduces it in its true tone coloring. It is a marvelous little instrument that will please anyone who appreciates and can comprehend the difference between good and indifferent rendition of music. It is truly a "Music Master."

The Ellis "Music Master" is made for all machines using disc records. It is lighter than ordinary reproducers, therefore preserves and prolongs the life of records. The cost is little, but the satisfaction great.

Write today for circular E, which gives full details.

J. H. ELLIS, P. O. Box 882, Milwaukee, Wis.

Wireless Stations Will Shortly Re-open

Date, only, uncertain

Heed Our Advice *ORDER NOW*

As a matter of law Congress loses all control over wireless receiving stations and transmitting stations with a range within the borders of the state where located as soon as peace is declared. The Radio Inspector of this district has already asked our co-operation in printing in the next edition of our catalog the necessity of securing licenses for transmitting sets with a range beyond the borders of the state. No wireless manufacturer wants the stations to open tomorrow. They could not take care of the business. Order now and be prepared. We have a big stock of wireless instruments.

No. 11 is our latest catalog. No new price list.

Please do not write for catalog if you have No. 11. Paper costs three times as much as formerly. Let the amateur without a catalog secure one. Write for prices in advance. Just now we have no price list, because the changes have been so frequent. Will advise through this magazine when revised price list is ready, which will be as quickly as possible.

Send 8c in coin or stamps today for our big 300 page No. 11 Electrical and Wireless Catalog. Any wireless amateur will tell you it is the one catalog to have. You need no others. Our catalog contains most everything in wireless worth while, and is a guarantee that the goods are dependable.

THE WILLIAM B. DUCK CO., 230-232 Superior St., Toledo, Ohio

He Learned K·I· Shorthand in 5 evenings —You can!

AVAUGHN M. AMES, the young man in the picture, did it. So have legions of others. We guarantee you can learn the entire system in five evenings; than acquire speed. Become proficient in a tenth of the time it would take you with any of the old, complex systems. K. I. Shorthand is the new simplified stenography that experts consider the most concise and most legible shorthand in the world. Learn by mail.

Why go through months of drudgery and spend ten times as much money learning some troublesome system? K. I. students are found in every walk of life—among doctors, lawyers, teachers, electricians, engineers, and business-men, as well as stenographers and secretaries. Used in army and navy, and acknowledged by progressive commercial schools as the most practical of shorthand systems.

30 Days Approval K. I. Shorthand will be a big help to you in any vocation. You can afford to learn it because it is so easy and costs so little. Don't think K. I. Shorthand is meant only for stenographers. Learn this invaluable system so you can be more than a stenographer. It conserves your time, does your remembering for you. Hence promotes your efficiency and puts you in line for more rapid advancement. Valuable in your electrical or mechanical enterprises.

We teach you the entire course on approval for 30 days with the understanding that you need not pay one cent if you do not learn. Prove it for yourself by receiving two first lessons FREE.

More Than a Text Book! Do not compare our system with offers of text books on stenography. We give you personal mail tuition. Experts guide you in acquiring proficiency and accuracy in the shortest time. Free Lessons, testimonials and complete information sent on request.

KING INSTITUTE, Inc. Station F, (EH-300), New York, N. Y. or 2 S. Wabash Av., (EH-300), Chicago, Ill.

eral reasons. Among these are insufficient area of the cold air duct; furnace not located low enough in cellar bottom; or else hot air pipes rise at too low an angle. These should rise at a sharp angle, preferably not less than 45 degrees at the top of the furnace, and will always work better when kept close to this angle or approaching the vertical, than they will in the horizontal direction. In the majority of cases it is usually found that the wind blows from the north or some northerly direction more than any other. Therefore, where but one fan is available for this use, it should be installed in the *north* cold air box.

A large and airy but unfinished attic room in a building occupied by a school was suddenly needed in order to accommodate an extra class. It took only a few days to wire and plaster it but the time required for natural drying could not be spared and use of the common salamanders was inadvisable because of fire hazard. Three 16-inch electric fans were placed on boxes and turned so as to keep a continual circulation of air thruout the room. With windows poen and the fans running for a day and night, the fresh plaster dried quickly so that carpenters and decorators could finish the room shortly.

2 MEN MILE APART BURNED BY SAME ELECTRIC FLASH.

Recently two men, R. C. Deyo and Henry Nisson, both in the employ of the San Joaquin (Cal.) Light and Power Company, were working on the top of telephone poles for the company, 50 miles apart, when an unaccountable and unknown current of 10,000 volts went flashing over the wires and gave each man such a shock that it is a miracle that they escaped instant death. Both men were similarly burned about the hands, both were rendered unconscious, and only restored to consciousness by extraordinary efforts. The men are now recovering from burned hands and the electric shock at the San Joaquin hospital.

Deyo was at work on the top of a telephone pole about twenty miles west of Bakersfield, Cal. He was busy on what the electricians call the 60-phone line, when a shock came to him. He fell to the ground, a distance of 25 feet.

When, after an hour, Deyo came to his senses, he was put in an automobile and hurried to the San Joaquin hospital in this city. Dr. N. J. Brown was called for attendance. Both of Deyo's hands are burned to a crisp at the palms, and he is suffering from hurts he received in his fall from the top of the telephone pole.

At the same moment Henry Nisson, aged 28 years, was engaged in exactly the same sort of work for the San Joaquin Light and Power Company at Pond. He, also, was at the top of a telephone pole, and he was served the same as Mr. Deyo. He fell unconscious, and his companion rushed to Dr. Copeland's office for help. His hurts are the same as Mr. Deyo's, only he has not the bruises by the fall.

GAS VERSUS ELECTRIC RANGE.

The gas range is little better than half as efficient as the electric range. Recent tests show that the top surface of the electric range requires but 64 per cent of the energy necessary to do the same work on the top surface of the gas range. The electric range oven requires but 23 per cent of the energy necessary for the same work in a gas range oven. The electric range oven is much more efficient in proportion than the top surface as compared with the oven and top surface of the gas range. Under actual household conditions the electric range requires about 55 per cent of the energy used by the gas range to do the same work.

www.americanradiohistory.com

NIKOLA TESLA AND HIS INVENTIONS.

(*Continued from page* 615)

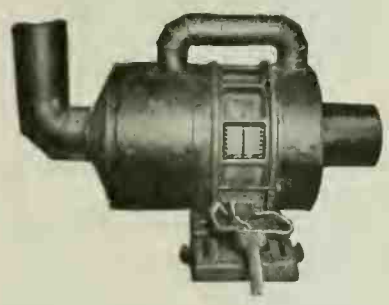
either a dreamer or, worse yet, crazy. The fact is the world does not understand you because you live in the next century. Moses was a great man, but the Bible teaches us that he was "heavy of tongue" and could not make himself understood. His brother therefore always spoke in his stead, announcing to his hearers what Moses had to say. Why not let the EXPERIMENTER be your brother? Why not let us translate your work into a language that the man in the street can readily understand? We have the knowledge and the technical training to do your inventions justice by means of graphic illustrations and wash drawings. The public does not want patent drawings or patent language. It wants pictures and plain English. You are a great inventor, but your 21st Century training prevents you from making yourself understood to a 20th Century public. My plan is to run one of your inventions every month, in plain English fully illustrated. That means that it will probably take over two years to deal with all of your more important inventions. At the end of this period the articles can be published in book form, a thing that does not exist at present. The plan is twofold. First, the world at large will at last understand the highly important work you have accomplished and will fully recognize you. Second, it will be of greatest benefit to Science, to whom your inventions will then not be the sealed book they are today."

Knowing that Tesla had in the past continuously refused similar offers of dozens of great publishers of this country as well as abroad, I was not at all sanguine of my own plan. Great was my surprise therefore, that he not only gave his consent, but he actually agreed to prepare each article personally with the Editors' collaboration.

Dr. Tesla wants it expressly understood that he is undertaking this great work chiefly to educate the young generation. He felt that he could not possibly reach such a large electrically trained young manhood, save thru the medium of the ELECTRICAL EXPERIMENTER. With its circulation above 100,000, all enthusiastic experimenters, Tesla feels that his greatest mission in life, namely, to assist our rising generation, will come near fulfillment.

Nikola Tesla's articles will therefore run serially every month in the ELECTRICAL EXPERIMENTER. The articles will be entitled: "My Inventions" —by Nikola Tesla. Every article will be entirely original; each will be illustrated with our own new illustrations and with such wash drawings as made this journal so successful. The first article will appear in our February number.

We wish to congratulate EXPERIMENTER readers for having obtained for them probably the greatest technical news feature of a generation. I caution you: *Expect much!*



FARMERS AND ELECTRICITY.

Within the past three years the farmers of the United States have purchased one million automobiles and 100,000 tractors and innumerable pumping engines, and other devices run by electricity, according to widely publisht estimates. Farmers everywhere are rapidly advancing in the same direction, progress in labor-saving contrivances being phenomenal in this country. A motor does the churning; a motor runs the sewing machine and the washing machine. The rural telephone is invading country districts at the rate of many miles per day, and all farm machinery is being operated by the aid of tractors, which now haul the wagon and work the hay loader in the hay field. Next year, it is said, reapers and mowers in great numbers will be drawn by tractors.

DEVICE FOR PROTECTING ELECTRIC MOTORS.

A motor protection system which, it is claimed, does away with the trouble and expense of cleaning motors, has been devised and marketed. The usual type of installation, it is pointed out, in working out this system consists of casings which enclose each end of the motor and make it dust proof. A fan is attached to the end of the motor shaft, a dust separator, and an air intake pipe running to a clean air supply out of doors. When the motor is started, the fan draws in the cool, fresh air thru the dust separator and forces it against the rear end of the motor, thru the windings and out thru the laminations. Part of the air is forced thru a by-pass to the front hood so that the same action takes place on both sides of the motor.

As a result, it is pointed out that the motor is kept clean and has a large volume of cool, clean air constantly passing thru it which carries away the heat as fast as generated. Motor casings are provided with

Forced Air Cooling Apparatus Shown Installed on a Motor.

large doors to permit of a ready inspection of brushes, resistance, air-gap, bearings, and the like. The dust separator is also provided with doors so that the screens can be readily removed. The equipment can be applied to motors without moving them and requires a short time to install. Besides reducing the temperature and increasing the efficiency, the maker points out that the protection provided allows the carrying of a large overload without shortening the life of the motor and eliminates fire hazards.

DANIELS TELLS OF FOE RADIOS SCOUTS FOUND.

A telegram from Secretary of the Navy Daniels received by the Boy Scouts of America characterized them as "chivalrous young crusaders" because of their work during the war. It also disclosed that the Scouts, working on behalf of the Government, had discovered hundreds of illegal wireless plants.

Twenty-six of these plants were found in one day. A German alien, operating an underground radio station with a small New England river supplying the motive power, was taken into custody and interned. This plant was said to have been exchanging German Government messages between America and Berlin. Details of these scout activities are expected to be made public later.

"I Can Succeed!"

"What other men have done with the help of the International Correspondence Schools, I can do. If the I. C. S. have raised the salaries of other men, they can raise mine. If they have helped others to advance, they can help me. To me, I. C. S. means 'I CAN SUCCEED.'"

Make up your mind right now that not another day shall pass until you have made *your* start toward success.

For 27 years men in offices, stores, shops, factories, mines, railroads, and in the Army and Navy have been winning promotion and increased salaries through the I. C. S. More than 100,000 men and women are getting ready *right now* with I. C. S. help for the bigger jobs ahead.

No matter where you live, the I. C. S. will come to you. No matter what your handicaps, or how small your means, we have a plan to meet your circumstances. No matter what career you may choose, some one of the 280 I. C. S. Courses will surely suit your needs.

When everything has been made easy for you—when one hour a day spent with the I. C. S. in the quiet of your own home will bring you a bigger income, more comforts, more pleasures, all that success means—can you let another single priceless hour of spare time go to waste? Make your start right now! This is all we ask: Without cost, without obligating yourself in any way, put it up to us to prove how we can help you. Just mark and mail this coupon.

"THE SET UNCLE SAM USES"

"Uncle Sam" needs thousands of operators and is calling for more all the time. Here is your chance to become an expert telegrapher at a small cost. The practice outfit shown here is exactly the same as used by the United States Signal Corps and comprises the following:

A highly polished mahogany finished wood base, a real high frequency buzzer giving a high note, with nickel-plated case, regulation nickel-plated steel lever key. Also brass etched plate showing the three international codes mounted on the base for quick practice. A new feature not found on any other set. You simply cannot mislay this code.

This outfit quickly gives you speed, and enables you to learn telegraphy, Morse or wireless code in a short time. Special attention is called to the buzzer which gives a clear high note, not a rattling noise as many inferior outfits now on the market. IMMEDIATE DELIVERY. We ship the same day that order is received. Your money refunded if you are not satisfied.

Price as illustrated. Shipping weight 2 lbs. Size over all 6"x2"x1¼". **$2.80** Includes sufficient postage for mailing. Send for free illustrated folder.

THE TEWNO CO. 150 CHAMBERS ST., NEW YORK

The Breakers

Atlantic City's Newest Fire-Proof Hotel

Ocean Front. Unusually attractive during the Autumn and Winter seasons.

American and European Plans

Luxurious lobbies, spacious verandas and sun parlors overlooking the ocean. Charming afternoon musicales and evening concerts. A palatial residence for those seeking rest and recreation. Sea water baths. Fireproof garage. Illustrated booklet sent on request.

MAGNETIC RECTIFIER
Patented April 18, 1916

YOUR lights will shine and sparkle with delight, your horn will squawk raucously and your engine will turnover enthusiastically if you play godfather to your starting and lighting battery by giving it an

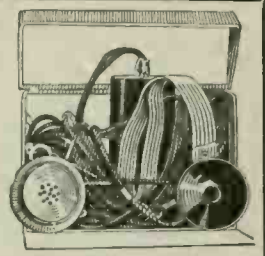
F-F BATTERY BOOSTER

A few minutes of your time once a month or so will rejuvenate your battery and prolong indefinitely its working life.

Write today for bulletin No. 12 and obtain a prescription for this battery panacea.

The France Manufacturing Company
10325 Beren Road, Cleveland, O.

Super-Sensitive Microphone Only $7.50



This instrument is offered at an extremely low price. It is excellent for building your own radio amplifier. Can also be used in many experiments where a sensitive microphone is required.

DETECTAGRAPH $15

This detecting instrument of marvelous sensitivity can be used for detecting secret conversations. Outfit consists of Sensitive Transmitter, 25 ft. Black Cord, Receiver, Headband, Case and Battery.

Send for One Today and Convince Yourself

DEAFNESS IS MISERY

I know because I was Deaf and had Head Noises for over 30 years. My invisible Anti-septic Ear Drums restored my hearing and stopped Head Noises, and will do it for you. They are Tiny Megaphones. Cannot be seen when worn. Easy to put in, easy to take out. Are "Unseen Comforts." Inexpensive. Write for Booklet and my sworn statement of how I recovered my hearing. A. O. LEONARD
Suite 369 70 5th Ave., N. Y. City

THE EFFECT OF STATICS ON WIRELESS TRANSMISSION.

(*Continued from page 627*)

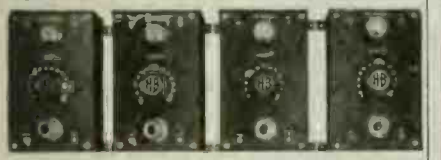
energy received, even if it could be collected in its totality, is infinitesimal and would not actuate the most sensitive instrument known were it magnified many million times. The fact is these waves have no perceptible influence on a receiver if situated at a much smaller distance. It should be remembered, moreover, that since the first attempts the wave lengths have been increased until those advocated by me were adopted, in which this form of radiation has been reduced to one-hillionth.

When a circuit, connected to ground and to an elevated capacity oscillates, two effects separate and distinct are produced; Hertz waves are radiated in a direction at right angles to the axis of symmetry of the conductor, *and simultaneously a current is passed through the earth.* The former propagates with the speed of light, the latter with a velocity proportionate to the cosecant of an angle which from the origin to the opposite point of the globe varies from zero to 180°. Expressed in words, at the start the speed is infinite and diminishes, first rapidly and then slowly until a quadrant is traversed when the current proceeds with the speed of light. From that region on the velocity gradually increases, becoming infinite at the opposite point of the globe. In a patent granted to me in April, 1905, I have summed up this law of propagation in the statement that the projections of all half waves on the axis of symmetry of movement are equal, which means that the successive half waves, tho of different length, cover exactly the same area. In the near future many wonderful results will be obtained by taking advantage of this fact.

There is a vast difference between these two forms of wave movement in their bearing on the transmission. The Hertz waves represent energy which is radiated and unrecoverable. The current energy, on the other hand, is preserved and can be recovered theoretically, at least, in its entirety. If the experts will free themselves from the illusions under which they are laboring, they will find that to overcome static disturbances all that is needed is a properly constructed transmitter and receiver without any additional devices or preventives. I have, however, devised several forms of apparatus eliminating statics even in the present defective wireless installations in which they are magnified many times. Such a form of instrument which I have used successfully is shown in the annexed photograph. These phenomena have been studied by me for a number of years and I have found that there are nine or ten different causes tending to intensify them, and in due course, I shall give a full description of the various improvements I have made, in the ELECTRICAL EXPERIMENTER. For the present I would only point out that in order to perfectly eliminate the static interference, it is indispensable to redesign the whole wireless apparatus as now employed. The sooner this is understood the better it will be for the further evolution of the Art.

A means of making use of the electric magnet under water has been devised in Japan, and it promises to be of great assistance in locating sunken vessels, to recover which salvage operations on a big scale are expected after the war.

With the aid of special oxygen masks airplane experts believe that air fighters will be able to carry on battles five miles above the earth.



www.americanradiohistory.com

NEW BATTERY CHARGER SIMPLICITY ITSELF.

For the Garage Man going into Battery or Service work on an ample scale, or for the Garage that has outgrown its present equipment, an Ohio concern has brought out a new 32 battery capacity Charging Outfit shown herewith.

With this outfit batteries in all stages of charge can be handled by the four charging lines provided, caring for eight batteries in each line. Batteries requiring different charging rates can be handled according to their individual needs, due to the ample output of the machine. Different voltage batteries can also be charged in the same line, due to the automatic voltage control of the Generator.

With this outfit, battery charging work is claimed to be very profitable, and the makers state they have designed the outfit wholly with the idea of bringing the Garage the largest profits possible from this class of work.

Compact Battery Charging Outfit of capacity Ample for Average Public Garage and Service Station.

DO YOU ASSOCIATE COLORS WITH FIGURES?

The recent letter to *Science* from David Starr Jordan called to my attention a fact which I did not know before, says Arthur Bessey Smith, the well-known telephone engineer, in that journal. On mentioning it to my laboratory assistant, Mr. Herbert Edward Clapham, he said that he, too, associated colors with the letters of the alphabet, but not with all, and that figures were also associated with colors. At my request he wrote out the following list:

A gray	O black	1 white
B light red	P brown	2 red
C black	Q ———	3 light red
D pink	R ———	4 gray
E scarlet	S white	5 white
F pink	T red	6 white
G ———	U golden brown	7 golden
H yellow	V gray	8 brown
I white	W ———	9 red
J white	X ———	0 black
K ———	Y white	
L ———	Z red	
M olive green		
N olive green		

Altho I have never associated colors with letters or figures, from my earliest recollection I have always thought of letters and of figures arranged in certain relative positions. The origin of this I do not know. It might have been something in the presentation of these things by my first teacher, or the manner in which little wooden sticks were laid out on my desk in the first number work. These little sticks, each about 3 mm. in diameter and 20 mm. long, had been split out of pine for me by my father.

WANTED!

OFFICE MEN
Auditors, Accountants, Office Managers, Credit Men, Cashiers, Bookkeepers and Cost Clerks—$1,200 to $7,500.

FACTORY MEN
Electrical and Mechanical Engineers, Factory Managers, Superintendents, Foremen, Designers, Draftsmen—$1,500 to $12,000.

CONSTRUCTION MEN
Civil and Structural Engineers, Transitmen, Construction Superintendents and Foremen, Estimators, Designers and Draftsmen—$1,200 to $10,000.

TRADES—Machinists and Toolmakers, Auto Repairers, Electricians, Stationary Engineers, Firemen, Plumbers, Carpenters, etc.—$1,200 to $2,000.

All these positions were advertised in a single issue of a Chicago newspaper

Which Job Can You Fill?

Which one of them could *you* fill? If you haven't the knowledge necessary to break into the *big-pay class*, decide to *get that knowledge NOW!* Any of the books listed below will quickly fit you for a well-paid job—at home—in your spare time.

These books were written by experts in plain, everyday language. They are free from puzzling technical terms. Numerous illustrations, diagrams and tables make difficult points as simple as A-B-C. They are handsomely bound in half or full leather (except Law and Practice, which is bound in law buckram) and stamped in gold. Fill out the coupon.

Carpentry and Contracting
Five volumes, 2138 pages and more than 400 illustrations. Prepares for Contractor, Building Superintendent and Carpenter Foreman. Regular price, $25.00. Special price, $17.80.

Civil Engineering
Nine volumes, 3900 pages and 3000 illustrations, plates and diagrams. Prepares for Civil or Structural Engineer, Transitman, Estimator, Designer or Chief Draftsman. Regular price, $45.00. Special price, $29.80.

Telephony and Telegraphy
Four volumes, 1728 pages and 2000 illustrations, plates and diagrams. Prepares for Telephone Engineer, Wire Chief, Exchange Manager, Trouble Man or Telegrapher. Regular price, $20.00. Special price, $12.80.

Fire Prevention and Insurance
Four volumes, 1500 pages and 600 illustrations, diagrams, forms, etc. Prepares for Counterman, Rata Clerk, Inspector or Agent. Regular price, $20.00. Special price, $15.80.

Electrical Engineering
Seven volumes 3000 pages and 2600 illustrations, plates and diagrams. Prepares for Electrical Engineer, Power Plant Superintendent, Substation Operator or Electrician. Regular price, $35.00. Special price, $19.80.

Accountancy and Business Management
Ten volumes, 3680 pages and 1987 illustrations, forms, etc. Prepares for Certified Public Accountant, Auditor, Office Manager, Accountant, Credit Man or Bookkeeper. Regular price, $50.00. Special price, $24.80.

Automobile Engineering
Five volumes, 2100 pages and 2000 illustrations. Prepares for Garage Foreman, Automobile Mechanic or Chauffeur. Invaluable to car owners. Regular price, $25.00. Special price, $17.80.

Steam and Gas Engineering
Seven volumes, 3300 pages and 2500 illustrations, plates, diagrams, etc. Prepares for Stationary, Marine or Locomotive Engineer or Fireman. Regular price, $35.00. Special price, $21.80.

MachineShop Practice
Six volumes, 2300 pages and 2500 illustrations. Prepares for Machine Shop Superintendent or Foreman, Foundryman, Pattern Maker, Tool Designer or Tool Maker. Regular price, $30.00. Special price, $19.80.

Law and Practice
(with Reading Course in 25 bound pamphlets). Thirteen volumes, 6000 pages and 24 illustrations. Prepares for all Bar Examinations. A wonderful aid to business men. Regular price, $72.00. Special price, $39.80.

Sanitary, Heating and Ventilating Engin'ring
Four volumes, 1454 pages and more than 1400 illustrations, etc. Prepares for Sanitary Engineer, Heating and Ventilating Engineer, Master Plumber or Plumber. Regular price, $20.00. Special price, $13.80.

Practical Accounting
Four volumes, 1840 pages and 800 illustrations, plates and diagrams. C. P. A. questions and practical problems. Prepares for Accountant, Bookkeeper or Cost Clerk. Regular price, $20.00. Special price, $12.80.

One Week Free Trial

We'll gladly send you any set for seven days' examination. Don't send us a penny; just pay the small shipping charge when the books arrive. Examine them carefully—use them at your work for an entire week. At the end of that time, if you feel they aren't worth far more than we ask, return them *at our expense*. If you keep them, pay the bargain price on the easy terms explained below.

American Technical Society
Dept. X3389 Chicago, U. S. A.

50c A WEEK

Yes, if you decide to keep the set you have selected, send $2 within seven days and then $2 a month (*50c a week*) until the present low price has been paid. Have you ever heard of a more generous offer? Remember, you take no chances whatever—we send the books for examination and you are not obliged to keep them if you do not care to buy. Mail the coupon *now*—before you turn the page.

American Technical Society, Dept. X3389, Chicago, Ill.

Please send me set of ..... for 7 days' examination, shipping charges collect. I will examine the books thoroughly and, if satisfied, will send $2 within 7 days and $2 each month until I have paid the special price of ..... If I decide not to keep the books, I will return them by express at your expense. Title not to pass to me until the set is fully paid for.

Do you know how to test flour?
Do you know how Chlorine Smoke and Chlorine Gas (German War Gas), is made?
What do you know about chemistry in general?

These and hundred other interesting questions are answered and demonstrated with our Chemistry Laboratory which we present herewith.

CHEMISTRY!

We present herewith to our friends our new E. I. Co. Chemical Laboratory which contains real chemicals and apparata to perform real chemical experiments. This outfit is not a toy, put up merely to amuse, but a practical laboratory set, with all the chemicals, apparata and reagents necessary to perform real work and to teach the beginner all the secrets of inorganic chemistry. With this outfit we give free a book containing a Treatise in Elementary Chemistry, useful data and recipes, and 100 instructive and amusing experiments.

44 Chemicals
17 Apparata
1 Instruction Book with 100 Experiments

PRICE $5.00

Shipping Weight 10 lbs

CAN BE SHIPPED BY EXPRESS ONLY

The chemicals furnished are all technically pure and put up in appropriate wooden boxes and glass bottles, and there is a sufficient quantity to make dozens of experiments with each. The apparata are of standard laboratory size and quality.

Altho all chemicals have nearly doubled in price, we have decided not to raise the price for this outfit for the present.

Read the list of chemicals and apparata and look at the actual photograph of the outfit at your right.

And order one today!

THE E. I. Co. CHEMICAL LABORATORY

DESCRIPTION OF THE OUTFIT

It contains the following 44 chemicals:

Ammonium Chloride
Alum
Antimony
Boracic Acid
Charcoal
Sodium Nitrate
Sodium Carbonate
Sodium Borate
Sodium Sulphite
Manganese Dioxide
Oxalic Acid

Brimstone
Iron Oxide
Sulphate of Zinc
Magnesia Carbonate
Zinc, Metallic
Sodium Bicarbonate
Sodium Sulphate
Sodium Chloride
Calcium Sulphate
Barium Chloride
Lead Acetate

Ferrous Sulphate
Nickel Sulphate
Sodium Phosphate
Zinc Carbonate
Ammonium Sulphate
Ammonium Carbonate
Ammonium Aqua
Calcium Chloride
Chloride of Zinc
Copper Sulphate
Glycerol

Iron Chloride
Calcium Oxide
Stannous Chloride
Nickel Chloride
Hydrochloric Acid
Sulphuric Acid
Iodine
Mercury, Metallic
Tin, Metallic
Litmus Paper
Ferrous Sulphide

The following apparata are furnished:

One Standard Washbottle
One Alcohol Lamp
One Conical Glass Measure
One Erlenmeyer Flask
One Glass Funnel
One Delivery Tube

Six Assorted Test-Tubes
One Test-Tube Holder
Ten Sheets of Filter Paper
One Glass Dropper
One Spoon Measure

Glass Tubing
One book containing Treatise on Elementary Chemistry and 100 Chemical Experiments to be performed with this outfit.

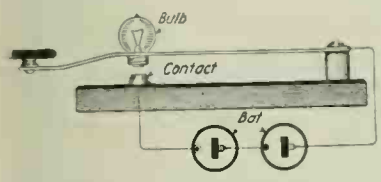
PATENT ADVICE

Edited by H. GERNSBACK

In this Department we publish such matter as is of interest to inventors and particularly to those who are in doubt as to certain Patent Phases. Regular inquiries address to "Patent Advice" cannot be anwered by mail free of charge. Such inquiries are publisht here for the benefit of all readers. If the idea is thought to be of importance, we make it a rule not to divulge all details, in order to protect the inventor as far as it is possible to do so.

Should advice be desired by mail a nominal charge of $1.00 is made for each question. Sketches and descriptions must be clear and explicit. Only one side of sheet should be written on.



Readers' attention is called to the fact that due to the great amount of letters to this department it is quite impossible to answer them all thru these columns. The inquiries answered in this issue date as far back as July, and if readers wish speedy service they should carefully note the announcement appearing in the preceding paragraph.

Code Practise Instrument.

(289) Geo. R. Griffin, Troy, N. Y., writes: "I have noticed in the November number of the ELECTRICAL EXPERIMENTER an article by A. E. Kopp, New Middletown, Ind., called 'Code Practise Instrument' and the fault you had found with it. I have an idea which might be of value to Mr. Kopp's instrument, and am enclosing copy of same with the request to publish the device at your convenience."

Mr. Griffin suggests putting the lamp of the practise outfit right on the key lever as shown in our illustration. By this means the bulb is screwed in the socket made for that purpose on the lever of the key. This has a tendency to light the bulb on the downward stroke instead of the upward stroke.

A. This strikes us as a good solution of Mr. Kopp's idea, but of course in this case Mr. Griffin and Mr. Kopp should really be joint inventors in any future patent action. The solution seems satisfactory offhand.

Improved Code Practise Instrument.

Diving Mine.

(290) W. F. Ashe, Jacksonville, Fla., writes: "Has there been a patent issued for a 'diving mine'—power to be furnished by small motor or clockwork—one that will take in water on the surface of the sea, which will cause it to sink to let mine rakes pass by, and after it has gone down to about fifty feet, it will throw out water, and thus cause it to rise in time to blow a battleship up?"

A. To our knowledge there has never been anything of this kind invented before, and we have never seen any reference to it. We think a device of this kind is more or less impossible.

Safety Soap.

(291) W. L. McGowan, Holdenville, Okla., writes: "To your knowledge has there been any device patented for preventing soap from being stolen or destroyed from public places? Furthermore what do you think of such a device. The device which I speak of is composed of a flat steel which runs thru the center of the soap and is fastened by chain at one end and small lock on the other. Any information that you can give me concerning this matter will be greatly appreciated."

A. This is a very old idea, and one which we have seen in actual use in hotel and public washrooms years and years ago. There is nothing novel about this, and nearly all of these devices have been superseded by automatic soap dispensing machines, such as liquid soap, where you only have to press a button to get a thimblefull of liquid soap in your hand, or the other device whereby you turn a handle which puts soap shavings into your hand.

Invisible Periscope.

(292) Mr. Geo. Ulrich, Newark, N. J., submits an idea of what he calls "invisible periscope" scheme. The outside of the periscope tubing is to be surrounded with a heavy glass tube while the space between the periscope tube and glass tube is to be filled with sea water. The periscope tube is to be painted to match the sea water. Our advice is asked.

A. While an ingenious idea, this is not different from many other similar devices which have been suggested in the past. The trouble is that it is not the periscope itself which makes the trouble, but the V-shaped wake of churned, white water which is left behind as the submarine speeds thru the water. The periscope itself can be and has been camouflaged in the past in such a way as to render it almost invisible within a hundred yards. Of course, this is all right while the submarine is not moving, but once it starts moving, the periscope immediately leaves a telltale wake behind.

Ice-Cream Cone.

(293) Gardner S. Wyman, Pittsburgh, Pa., says: "I would like to submit a plan for a paper ice-cream cone that is to take the place of cake cones now in use, as I understand there is a shortage of the latter; the plan is to make a cone of the same shape as cake cones out of fairly heavy wax paper, the latter to unroll like a paper pencil as the cream is eaten away." Our advice is asked on this idea.

A. We are afraid that while it looks feasible on paper, it would not work out in practise for the reason that it would at best be a very messy operation to thus unroll the wax paper, which surely would splash melted cream over the eater.

U.S. PATENTS

SEND FOR THIS FORM

Don't Lose Your Rights

Before disclosing your invention to anyone send for blank form "Evidence of Conception" to be signed and witnessed. A sample form together with printed instructions will show you just how to work up your evidence and establish your rights before filing application for patent. As registered patent attorneys we represent hundreds of inventors all over the U. S. and Canada in the advancement of inventions. Our schedule of fees will be found reasonable. The form "Evidence of Conception," sample, instructions relating to obtaining of patent and schedule of fees sent upon request. Ask for them,—a post card will do.

Electric Radiator.

(294) Earl F. Hobbs, St. Louis, Mo., has an idea of a hot water radiator, electrically heated with expansion tank and built on wheels so it could be moved from one location to another and from room to room. It could be made out of ¾ inch pipe with about a 500 watt element made from nichrome wire. The radiator to have a medium and a low point.

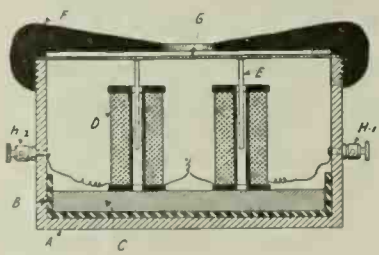
A. There is nothing fundamentally new in electrically heated water radiators as our correspondent suggests in his letter. We have in the ELECTRICAL EXPERIMENTER often described numerous electrically heated radiators of this sort.

Poison Shell.

(295) Joseph Vierthaler, Philadelphia, Pa., submits description and device of a poison shell which comprises an ordinary shell with a hollow center. Poisoned gas is enclosed in the shell, the latter is put in the shell when manufactured. Our advice is asked.

A. There is nothing new at all about this, and the present gas shells as have been used by the Germans as well as all the Allies and the United States are made along precisely this plan.

Fan Guard.



(296) Ladimir H. Svoboda, Cleveland, Ohio, writes: "As editor of the 'Patent Advice' I would appreciate your advice on the following: Would it be advisable to employ a guard for a small special electrical fan having blades but 3" long? The guard if employed must be dissectable. I have been advised to use a 'sand guard.' Could you give me details as to this or any other dissectable guard?"

A. We see nothing fundamentally difficult in making a detachable fan guard to work in conjunction with a small fan. It seems that any model shop or a clever experimenter ought to be able to devise such a guard, which seems a very simple undertaking. We do not know, however, what you mean by sand guard. We do not know to what this refers.

Telephone Receiver.

(297) Frank W. Harrington, Fulton, Ill., sends in a sketch of a telephone receiver which we reproduce herewith. The idea is to employ two bobbins having a central opening which are to pull in two soft iron needles 1/32 inch in diameter attached to the diafram as shown. We are asked if this design is good, whether the telephone is sensitive and whether the device has ever been tried before.

A. This is a similar idea to one described some time ago in these columns. Right here we want to say that any telephone receiver as a rule,—with very few exceptions,—which has its diafram weighed so as to interfere with the free vibration of the latter, usually is less sensitive than the diaframs which swing free. We are quite convinced that the construction shown by

Novel Idea in Telephone Receiver Design.

our correspondent would not prove very sensitive. The idea is of course not new, having been tried quite a number of times before.

Soldering Iron.

(298) K. Mowat, Atkins, Mich., writes: "Will you please tell me if an electric soldering iron which operates on six volts, six amperes is patentable. It has three holes bored in the iron in which is placed carbon of a certain size insulated by asbestos and connected together by copper strips, the whole being wrapped in asbestos which is held on by iron wire twisted at the ends.

A. Without knowing all the details of the construction, it is impossible to tell where this device would be patentable or not, and if it would work out in practise. We would advise our correspondent to first build a model and convince himself if it works satisfactorily before attempting to patent it.

NEW "GERMAN" ALARM CLOCK.

An electric alarm clock which awkens deaf sleepers by jarring their beds has been invented in Germany.

They should put one under the Kaiser's bed to awake him to the fact that the Potsdam Gang is *"spurlos versenkt!"*

NEW ELECTRIC FIRE DETECTOR AND ALARM.

The new quick alarm fire detector here shown supplements and supersedes watchmen. It is superhuman in responsiveness,

New Type of Electric Fire Detector and Alarm.

incessantly watching every part of the home or building. It operates the moment the air in close proximity to the ceiling becomes heated at the rate of 4 degrees Fahrenheit per minute. For example: A single newspaper on fire in a room having as much as 500 sq. ft. of floor space heats the air suddenly enough to cause a single detector to operate in 5 seconds.

This detector is radically different from common types of automatic alarms, thermostats and sprinklers which depend upon alloys, soft solder, bi-metallic compositions, dissimilar metal or mercury requiring a slow rise or fixt temperature of from 110 to 250 degrees. Before such systems operate, the fire gains tremendous headway, making it necessary to call the fire department to the scene, which means another delay of at least five minutes and inevitable damage. The inventor claims that this new fire detector enables one to locate the seat of the fire and to extinguish it single-handed, long before it gets hot enough to operate automatic sprinkler systems. The principle upon which it operates is simplicity itself. The very air heated by the incipient fire inflates a (non-metallic) diafram, joining two solid silver contact points, instantly closing the electric circuit. The detector is as sensitive below zero as above, but, by reason of its automatic compensating feature slow or local rises in temperature such as produced by hot water systems, furnaces, open grates, kitchen stoves or steam boilers cannot cause a false alarm. The automatic compensator insures that the air pressure under normal conditions is always the same inside the detector as that of the surrounding atmosphere.

The detector is very largely composed of a stone-hard insulating compound in which various elements have been permanently molded for permanent protection against wear and short-circuiting. It may be installed as easily as the ordinary household door bell or call bell systems, making use of bells, horns, signal lights, annunciators and batteries. It is compact, requires no assembling or adjusting, can easily be detached and removed from one building and again installed in another without the slightest damage.

CABLE BOX FIRE EXTINGUISHER.

To extinguish fires in electric cable boxes, where water might cause short circuiting, a device has been invented for injecting flame-smothering gases.

www.americanradiohistory.com

ONE READER'S EXPERIENCE WITH DR. ABRAMS' THOUGHT TRANSFERENCE THEORY.

As our reader's will recollect, we suggested in the September issue in connection with the article therein entitled "Popular Demonstration of Thought Transference and Other Phenomena," by Dr. Albert Abrams, that they write us as to what success they have attained in conducting any of the experiments outlined by Dr. Abrams in this little known realm of science, and we are pleased to give herewith the views of Mr. J. W. White of Brooklyn, N. Y., Mr. White having witnest a number of these tests as conducted by Dr. Abrams himself, when visiting San Francisco several years ago. Furthermore. Mr. White, who is in the electrical business in New York City, and a thoroly wide-awake student of electrical and allied matters, had the satisfaction of taking part in some of the experiments in Dr. Abrams' laboratory, and his views as given below are those of an unprejudiced and unbiased student.

Many people undoubtedly who have read the article in question have tried, unsuccessfully perhaps, to obtain results by *unipolar currents*, according to the theory of Dr. Abrams, such as for instance where the "percipient" or person interpreting the thought transference signal or message is connected to another person or body which forms the exciting point in the unipolar (single wire) circuit.

Here, for example, is what Mr. White experienced, and in this connection it is well to remember that the high professional standing of Dr. Abrams in the medical and scientific fields precludes all doubt of any fake or misrepresented reactions or phenomena, however little we may as yet know as to the exact mode in which such phenomena take place. First Dr. Abrams placed Mr. White in a separate laboratory room and gave him a permanent steel bar magnet, which as we all know has a *North* and *South* pole at the alternate ends. The Doctor instructed Mr. White to present either magnet pole as he might elect to the steam radiator in the room, when he would be able to tell in his instrument laboratory just which end of the magnet he had presented. According to the theory of Dr. Abrams, the action here was as follows: That the electronic discharge from the magnet, even when held a short distance from the radiator, charged the metal piping system, and this particular discharge past along thru the radiator and metal piping to the laboratory where an instrument or a human substitute for the instrument was connected by *one wire* to another radiator connected to the system. In this connection it is interesting to note that Dr. Abrams usually prefers to employ some delicate human reflex, such as the heart or stomach reflex, for indicating when one of these extremely minute electric currents arise, and which agents he claims are many *hundred thousand times* more sensitive to minute currents than are the most delicate scientific instruments such as galvanometers, etc. To sum up this experiment, Dr. Abrams was able to tell quickly just which magnet pole Mr. White had presented to the radiator, not making a single miss in twenty tests.

One of the most astounding phases of this particular experiment was when the Doctor informed Mr. White that it was not at all necessary that he present the magnet to the radiator, so as either to touch it or approach close up to it, but that he could determine which pole of the magnet the investigator was *thinking of* if he would but lay it on the floor and *concentrate his mind*

'Answer the call of Your Calling Now

IF you like electricity and are electrically inclined—there is where you will be most successful; for electricity is your calling. And the great field of electricity, with its superior advantages, opportunities and possibilities is calling to you *now*. Answer that call by obtaining the thorough, complete and practical electrical education, training and development this school offers. You will need ability because only electrical men with ability are chosen for the high electrical places. But don't just *work* at electricity, *learn* electricity. Don't just be *ambitious*. Be *determined* to succeed as one of the thorough efficient electrical men so anxiously sought. Enroll with this school now—don't wait and waste your time.

Become An Electrician In One Year Here Or Learn An Electrical Trade in 6 Months

THE courses here are practical, with the essential theory, mathematics, drafting, etc. You will have electrical appliances, tools, instruments, machines, motors, generators, etc., to work with while learning, to design, build, repair and operate—learning by actually doing as well as from classroom study and lectures. Also, there are fully equipped laboratories here—students performing 383 experiments a year. And you will obtain here in a short time the electrical knowledge and ability the electrical world requires, which you will need to succeed.

You Can Earn While You Learn

All your school periods here will be confined to morning or afternoon—with a half day free. And, if you choose, you can work one-half day at good pay in a position provided you by this school. And thus you can earn while you learn and help defray your school expenses—and obtain, as well, the valuable experience by working. Evening classes are likewise conducted and you can work all day and earn more money, if you prefer. Clip the coupon at the right here—get catalog and details of this school's courses, the "Earn While You Learn" plan and the many advantages here for you. Clip and mail the coupon.

Learn Telegraphy-Wireless

Right In Your Own Home, in your spare time

Remarkable opportunities are offered experienced wireless operators and telegraphers. The demand is greater than the supply—steady positions at increased pay and rapid advancement are assured.

DEPENDABLE KNAPP ELECTRIC SPECIALTIES

Combination Wireless-Telegraphy Outfit

will soon make you an accomplished operator. Teaches Light and Sound Signals, both Radio and Morse. Outfit consists of exceptionally fine Telegraph Key, Buzzer, 3 Binding Posts, Lamp, Lamp Socket and Control Switch—all mounted on a highly finished base. Two outfits can be operated at considerable distance apart for sending and receiving practice.

$3.00

This Same Outfit Without Lamp $2.50

Or your dealer can secure it for you. Order to-day. Descriptive circular and catalog of celebrated Knapp Motors and Electrical Specialties from 10c up mailed free on request.

Knapp Electric & Novelty Co., 523 W. 51st St., N. Y.

BECAUSE OF THE

SHORTAGE of CRUDE RUBBER

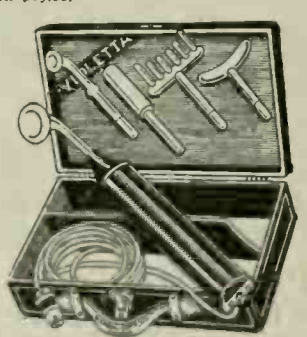
You can SAVE $10.00 on our Standard

VIOLET-RAY MACHINE

Being afraid that we could not get delivery on hard rubber used for the outside casing of the Violetta machine, we made 250 of these in wood. Now these machines are exactly alike in construction mechanism and workmanship as our latest model standard machine which costs $25.00.

The only difference being that instead of using hard rubber for the casing, wood is used, but it is finished in a beautiful black piano finish, and the difference is hardly noticeable.

Now, we cannot send these out as standard machines so are placing them in a special lot at



$15.00

an actual saving to you of $10.00. Besides we guarantee these machines to be new. The Outfit includes the generator, one general electrode and a handsome carrying case.

How to secure one of these machines:

Send only one dollar to pay express charges and we shall send you one of these instruments by express for your examination. This amount will be deducted from total cost of machine. You need not accept if not satisfactory.

Send at once for this is the only lot we shall have of these machines and prices on the standard machine will advance in 30 days.

BLEADON-DUN CO.

What 15c will bring You from the Nation's Capital

Washington, the home of the Pathfinder, is the nerve center of civilization; history is being made of this world capitol. The Pathfinder's illustrated weekly review gives you a clear, impartial and correct diagnosis of public affairs during these strenuous, epoch-making days.

The little matter of 15c in stamps or coin will bring you the Pathfinder 13 weeks on trial. The Pathfinder is an illustrated weekly, published at the Nation's center, for the Nation; a paper that prints all the news of the world and tells the truth and only the truth; now in its 26th year. This paper fills the bill without emptying the purse; it costs but $1 a year. If you want to keep posted on what is going on in the world, at the least expense of time or money, this is your means. If you want a paper in your home which is sincere, reliable, entertaining, wholesome, the Pathfinder is yours. If you would appreciate a paper which puts everything clearly, fairly, briefly—here it is. Send 15c to show that you might like such a paper, and we will send the Pathfinder on probation 13 weeks. The 15c does not repay us, but we are glad to love us to new friends. **The Pathfinder, Box 70, Washington, D.C.**

TYPEWRITER SENSATION

PROMPT SHIPMENT.

$4.00 per month buys a beautifully reconstructed, latest model visible typewriter, with back spacer, decimal tabulator, two-color ribbon, etc. Every late style feature and modern operating device. Sent on approval. Catalogue and special prices free.

Harry A. Smith, 738, 218 N. Wells St., Chicago, Ill.

on one of the poles. This experiment was checked up by a considerable number of tests, and Dr. Abrams was able to tell the pole concentrated on in Mr. White's mind each time.

One of the experiments which will interest our readers very greatly, especially those who read the article referred to in the September issue, was that where Mr. White became the "percipient." To show the effect of the electric currents in the body, Dr. Abrams had a strong man placed in a separate laboratory, several rooms away from where Mr. White was located, and both this man and Mr. White were connected by a *single* copper wire. A number of heavy weights were placed in the room with the strong man. The percipient—Mr. White—had attached to one of his fingers a pulse detector of these minute electronic currents, as devised by Dr. Abrams, comprising a small rubber tube strapt to the finger; this tube being connected by means of a rubber tube with a small pneumatic chamber attached to a pivoted arm, the free end of which carried an electric contact for opening and closing a signal circuit. The contacts on this instrument were conected with a battery and an electric signaling bell. This pulse indicator was connected and acted in the same way, upon the receipt of each electronic wave or current, as the straw pulse needle indicator described in the article referred to.

This is what happened every time the strong man lifted the weights in the distant part of the laboratory buildings: An electronic current apparently shot along the wire and acted to cause a heart reflex in the percipient's (Mr. White's) body, which manifested itself at the pulse, and in turn this action repeated itself thru the rubber tube attached to the finger, thus causing the pneumatic diafram chamber to vibrate and move the pivot arm attached to it, which in turn caused the electric signal bell to ring each time a weight was lifted by the "agent."

Probably some of the most remarkable tests which Mr. White personally saw performed by Dr. Abrams were those where he was enabled to differentiate between different disease germs, and in some cases even the disease affecting a patient over a telephone or other wire. For some of these and other tests Dr. Abrams has devised a very interesting instrument to take the place of the stomach reflex, thus doing away with the necessity of a "live" percipient. This instrument comprises an aluminum cylinder covered at one end with a tightly stretched diafram of goldbeater's skin. The metallic bell or rather shell of this instrument is connected to the single unipolar terminal used in this arrangement, instead of connecting the wire to a human percipient or interpreter, and whenever an electronic current was received over the wire, the tone of the bell, as produced by striking the diafram with a small hammer, is caused to be either resonant or full, or else dull, according to the reaction taking place. Moreover, disease germs such as tuberculosis, cancer, and pneumonja have their own vibration period or wave length, according to his most remarkable work, "New Concepts in Diagnosis and Treatment." He outlines forms of wireless tuning aparatus comprising condensers, tuning coils, etc., for the purpose of measuring the exact wave length or vibration index of these electronic currents as they are received over a telephone or other wire and interpreted by the instrument just described, or by recourse to a human percipient employing the stomach or other reflex. The stomach reflex is one in which the percussion sound given by the stomach when struck with the fingers over that portion of the body is dulled when an electronic current is received.

www.americanradiohistory.com

THE WIRELESS SITUATION.

(*Continued on page 625*)

ness of all companies having been suspended, and their operators having made an instant show of patriotism by joining the Navy in the earliest days of the war, it is believed that most of the companies owning radio stations would be glad at this time to sell their stations to the Government at a fair price, which is provided for in the bill; especially so, since all who have made a study of conditions under which radio communication is held must realize that it is only a question of time when Congress will enact some measure similar to this.

At this time, when most of the world is to be made over, when the United States is fostering the beginnings of a great merchant marine, whose servant radio-telegraphy is, and when the American news and American viewpoint are to be disseminated throughout the nations, it is submitted that the greatest good to the people of the United States as a whole will accrue to them from well-regulated communications with their ships at sea and with foreign nations at reasonable rates without interference from a variety of rival interests within our own borders, utilizing the system of stations which is absolutely necessary for the control of the Fleet. There is no such thing as successful naval operations these days without efficient radio communication, and this must be provided by stations running smoothly and efficiently in the hands of the Government long before hostilities actually commence.

The Navy Department has the confidence of Congress and of the people of the United States, and deserves the confidence which would be placed in it through the enactment of this very necessary measure.

THE FATAL BILL.

H. R. 13159. 65th CONGRESS. 2d Session.

IN THE HOUSE OF REPRESENTATIVES.

November 21, 1918.

Mr. Alexander introduced the following bill; which was referred to the Committee on the Merchant Marine and Fisheries and ordered to be printed.

A BILL.

To further regulate radio communication.

BE IT ENACTED BY THE SENATE AND HOUSE OF REPRESENTATIVES OF THE UNITED STATES OF AMERICA IN CONGRESS ASSEMBLED, That when used in this Act—

The term "signals" means the signals used in communication by any electrical system or method without the aid of a wire or other conducting connections;

The term "radio station" means any place, vessel, or vehicle containing apparatus used, or capable of being used, for transmitting or receiving signals;

The term "experiment station" means a radio station actually used for conducting experiments for the development of the science of radio communication or the apparatus appertaining thereto, and used for no other purpose except as a technical and training school station;

The term "technical and training school station" means a station actually used for purposes of instruction in radio communication and of training operators, and used for no other purpose except as an experiment station;

The term "person" includes partnerships, corporations, and associations.

Sec. 2. That the President shall requisition and take permanent possession of, for the use of the Government, every radio station on land or on a permanently moored vessel, now in existence within the jurisdiction of the United States or any of its possessions, other than experiment stations, technical and training school stations, and stations belonging to the United States or the Government of the Philippine Islands.

Sec. 3. That no person shall maintain or operate, on land or on a permanently moored vessel, (first) within any State any radio station capable of being used, (a) for the transmission of signals, the effect of which extends beyond the jurisdiction of such State or causes interference with the transmission or receipt of signals to or from any place beyond the jurisdiction of such State, or (b) for the receipt of signals which originate outside such State, or (second) any radio station within any Territory, district, or possession of the United States. This section shall not apply to experiment stations and technical training school stations duly licensed, as provided by the Act to regulate radio communication, approved August thirteenth, nineteen hundred and twelve, and stations belonging to the United States or the Government of the Philippine Islands. Whoever violates this section shall be punished by a fine of not more than $600 for the first offense, and by a fine of not more than $1,000 or imprisonment for not more than one year, or both, for each subsequent offense; and any radio apparatus operated in violation of this section shall be forfeited to the United States.

Sec. 4. That from the date of the passage of this Act the Secretary of the Navy shall be charged with the execution of the provisions of the Act approved July twenty-third, nineteen hundred and twelve, amending section one of an Act entitled "An Act to require apparatus and operators for radio communication on certain ocean steamers," approved June twenty-fourth, nineteen hundred and ten, with the Act entitled "An Act to regulate radio communication," approved August thirteenth, nineteen hundred and twelve, and any amendments to the said Acts, and the provisions of the International Radiotelegraphic Convention, signed in London in nineteen hundred and twelve and proclaimed by the President July eighth, nineteen hundred and thirteen, and future international radiotelegraphic conventions which may be ratified by the United States, except in so far as the provisions of the above-mentioned Acts, conventions, or treaties apply to stations operated by other departments of the Government of the United States or by the government of the Philippine Islands.

Sec. 5. That the Secretary of the Navy may issue special licenses, subject to such conditions and restrictions, and for such periods, as he deems proper, for the establishment and operation of stations for special emergency use in cases where no other rapid means of communication are available. Any violation of such conditions and restrictions shall constitute cause for revocation of the license without compensation therefor, and the owners of such station shall be punished by a fine of not more than $500 or by imprisonment for not more than one year, or both.

Sec. 6. That when the United States is at war or when war is threatened, or during any war in which the United States is a neutral nation, or during any national emergency, such fact being evidenced by the proclamation of the President—

(a) The President may issue regulations for the conduct and censorship of all radio stations and radio apparatus within the jurisdiction of the United States or of any of its possessions. Whoever knowingly violates any such regulation shall be punished by a fine of not more than $10,000 or by imprisonment for not more than three years, or both, and in case of any violation the radio station or apparatus shall be forfeited to the United States; and

(b) The President may cause the closing of any radio station on land or on a permanently moored vessel within the jurisdiction of the United States or any of its possessions and the removal therefrom of any radio apparatus, or may authorize the use of the station or its apparatus by the United States.

The regulations for the conduct and censorship of radio stations, the closing of a radio station, and the removal of apparatus therefrom shall continue no longer than the duration of such war or emergency. The fact that the war or emergency has ended shall be evidenced by the proclamation of the President.

Sec. 7. That if, in the opinion of the Secretary of the Navy, the operation of any radio station would interfere with the receipt of signals by radio stations belonging to the United States or the government of the Philippine Islands, or by radio stations on shipboard, or would be otherwise prejudicial to the interests of the United States, no license under the Act entitled "An Act to regulate radio communication," approved August thirteenth, nineteen hundred and twelve, shall be issued to such station, and any such license already issued to such station shall be revoked or suspended for such time as the Secretary of the Navy may prescribe.

Sec. 8. That when any radio station is requisitioned, taken possession of temporarily or permanently, or closed, or its license revoked or suspended, the United States shall pay to the persons interested therein just compensation for the property or interest so taken, provided that a claim for such compensation is made on the Secretary of the Navy, within two years after the date of passage of this Act. In case of disagreement as to such just compensation, the Secretary of the Navy shall make an offer, and if such offer is not accepted there shall immediately be paid to the person interested three-quarters of the amount offered. The person interested shall be entitled to sue the United States to recover the balance justly due, in the manner provided by section twenty-four, paragraph twenty, and section one hundred and forty-five of the Judicial Code. An amount sufficient to pay such just compensation is hereby permanently appropriated out of any money in the Treasury not otherwise appropriated.

Sec. 9. That all radio stations taken possession of by the President shall be operated under the direction of the Secretary of the Navy.

Sec. 10. That the Secretary of the Navy shall, so far as may be consistent with the transactions of Government business, open naval radio stations to general public business under regulations prescribed by him and shall fix the rates for such service. He shall establish special rates for the handling of press dispatches by transoceanic or other special stations. The receipts from such services, less an amount not to exceed twenty-five per centum per annum for expenses, shall be turned into the Treasury as miscellaneous receipts.

BROWNING GUN SUCCESSFUL IN AIRPLANE PROPELLER TEST.

The Browning machine gun has successfully undergone a test to determine its value for use with aircraft. This is one of three types of machine guns with which the rate of fire can be so synchronized that the gun can be fired by the pilot of a combat plane thru the revolving blades. Firing in that fashion, it is necessary to aim the machine gun by steering the plane directly at the target. The direction of the plane gives direction to the fire and the pilot can fire the machine gun while controlling the plane.

Airplane propellers revolve at from 800 to 2,000 revolutions per minute. The machine gun is connected with the airplane engine by a mechanical, hydraulic or electrical device, and impulses from the crank shaft are transmitted to the machine gun. The rate of fire of the machine gun is constant, and its fire is synchronized with the revolving propeller blades by "wasting" a certain percentage of the impulses it receives from the airplane engine and by having the remaining impulses trip or pull the trigger, so that the gun fires just at the fraction of the second when the propeller blades are clear of the line of fire.

The pilot operates the gun by means of a lever which controls the circuit and allows the impulses to trip the trigger. It has occurred in practise that as many as 15 shots have hit the propeller without putting the plane out of commission.

A FAKE ELECTRIC PISTOL TO SCARE THIEVES.

A new electric flashlight pistol of French invention for scaring criminals not only displays a bright light when the trigger is pulled, but also makes a noise like a real weapon as well.

BOYS

Learn Drafting

The United States Government and employers everywhere are looking for skilled draftsmen. They are offering splendid salaries, and still good positions are always open, because thousands of draftsmen have gone into the service. Others must take their places and carry on their work.

No line offers greater opportunity for advancement. Drafting itself not only commands good pay, but it is the first step toward success in Mechanical or Structural Engineering or Architecture. And drafting is just the kind of work a boy likes to do. There is an easy delightful way in which you can learn right at home in spare time. For 27 years the International Correspondence Schools have been giving boys just the training they need for success in Drafting and more than 200 other subjects. Thousands of boys have stepped into good positions through I. C. S. help, but never were opportunities so great as now.

Let the I. C. S. help *you*. Choose the work you like best in the coupon, then mark and mail it. This doesn't obligate you in the least and will bring you information that may start you on a successful career. This is your chance. Don't let it slip by. Mark and mail this coupon now.

TEAR OUT HERE

INTERNATIONAL CORRESPONDENCE SCHOOLS
BOX 6171, SCRANTON, PA.

Explain, without obligating me, how I can qualify for the position, or in the subject, *before* which I mark X.

BE AN ARTIST

HAW HAW HAW HAW

CHECK FROM MAGAZINE

DRAWN BY 14-YEAR-OLD BOY

The above cartoon was drawn by Master Bob Brennan of the Washington School of Art. Bob writes that he is selling his work and that he is cartoonist on a small paper in Evansville, Ind. He is but one of our many students and graduates who are making money as cartoonists, illustrators and designers.

Learn By Mail at Home!

By our new method of teaching drawing by mail you can learn in your own home, in a short time. Get into this fascinating work yourself and earn $50 to $100 or more per week!
The study is fascinating. Only a few minutes a day! Have your own studio or secure high-salaried position. Or work in spare time. Many students earn while they are learning.

FREE! BOOK AND ARTISTS' OUTFIT WRITE TODAY

A complete Outfit free to all students. Includes everything required to produce hundreds of dollars' worth of pictures. Write today. Special terms to a limited number of new students. Mail postal or letter for beautiful Booklet, "How to Become an Artist." Filled with drawings and full particulars of our extraordinary offer. Do it now—before you forget.

WASHINGTON SCHOOL OF ART, Inc.
1391 H Street, N. W. Washington, D. C.

"I Would Not Part with it for $10,000"

So writes an enthusiastic, grateful customer. In like manner testify over 100,000 people who have worn it. Conserve your body and life *first*.

The Natural Body Brace

Overcomes WEAKNESS and ORGANIC AILMENTS of WOMEN AND MEN. Develops erect, graceful figure.

Brings restful relief, comfort, ability to do things, health and strength.

Wear It 30 Days Free at Our Expense

For Children Also

Does away with the strain and pain of standing and walking; replaces and supports misplaced internal organs; reduces enlarged abdomen; straightens and strengthens the back; corrects stooping shoulders; develops lungs, chest and bust; relieves backache, curvatures, nervousness, ruptures, constipation. Comfortable and easy to wear.

Keep Yourself Fit

Write today for illustrated booklet, measurement blank, etc., and read our very liberal proposition.

HOWARD C. RASH, Pres. Natural Body Brace Co.
286 Rash Building SALINA, KANSAS

Don't Wear a Truss

BROOKS' APPLIANCE, the modern scientific invention, the wonderful new discovery that relieves rupture will be sent on trial. No obnoxious springs or pads. Has automatic Air Cushions. Binds and draws the broken parts together as you would a broken limb. No salves. No lies. Durable, cheap.

Send on trial is proves it. Protected by U. S. Patents.

Catalogue and measure blanks mailed free. Send name and address today.

C. E. BROOKS, 203B State Street, Marshall, Mich.

STAMMERERS

You can be cured quickly, permanently and privately. Write me personally for free booklet, "How to Stop Stammering."
Samuel O. Robbins, Pres., Boston Stammerers' Institute, 248 Huntington Ave., Boston, Mass.

PHILA. TO BE BIGGEST ELECTRICAL CENTER.

Philadelphia is to be made the largest electrical center in the world after the declaration of peace, according to plans now being perfected by the Westinghouse engineers.

The largest of forty-one plants under the Westinghouse management will be located on the Tinicum township tract near Lester, in buildings now devoted to war purposes. Twenty-five thousand men will be employed at the plant. All goods will be shipt from piers to be erected on the tract.

Experimental Chemistry

(*Continued from page* 639)

Chemical Properties.

1. *Yellow phosphorous* possesses great affinity for many of the elements, uniting with all directly, except nitrogen and Carbon. With Bromin and Sulfur it reacts violently. Characteristic is its affinity for Oxygen. When exposed to the air at 40° C. or at a lower temperature, if in a finely divided state, ignition takes place, burning to Phosphoric oxid, according to the supply of oxygen present.

2. It is luminiscent in the dark, even the minute particles adhering to the fingers on handling matches.

3. Because of its great affinity for oxygen, phosphorous is an energetic reducing agent. Sulfuric acid is reduced to Sulfur dioxid. Nitric Acid is deoxidized with explosive violence, salts of the metals are reduced to their metals and phosfides, thus silver nitrat is reduced to Silver and Ag_3P, Copper sulfate to Cu_3P_2.

Red Phosphorous. Properties. 1. This is an *allotropic* modification, and possesses properties essentially different from the yellow variety. It forms a dark red to reddish-brown powder, which is insoluble in carbon disulfid and all other solvents. It does not Phosphoresce, and is stable in the air. It does not fuse at red heat, but when quickly heated above 260° C. the vapors change to those of yellow phosphorous. This variety is prepared by heating the yellow variety to 300° C. in closed air-tight vessels, and after the conversion, the product is then treated with carbon disulfid to remove any of the unchanged phosphorous. If a little iodin be added, this change will take place below 200° C.

Scarlet Phosphorous. Properties. This is another modification, being obtained by boiling a solution of yellow phosphorous in phosphorous tribromid. It resembles the red variety except that it is more active, reducing salts of the metals, and with the alkalies, it yields *phosphin* [PH_3] and a hyposulfite.

Metallic Phosphorous. Properties. This form is obtained by heating the yellow variety in a sealed tube free from air to 530° C. It thus forms black metallic shining crystals, which are less active than the red variety.

Luminescence or Phosphorescence.

If a match is scratched in a dark room, a faint line of light may be observed as the minute particles of phosphorous which are left glow and oxidize. The same thing occurs if the element is exposed in darkness, and the phenomenon is called PHOSPHORESCENCE. It is due to slow combustion [or oxidation]. Substances rubbed with phosphorous give the same effect.

Many other minerals and chemical compounds have the power to emit light in darkness, and some of these form the basis of the so-called luminous paints. The sulfides of Barium, BaS, BaS_2, BaS_3, etc., are examples.

Some animals, as fireflies, glowworms, et cetera, emit a light from a certain part of the body, without heat above that of the rest of the body. In Cuba, a species of luminiscent insect is bottled up and used sometimes for lighting purposes, about *forty* of these equalling *one candle-power*. The light is apparently due to an oxidation of animal tissue which is under the control of the insect. To produce the same light by the oxidation of gas or oil, we have a temperature of about 2,000° F. and 99% of the energy of the flame is lost, while these creatures utilize possibly 100% of the energy of oxidation, without any apparent rise in temperature. The animal supplies its own light.

Uses.

Phosphorous is used mostly in the manufacture of matches. A kilogram (2.2 lbs.) of it will tip about *two million matches* It is also used to some extent for medicinal purposes.

Matches.

The making of matches after the splints are prepared includes two processes. First, one end is dipt into melted sulfur, some of which adheres to the wood. Second, it is tipt with a paste consisting of a mixture of phosphorous, an oxidizing agent, and glue. A little coloring matter is quite frequently added. The oxidizing agent may be Potassium chlorat [in which case the match snaps and burns vigorously on being scratched], potassium nitrat, Manganese dioxid, or red lead [Pb_3O_4]. This result is accomplisht by pressing the end on a slate slab covered with the paste. Sulfur is necessary, as the heat liberated in the burning of phosphorous is not enough to set the wood on fire, and a coating of P_2O_5 forms over it. Sometimes paraffin is utilized in place of the sulfur. The well-known Swedish [or Safety] match head does not contain phosphorous, but consists of a mixture of potassium chlorat and dichromat with red oxid of lead and antimony sulfid. They are ignited by scratching them on the prepared surface of the box, which is essentially a mixture of red phosphorous, antimony sulfid and powdered silica. A machine has been constructed to cut the splints, tip the matches, and dry and pack them in boxes, all four processes being automatic and continuous, besides eliminating the poisonous fumes.

A Burning Match.

Whenever one ignites so simple and common a thing as an ordinary match, little does he realize that he is performing one of the most wonderful and complicated of chemical experiments. The mere fact that fire could be obtained by simply scratching the end of a stick was regarded less than three-quarters of a century ago, as a truly remarkable triumph of science.

Friction on the end of a match over a rough surface liberates heat enough to cause the phosphorous to unite with the oxygen of the oxidizing agent in the paste, and produce combustion, the main product of which is P_2O_5. If the oxidizer is potassium

www.americanradiohistory.com

chlorat, then potassium chlorid is left. The heat of the burning phosphorous is enough to set fire to the sulfur, which unites with the oxygen of the air to form sulfur dioxid, and this in turn sets the wood on fire.

The reactions of a *burning match* are many. Try and complete the following and explain from what each comes, then the next time you strike a match you will probably stop to think of the complicated change which takes place. This only goes to illustrate that many seemingly unimportant operations made during our daily routines may, if carefully analized, show the complicated changes which take place unobserved.

1. $KClO_3 = ?$
2. $2P + 5O = ?$
3. $2P + 3O = ?$
4. $P_2O_5 + H_2O = ?$
5. $P_2O_5 + 3H_2O = ?$
6. $P_2O_5 + H_2O = ?$
7. $P_2O_5 + 3H_2O = ?$
8. $S + 2O = ?$
9. $SO_3 + H_2O = ?$
10. $C + O = ?$
11. $C + 2O = ?$
12. $CO_2 + H_2O = ?$
13. $2H + O = ?$

Phosphates.

Wheat contains compounds of phospborous, and most food plants in order to come to fruitage must take phosfates from the soil in which they grow. The phosfates must be soluble, so that, as the rain dissolves it, it can be absorbed by the roots and circulated in the sap of the plant. Soils have to be renewed or fertilized, and fertilizers contain, among other things, the soluble phosfate $H_4Ca[PO_4]_2$, made according to the first step in reducing the element. This is absorbed, transformed, and assimilated by the plant, especially the fruit.

Animals eat the fruit, and thus the compounds of phosphorous are again transposed, circulated in the system, and deposited wherever needed, as in the bones and nervous tissues, and especially in the brain. Man feeds upon either plant or animal, *and thus obtains his phosphorous. From the human system it is excreted by means of the blood and kidneys, as phosfates and microcosmic salt* $[HNaNH_4PO_4]$. *When the brain is hard worked, more than usual is excreted;*—in fact, there seems to be a *direct ratio between the amount excreted* and the *vigor of brain action*, as tho each intellectual effort was attended by the combustion of phosphorous. A simple test of the urine will demonstrate this. At the start of the day the urine will, under normal conditions, appear clear yellow. Examine a sample of urine from the same subject taken after a hard day's brain work, and you will be surprised to see many little white specks floating about. This represents the phosphates, and while the laboring man may show but little, if any, of these suspended phosphates in the urine at the end of a working day, the brain worker will invariably manifest this condition regularly. To clear the urine in order to test it for any solids or sediment, add a little nitric acid. It will clear up perfectly if the urine is normal.

Experiment No. 147.

Place about 12 heads of ordinary (not safety) matches in a flask, as shown in Fig. 155. Have this flask (1) about half filled with water. Proceed to distill the same by applying the Bunsen burner under the flask, taking care that the action does not become too violent.

If this experiment is performed in a darkened room a ring of greenish light appears at the level of the water in the condenser, where the steam condenses. After a short time little colorless spheres of a waxy solid collect under the water in the second flask, which acts as a receiver for the drippings from the condenser. If the water is poured away, this solid begins to give off a white smoke, and is luminous in the dark.

(To be continued)

Learn to Treat Disease This Way

This is a small reproduction of one of 22 magnificent charts all of which we want to send you ABSOLUTELY FREE, just to show you how easily you can master Chiropractic and how successfully you can treat disease by this modern drugless healing method. These charts show the different pain and nerve areas of the body. The science of Chiropractic is based upon the well known principle that when there is bone pressure on a trunk nerve where it leaves the spinal column there will be pain in the area it controls; and that by relieving the pressure the pain is banished. Chiropractic teaches you how to locate nerve pressure at any point along the spinal column and how to relieve it.

BE A DOCTOR OF CHIROPRACTIC

Advanced Science of Spinal Adjustment

The great profession that within the past few years has taken the longest forward strides ever known in the history of drugless healing. It has called to its ranks thousands of ambitious men and women from every walk of life. Today it is calling more insistently than ever because the tide has turned strongly in favor of drugless healing. Right now the demand for Doctors of Chiropractic is far greater than the supply.

Learn at Home In Spare Time The American University method of teaching enables you to study by mail or in class and obtain a complete mastery of Chiropractic in the shortest time consistent with thoroughness, while you hold your position. You can pay on easy terms. From the day you enroll your instruction will be under the personal direction of a splendid faculty of Chiropractic experts. Our one aim will be to make you successful. We will work whole-heartedly with you to advance your interests so that in a short time you, like thousands of Chiropractors, can earn a good income.

$3000 to $5000 a Year

There are many instances of Chiropractors earning from $3000 to $5000 a year. Some upwards of $10,000. Dr. M. D. Moore, of Kentucky, reports an income of $9,000 a year. Dr. L. H. Roche, New Jersey, $5,000; Dr. Hanna, of Kentucky, over $5,000 yearly.

The success of Chiropractors in many cases has come so quickly as to be almost startling. And yet, it is not to be wondered at when you consider the constantly increasing number of intelligent, thinking people who are now convinced that Chiropractic is the common-sense and really scientific way to relieve pain and disease and who, therefore, demand the services of Chiropractors.

NOW—Your Great Opportunity

Why not qualify now for this splendid profession that offers such remarkable possibilities for making you prosperous and independent? If you are ambitious to make money, increase your social standing and be "somebody," our course in Chiropractic will point the way. No special preliminary study required. You graduate with the degree of D. C. (Doctor of Chiropractic), receive handsome diploma, FREE, and are ready at once to open your office.

Get Free Charts offer at once. Regular value of the 22 magnificent charts is $30.50. Many of these charts are handsomely lithographed in life-like colors. Mail coupon and get all the facts. We will send you our beautiful new illustrated book, full particulars regarding course, easy terms, together with free charts offer immediately. Don't put it off—mail coupon or send your name on a postal card—today.

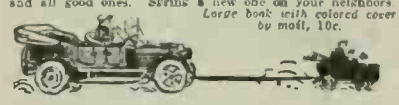
HEL-MET THE KAISER

Send one to your boy in camp; all the boys will want them. Anyone against the Kaiser or Germany should wear this pin. Same size as picture. Handsome metal, black letters. Will wear for years. Men and women wear them — causes laughter wherever seen.

Price 10 Cents

Voice Thrower 10c



Learn to throw your voice into a TRUNK, under the bed, out in the hall or anywhere. Lots of FUN fooling the Teacher, Janitor, Policeman, Parents, Neighbors, or Friends.

THE VENTRILO

is a little instrument that fits into the mouth out of sight. BOYS or GIRLS can use it. NEVER FAILS! A 32-page book on Ventriloquism sent with the VENTRILO for TEN Cents.

NEW FORD JOKE BOOK 1919

All the latest jokes on the Ford auto. Hundreds of them, and all good ones. Springs a new one on your neighbors. *Large book with colored cover by mail, 10c.*

Devil Resigns to the Kaiser

Everyone who reads this book is wild over it. Contains the following:— The Kaiser's Dream, A Letter from the Devil to the Kaiser, Kaiser's Prayer, How Satan Resigns to the King of Devils, The Kaiser, etc. any other stories, jokes, etc., about the German Emperor. Book mailed 10 cents, postage 2 cents extra.

ROGEN X-RAY

Price 10 Cents

HERE, BOYS, is just what you want. With this instrument you can apparently see through clothes, see the bones in your fingers. Think of the fun you can have with it! Sample, by mail, TEN CENTS.

SKULL RING

Here is a handsome, up-to-date Ring, representing a Skull and Cross-bones. Has stones in the eyes and looks something frightful. Women won't like it, but for men or boys it is a great novelty. Sample, by mail, 15c.

Gee! What a Wad!

This is STAGE MONEY

Looks like the GENUINE STUFF. Some Green backs and some Yellow backs. Create a BIG sensation among your friends. The girls will all be after you when they see the wad. BIG roll of 15 pieces by mail. 10 cents.

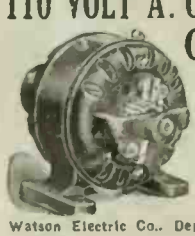
Boys Own Toy Maker

and Nine Other Books for 10c

Tells how to make a Telephone, Magic Lantern, Kites, Sail Boat, Stilts, Electric Telegraph, Pop Gun, Red Fire, Galvanic Battery and many other things. This book, with nine other interesting books, mailed for 10c.

ENCHANTED BARREL

The Most Wonderful Pocket Trick Made



CHANGE A CENT INTO A DIME

Ask your friend to drop a dime in the barrel. When he takes it out, Behold! It is a CENT. You make 9 cents every time you fool them. Never fails. They cannot get on to it. Sample barrel, with directions, only.... 10c

Any three of the above articles for 25c or any six for 50c

POPULAR ASTRONOMY.

(*Continued from page 621*)

There is the possibility that forms of life may exist on these satellites of Jupiter, tho they may, on the other hand, be barren, lifeless worlds, such as Mercury and the Moon. Their great distance from the earth, never less than three hundred and sixty-eight million miles, makes observations of their surface markings very difficult.

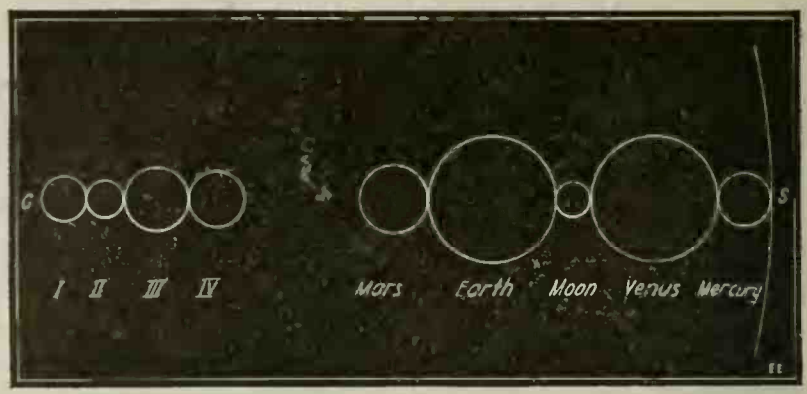

Diagram I.—Showing the Relative Sizes of the Four Moons of Jupiter, Io, Europa, Ganymede and Callisto, or Satellites I, II, III and IV Respectively, and the Moon and Terrestrial Planets Mercury, Venus, Earth and Mars. The Distance from C to S Is the Distance from the "Center" to the "Surface" of Jupiter. So If All the Satellites of the Planet and the Terrestrial Planets and Moon Were Placed Side by Side Their Combined Diameters Would Fall Short of the Surface of the Planet by a Distance About Equal to the Diameter of the Earth.

How beautiful beyond description must the heavens appear as viewed from the satellites of Jupiter! From the nearest of these, Io, or Satellite I, the mighty planet Jupiter presents a spectacle such as the eye of man has never been privileged to behold. The huge flattened globe, ninety thousand miles in equatorial diameter, equal in mass to *three hundred planets such as our own* and in volume to nearly *fourteen hundred*, fills a space in the heavens nearly twenty degrees in extent as viewed from this satellite. Fifteen hundred of our own full moons would hardly fill the same space. Whirling on its axis with frightful speed in a period of less than ten hours, the huge ball glides rapidly but majestically onward thru the sky. A far distant sun shrunk to but one-fifth the diameter of the full moon throws light and shade across the rapidly changing surface of the planet, rich in the reds, browns and yellows and all the gorgeous shades and tints of its dense, seething, gaseous envelope. The phases of the moon on a greatly enlarged scale rapidly succeed each other on Jupiter as the satellite views it from all positions with reference to the sun. The cause of the belts of Jupiter, that lie parellel to the planet's equator and are constantly changing in number, width and shade, as well as of all the peculiar splashes of color and intensely white flecks that come and go in the dense atmosphere of the planet, could doubtless be explained were it possible to view the great planet from its nearest satellite, which is about as far from the surface of Jupiter as the moon is from the earth. It is uncertain whether the planet is entirely gaseous thruout or has a central core of solid or liquid matter. Its density is only one and one-quarter that of water and slightly less than that of the sun, showing that it is composed largely, if not entirely, of matter in a gaseous state. Jupiter is a world as different from our own as it is possible to imagine. There is no visible surface crust and there are no permanent markings. Different spots on the planet's disk give different periods of rotation showing that atmospheric phenomena are observed. All is constant flux and change. Dense vapors arise from a highly heated interior and spread out into belts parallel to the equator and in the direction of the planet's rotation. From its nearest satellite all the interesting changes of color and form that constantly take place in the atmosphere of this great globe could be observed in great detail. The high percentage of light and heat that Jupiter reflects from the sun to its nearer satellites would make it a secondary sun to them of tremendous size but feeble strength. As seen from the nearest moon the other three major moons of Jupiter present all the phases of our own moon in rapid succession, due to their constantly changing positions with refcrence to the sun. The five small moons, discovered in modern times, are so minute that they are simply star-like points of light even when viewed from the other moons of Jupiter.

When nearest each other some of the moons appear even larger than our own moon does to us, but when approaching opposite sides of the planet their disks rapidly diminish in size tho they never appear as small as the far distant sun nearly five hundred million miles away whose apparent diameter is less than one-fifth that of the full moon.

To keep track of the rapidly changing positions and various phases of the moons of Jupiter as seen from any one of them,

Diagram II.—Orbits of the Four Old Satellites of Jupiter, and Satellite V, the First to Be Discovered of the New Moons. Satellites VI and VII Are Nearly Seven Times More Distant and Satellites VIII and IX Nearly Fourteen Times More Distant Than Satellite IV. The Period of Revolution of Satellite V Is 12 hours and of Satellite IX 3 Years. Scale .5 Cm. = 200,000 Miles.

as well as the rapid apparent motion of the planet thru the sky due to the revolutions of the satellite itself, would be a troublesome task for an astronomer stationed on one of these far distant worlds. It would be a common sight to see in the sky at one time the huge planet, the sun itself, and one, two or three moons. Seen from the moons of Jupiter the contellations would appear as they do to us on earth for such a slight change in position as five hundred million miles, more or less, is trivial when one is measuring the relative distances of the stars. Observations of the stars from the nearest moon of Jupiter would be attended with difficulties at times, however, since reflected sunlight from a body nearly twenty degrees in diameter would be extremely troublesome, especially were the phases of the planet near that of the full moon. Even from the fourth or most distant of the major satellites the planet would subtend an angle of nearly five degrees. Occultations of the stars would be many and frequent as the huge planet globe glides swiftly thru the heavens. Many a moonlight night would appear almost as day owing to the presence of the enormous brilliantly reflecting ball of light and occasionally two or three moons in addition. Only the brightest stars would be seen under such circumstances. When, however, the small worlds pass into the shadow of the great mother planet and not only the light of the sun but also the reflected light of Jupiter disappears for many minutes the stars shine forth in all their glory there as here. In the sky would appear, possibly, some of the larger moons feebly shining by the reflected light of the far distant sun. Saturn also might be visible, but beautiful Venus and ruddy Mars would fail to appear. Tiny bodies, mere specks of light at this distance, they are lost to view in the glare of the sun.

(The next Installment will appear in an early issue.)

ELECTRIC DEATH TRAPS IN HUN'S RETREAT.

(Continued from page 608)

to blow the cave to pieces, and which was connected up with an electric device to the time-clock also. Thus did the Boches not only hope to gas their victims, but to kill them as well, one way or the other.

The daily press had considerable to say in the later months of the war concerning the many devilish and ingenious *delayed time-fuse bombs* which were left behind in many of the towns and cities of northern France as the Hun army was being driven toward the Rhine by General Foch's victorious armies. One of the simple devices of this nature, which was used to blow up buildings, etc., a considerable length of time after the Huns had retreated from a certain locality, is shown in Fig. 10. It comprised nothing more than a float tank similar to those used on all modern plumbing for flushing purposes. As soon as it started to rain, such weather being frequent in northern France, the tank filled up and caused the float to rise. When the float ball reached its uppermost position it closed an electric circuit, connected by wires running inside the building, to a heavy charge of explosive, with results that can be better imagined than described. These cowardly and dastardly tricks sound quite tame and harmless when you read them "Over Here," —but imagine what havoc and untold death they have spread "Over There," where it often happened that troops had occupied a town for several days before some of these delayed time fuses functioned at unexpected moments!

NEW LIFE!
Health-Strength-Beauty
You can have bodily vigor, success-attaining energy—attractive healthful beauty! All yours at *practically no cost*—the great benefits of the famous VIOLET RAY TREATMENTS heretofore only procurable at big expense from Physicians and Beauty Specialists. TREAT YOURSELF at home with
Renulife Violet Ray
HIGH FREQUENCY GENERATOR
transforms electricity into the most powerful, effective, purifying Health and Beauty giving agency known to science, yet gentle, soothing, perfectly safe—no shock nor pain. Eradicates disease from blood, flesh, bone and nerves; tones and restores. While relieving pains and aches and the manifest results of disorders, it removes the deep seated cause. Saturates the system with invigorating, life-laden violet rays bringing back normal functioning.
TREATS Successfully
Rheumatism
Neuritis
Lumbago
Chest Pains
Catarrh
Headache
Ear Diseases
Hardening of Arteries
Wrinkles
Skin Diseases
Falling Hair
Etc., Etc.

Treatment forgeneral debility, nervousness etc.

Quick relief for rheumatism

Inhaling ozone. For Catarrh, throat and lungs. Marvelous local results with general tonic effect
Painless Electricity
Science has modified electricity that the weakest may stand its force without fear or pain. Every tissue and fibre is saturated, patient experiencing only a sensation of relief, as if standing in a ray of sunshine. *Violet Ray high frequency* has no comparison with old, crude, electrical batteries and shocking current. Every jar and shock is removed. The effects are marvelously rapid.
Lowest Priced—Most Effective
Violet Ray
For Home Use
Every person would be wonderfully benefited by a few minutes' daily use. Its astonishing low price places it within the reach of all. Write at once for full information regarding uses, benefits, price, etc.
Liberal *Trial Plan* Proves Value

GET FREE BOOK telling the whole marvelous story of the Violet Ray. Its wonderful successes—its many uses—specified by physicians for rheumatism, neuritis, headache, catarrh, wrinkles, blemishes, falling hair and 100 other bodily ailments and beauty defects, chronic and acute. Get this valuable book by return mail.

Strongfort
The Perfect Man

STOP SNUFFLING!

Sneezing, hawking, spitting and coughing. Why do you have catarrh anyway? You were not born with catarrh—you contracted it. This offensive, unwholesome, disagreeable complaint fastened itself upon you and grew. Nature is trying to prevent more serious consequences due to the congestion in your body, finds an outlet for the accumulated waste, by way of catarrh. You cannot get rid of it the way you are going—sprays, lotions, snuffing powders, drugs and medicines won't stop it. You know catarrh leads to other troubles—serious ones — throat, lungs, stomach, intestines—all become affected. You can never enjoy good health if you have catarrh; you won't be efficient in anything as long as you have catarrh, and it detracts from your personality to be hawking and snuffling around others.

Build Yourself Up

Be Clean—Wholesome—Healthy—Virile. Go at it the right way. Nature's way: no drugs, no medicines, and you banish catarrh from your system. Let me show you how, by my method of health building, body developing called

STRONGFORTISM

Its practice never fails—it builds new tissue, gives brawn and muscle, it invigorates heart action, strengthens kidneys, and makes the bowels move by their own natural strength. It makes every organ in your body pulsate to health. Under this kind of influence, catarrh quits for good, so will constipation, indigestion, nervousness, palpitation, rupture, rheumatism, weak heart, poor memory, physical weakness, vital losses, short wind, and all sorts and kinds of ailments and disorders.

If you are too stout or too thin, flat chested, or round shouldered—Strongfortism will alter it. It will make you grow in vigor and virility—and nervous energy—it will restore your vitality and keep your forces vital. No matter what your condition is now, or what habits you contracted or indulged in—I will show that you can renew yourself. You want to be strong, healthy—a virile man—you want to be all that a man ought to be and I can and will show you how to make yourself the man that is desirable from every standpoint.

Tell me your ailment and send three 2-cent stamps to cover mailing expenses, and I will send you my book, "PROMOTION AND CONSERVATION OF HEALTH, STRENGTH AND MENTAL ENERGY," written for your interest and welfare.

LIONEL STRONGFORT
Physical and Health Specialist
735 Park Bldg. Newark, N. J.

Skinderviken Transmitter Button

Nothing like it on the market. Will make an old transmitter better than new. Adjusted in a jiffy. Supersensitive. Talks at all scales. See our ad in the December or coming February number for innumerable uses to which it can be put.

Price $1.00 each. Discount in quantities.

Send us One Dollar, for which we will mail one button prepaid under our money-back guarantee.

EXPERIMENTAL MECHANICS.

(*Continued from page* 638)

secured to the saddle. The circle should be marked with a sharp *scriber* where the boring is to be done, also its final diameter. By bringing the work forward to the sharp point of the scriber which is attached to the boring rod, and slowly revolving said boring rod, the scriber making the proper mark, this will aid in boring the hole to the proper diameter. At the same time you can see whether the work is secured to the saddle with respect to the central line of the cutting tool, also live and dead centers. The cutting tool is held on block T. H., or tool holder, and is secured to the boring rod by a set screw. The boring rod is run between the centers and firmly attached to the *live* spindle by means of a *lathe dog* D to the face plate.

The novice can construct a very simple form of boring cutter, such as that shown in Fig. 4 This consists of the usual boring rod, B. R., which may be of any desired length, depending on the character of the work. The rod should be made of tool steel, heavy enough to prevent its springing or bending when used in boring. The longer the rod, the greater the chance of springing. It is therefore advisable to make the rod as short as possible. A one-half inch hole is made in the center of the boring rod, which is used to secure the cutting tool. This is about the size cutting tool that the novice will need in his work. Another hole is drilled at right angles to this one with a one-quarter inch drill and tapt for No. 18-5/16 inch thread. A headless set screw is threaded in, a saw cut being made on the outer end in order that it may be screwed in with a screw driver. The cutting tool should be made of the highest grade, self-hardening tool steel. Its length should not exceed one-half inch, the diameter of the boring rod. The cutting side of the tool is ground as indicated in Fig. 4, its bottom edge being slightly rounded, so that it will be prevented from chipping or breaking.

In boring a hole in cast iron, it will be found advisable to start with a heavy cut. This is done so that the sand or other silica particles that may have adhered to the cast iron when taken from the mould are immediately removed.

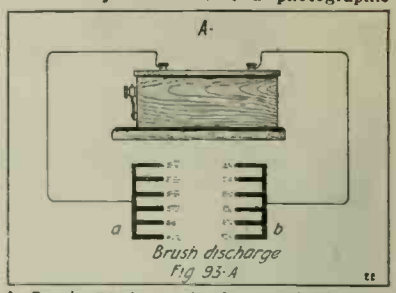
In the forthcoming issue the subject of "Taper Cutting" will be considered.

(*To be continued*)

Madrid gets its electricity for lighting and power from a hydro-electric plant 120 miles from the city.

A company in Japan has begun the production of soda by an electrical process.

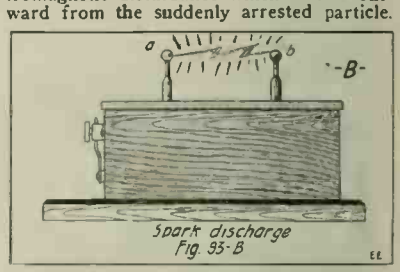
Electrically operated cash carriers for stores have been invented, the motors of which are supplied with current thru the wires on which they run.



EXPERIMENTAL PHYSICS.

(*Continued from page* 626)

sisted of negatively charged particles, remembering that an electric current is an *electric charge in motion*, and that an electric current tends to move in an electric field in a direction given by the three-finger motor rule (see Lesson 16). Hence, our present belief *that the cathode rays are negatively charged electrons.* The fact that these rays give a negative charge to bodies on which they fall douhly strengthens the theory. The deflectibility of the cathode rays in magnetic and electric fields furnishes us with the necessary data for computing the size, weight, and speed of the electron. The size and weight is extremely small, the speed tremendously large (about 100,000 miles per second).



Experiment 108.

In 1895, Roentgen while working with cathode rays found that a photographic

A Brush Discharge Is Composed of Many Fine Sparks, Forming an Effluve.

plate which he happened to have near the cathode ray tube *blackened* on development. just as if it had been exposed to light. On investigating, he found that a *radiation* outside the tube always accompanies the production of cathode rays. These radiations differ in many ways from cathode rays and are called *Roentgen* (or *Röntgen*) *rays* after their discoverer, also *X-rays*, the name given to them by their discoverer. These rays result from the sudden stopping of the cathode ray. The kinetic energy of the cathode ray when suddenly stopt by encountering an obstruction produces an electromagnetic disturbance which travels outward from the suddenly arrested particle.

A Simple Spark Discharge from an Induction Coil.

The velocity of the X-ray is found to be the same as that of light. For the production of concentrated X-rays, a special form (the focus tube) of cathode ray tube is used (see Fig. 97a). Cathode rays coming from the concave spherical surface *c* converge and strike platinum plate P, where X-rays are generated which radiate in a hemisphere as illustrated in diagram.

By moving a zinc sulfid screen around the tube, we find that the X-rays cause fluorescence. If the hand or some other object is placed on a photographic plate and X-rays are allowed to strike the plate, a short exposure will give an X-ray photograph (see Fig. 97b), because of the ability of X-rays to penetrate many substances *opaque* to light. This makes possible the photographing of interior parts of the human body for diagnosis. X-rays are similar to cathode rays in that they cannot he re-

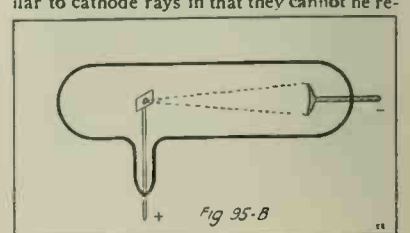


Fig. 95-B. The Cathode Is Concave and Spherical. The Anode Consists of a Small Piece of Very Thin Platinum. The Cathode Rays Are Converged, Focus on the Platinum and Are Therefore very Concentrated. The Platinum Incandesces, Thus Showing the "Heating Effect" of the Cathode Rays.

www.americanradiohistory.com

flected or refracted as light can, but they are different in many important respects. X-rays penetrate many substances which cathode rays cannot (X-rays pass right thru glass, whereas the cathode rays do not). X-rays cannot be deflected by electric or magnetic fields and hence cannot, like cathode rays, consist of electrically charged particles. The real nature of X-rays is still unknown. Lead seems to be the most difficult substance for X-rays to penetrate. Hence, lead is used as a screen to shield objects from X-ray action. Care should be taken in experimenting with X-rays as their penetrating power results in serious flesh burns under either protracted or oft repeated exposure to them.

(To be continued)

THE MANUFACTURE OF VACUUM DETECTORS.

(Continued from page 630)

than the filament when the tube is jarred.

After adjustment on the plate and grid has been made, the assembly is inserted into the prepared tubes and the end seals made. A short length of small diameter tubing is attached to the seal at one end of the tube, this being for connection to the pump manifold. The tube is then carefully annealed and is ready for exhaustion.

A number of tubes are sealed on the manifold in the oven and the temperature is gradually increased to 900 degrees Fahrenheit (480° C.) at which point the pumps are started. The tubes are heated in this manner before the pumps are started so that the air contained in the tubes may conduct the heat to the central elements and drive off the occluded gases (i.e., gases held in the molecular interstices of the wing, filament and grid structure). When the pumps have produced a vacuum of one micron, the temperature of the tubes is very gradually increased to 1000 degrees (540° C.). At this point they must be watched very closely as the melting point of this glass varies greatly and should the walls of the tubes become soft, the vacuum would cause collapse. From one micron, the vacuum slowly increases, and after about five hours of continuous pumping the tubes are sealed off at the manifold and allowed to cool in the oven.

McLeod gages are used in the measurement of vacua but I have found that a much more accurate vacuum comparison can be made using a large induction coil. For this purpose an electrode is sealed to the manifold or at some point in the vacuum line. One terminal of the coil is connected to this electrode and the other coil terminal is connected to the low vacuum pump. A calibrated spark gap is used on the coil and when the vacua is high enough and the residual gases are properly pumped from the tube a spark will jump the gap *without a glow in the vacuum line or tubes.* The vacuum used in the tubular detector will permit a five inch (12.5 cm.) spark between needle points in air.

Prof. Richardson has shown that when new metals are heated to incandescence they emit positive ions, probably because of the impurities or gases in the metal. I have found that this positive discharge must be eliminated to obtain maximum sensitiveness of the tubular detector, and this is accomplisht during the manufacturing stage by burning the filament on alternating current for about two hours. Tubes that have not been treated in this manner are found to be less sensitive than those in which the positive ionization has been destroyed.

A VERTICAL CABINET TYPE COUPLER.

(Continued from page 631)

ENDS FOR THE COILS

It is necessary now to cut a base end to fit the five inch primary coil and two for the four and one-half inch or secondary coil, from three-eighths inch wood (white pine may be used, as it is quite soft and easy to handle). When thus cut they are placed on top of each other and two one-eighth inch holes drilled about one and one-half inches apart and toward one end. They must, of course, be in alignment, as they are for the slider rods. The center must also be free as in one of the four and one-half inch covers fifteen holes are to be drilled for the fifteen secondary taps. The respective taps of the secondary are drawn thru in order and the ends nailed to the coil with brass nails. Care must be taken to get the openings for the sliders directly under each other. The completed secondary is shown at Fig. 4, and also the sliders and their arrangement. The sliders are made from No. 8 copper wire which is stretched taut by screws at the top of the cabinet. A screw eye is inserted into the top for varying the coupling, as will be described presently, and the primary is screwed in place (see Fig. 4).

THE CABINET

Very little need be said about the material for the cabinet, perhaps, as the building of this depends entirely upon the ways and means of the Amateur, so only the measurements will be given. The cabinet is made like a box except that the top and back are not put into place until the apparatus is mounted. The front panel is one-half inch thick, twenty-six inches high and eight and one-half inches wide (¼ inch Bakelite makes an excellent job); the sides are six inches wide.

SWITCHES, SWITCHPOINTS AND METHOD OF VARYING THE COUPLING

The switches were made at a cost of eight cents each, using also such odds and ends as are found in any laboratory. The knobs

The Electric Safety razor makes shaving a pleasure. Blade vibrating 7,200 times a minute cuts the beard smoothly and without slightest pull or irritation—feels like a gentle massage. Can be used with or without electric current.

All users of the **Lek-Tro-Shav** speak well of it.

A barber says—"Have shaved for years and have never used any shaving device near its equal."
A home user says—"The most pleasing shave I've ever had in my life. Shaves my face closer than I used to shave, but there is no after irritation or ill effects as I usually get from another razor."
No. 1 Made for use from Light Socket.
No. 2 Made for use from Dry Battery.
Write for illustrated circular describing Lek-Tro-Shav Safety Razor fully.

Learn Mechanical Drawing

Thousands of Draftsmen Wanted — Salaries $35-$100 Per Week

ARE you earning more than the average man? If not, my offer will interest you. I offer you the best service that my school affords. I offer you my personal instruction in mechanical drawing. I offer to teach you expert draftsmanship in your own home. I offer to fit you for the high-paying position of draftsman in one of the United States government departments or one of the great machine shops of America. I offer to do all this at a reasonable expense to you, and in a comparatively short time.

The drafting field is not crowded. It never was. It probably never will be. You cannot make a mistake by taking up draftsmanship. I do not know of any single profession open to men today which offers better opportunities. As I have said at the beginning of this article, draftsmen are earning $35 to $100 per week.

There is a demand for men who complete my course. I cannot supply graduates fast enough. Many of them are taken even before they complete their course. This unusual demand is explained by the fact that my students enter on actual drawing work the day they enroll with me. They spend no time with preparation and useless theory.

ONE OF THE FINEST AND BEST EQUIPPED INSTITUTIONS IN AMERICA TEACHES YOU MECHANICAL DRAWING AT YOUR HOME.

With the ending of the war, the day of big opportunities for trained men is here. Especially is this true in the case of draftsmen, on whom the mechanical industries of America depend. On no one profession does the reconstruction of Europe so nearly center.

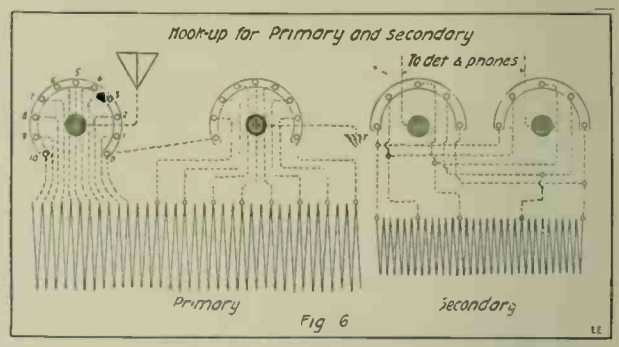
were purchased from a hardware store. These are glass drawer knobs and have a brass shell into which the glass knob is cemented; also a screw is fitted into the end. Five of these are needed. The switch blade is cut from a piece of springy brass or nickel. Cut two pieces three inches long and taper down one end (see Fig. 5). The other end must be made to fit the knob. A hole is drilled into this end and the blade is soldered to the brass cup; bend the contact end as shown. Also cut two pieces one and one-half inches long for the secondary switches and fasten in the same way and to the fifth knob solder the hand of a clock.

The switch points are common upholsterer's nails with the brass tops and small washers to fit the under side. After the wire has been drawn thru a hole drilled in the cabinet for it, it is twisted around the nail and the loop thus formed pushed far down into the hollow of the cup of the nail. A small amount of flux and a piece of solder about one-quarter the size of a split pea is placed into the cup which is held hollow upward. A hot iron is now touched to the nail, and the solder will melt flush and make an excellent connection. The washer is now slipt over the nail and the nail driven in place. The washers are not essential but make the heads of the switch point protrude more. (Fig. 5.)

The method of varying the coupling is by a cable and drum arrangement. Rack and pinion methods need accurate workmanship for them to operate correctly, so this novel home-made method was devised. After the clock hand has been soldered to No. 5 knob, a twenty-four inch (circumference) wooden wheel is fastened to the screw of this knob. This wheel is locked in place and a hearing is made to fit the other end of the screw, so that there will be a fairly good axle and bearings formed, one bearing being the front panel. A bent piece of brass will answer for the other end. A piece of leather is fastened in such a way as to cause friction against the wooden wheel. A piece of cord is nailed to the wheel and wound around the groove; the cord passing over a small pulley and secured to the screw-eye on the upper end of the secondary (see Fig. 4).



ASSEMBLY

Along the mid-line of the panel and four and eight inches up from the bottom, respectively, drill two holes to fit the screws of the switches. Above each of these drill two smaller holes for wires which will go to antenna and ground. Draw the flexible wires thru; solder to switch blade (Fig. 5) and put switch in place. Place a spring on the under side of switch to keep it tight. Describe an arc with each switch and using about two-thirds of a complete circle for the arrangement of switch points, divide them equally into the area thus allowed. Drill holes for the wires of the switch points, solder to switch points as already described and hammer into place. Then seventeen inches from the bottom and two inches from the mid-line each way, drill holes for the switches of the secondary. Mount the sixteen switch points in place as per diagram for connections.

Put the top on the cabinet with the bolts (eye-bolts) for slider rods and tighten the rods; finally put on back. The diagram of the assembled coil is shown in Fig. 7.

There are many advantages of this type cabinet, as it is both compact, inexpensive and neat. It does not allow dust to settle between the windings and prevents the entrance of other foreign matter. One complete turn of the coupling knob will change the coupling completely. Accurate tuning of the primary is worked out to a very fine extent and the novel arrangement of the secondary tuning will be seen to have many merits, as any portion of the coil may be used and the direction of current may also be reversed. Often the coupling will not have to be changed in order to vary the secondary, as both switches may be moved and so bring another portion of the coil into play.

With a galena detector stand and using a "radiocite" crystal, this outfit cannot be beaten and other stations were brought in that never were heard before. This may have been due to the excellency of the crystal, but the coil has something to do with it, in my estimation.

Hook-Up of Primary and Secondary Windings On Vertical Coupler. Note That Secondary Switching Circuit Permits of Reversing the Polarity of the Circuit.

SOLAR ENGINE USES SUN'S ENERGY.

(Continued from page 607)

Messrs. Shuman, Boys, and Ackerman, engineered and built a large solar energy plant at Meadi on the Nile, Egypt. This plant developed 100 h.p. The total area of sunshine collected was 13,269 square feet. The maximum pounds of steam generated was 12 pounds per 100 square feet of sunshine, or the equivalent, to *183 square feet per brake horsepower*. The best hour's run developed, at atmospheric pressure, 1,442 pounds of steam. Hence (allowing 22 pounds steam per brake horsepower) the maximum output for an hour was 55.5 horsepower (about ten times better than any previous results). This means *63 brake horsepower per acre of land occupied by the plant*. Moreover, no marked reduction in the horsepower produced was noticeable in the early hours of the morning or in the late hours of the afternoon.

The temperature of the sun, as aforementioned, has been calculated to be about 6,000 degrees centigrade. Several authorities point out that this terrific heat therefore precludes any possibility of the sun being a molten mass in the process of combustion. It has been thought recently by many to be a great mass of matter possessing to a remarkable degree radio-activity akin to radium. Helmholtz proposed that the sun could keep on producing energy at its present rate by accounting for same on the basis of a slight annual shrinkage in its size. From observations and measurements

www.americanradiohistory.com

of this heavenly body made from year to year it has been computed that the age of the sun would, on the shrinkage basis, be 17,000,000 years.

The radiant energy received from the sun at the outer surface of the earth's atmosphere is equivalent to *7,300 horsepower per acre.* Of this about 70 per cent. or, roughly speaking, 5,000 horsepower per acre, is transmitted thru the atmosphere to the land surface proper of the earth, at noon on a clear day. Lesser amounts, of course, are received in the early morning and late afternoon, owing to the greater thickness thru which the energy must pass.

Relative to the basis upon which solar energy is calculated for the earth's surface, this is generally made, it may be said, on the "solar constant," as it is termed, ascertained from 696 tests conducted by the Smithsonian Institute of Washington, in various parts of the world, which resulted in accepting 1.93 calories per square centimeter per minute, equal to *7.12 British thermal units per square foot per minute.* This is an average value, all things considered.

Only about three-fifths of the solar radiation produce any impression on the earth, and it is only the radiant energy which falls on some material body that is converted into heat. The best body for this conversion having been ascertained to be a dead black one.

"ODD PHOTO" CONTEST.

(*Continued from page* 616)

as to work the strings. Fourthly, it was indoors on a cloudy day. I simply guest at the time—about 25 seconds for each exposure (double exposure) and let 'er go at that. The streaks are the strings; the lenses were between the two strings. I didn't expect it to be any good at all. So if you have any extra dollars flying around, send one out to Iowa. Fred Wagner,
Burlington, Iowa.

NOVEL PHOTO OF CITY AND LIGHTNING AT NIGHT.

The photo I submit is a picture of a city at night, taken from a high mountain nearby. The object of taking the picture was to "snap" the lightning.

Rob't Sullivan, Canon City, Colo.

AT LAST—A PHOTO OF "BALL LIGHTNING."

Speaking of "Odd Photos" or something for the "bug" to worry about, I think I have it here, in the form of two actual photographs, either of which contain any kind of lightning one would want, i.e., *chain, ribbon* or *ball.*

These photos were taken about six months ago (Pardon the selfishness) on the same night and about five minutes apart, during a very damaging electrical disturbance in this locality.

I may be wrong in my conception of the impression on the right side of photo No. 1 (the upper left photo) being *ball lightning,* but would suppose it to be such. This picture is an exposure of 30 seconds. There was no artificial light of any kind in front of the camera. This phenomenon was not perceptible to the eye—or at least was not observed.

If this be ball lightning we then know that ball lightning is of an oscillating or pulsating nature, as is evident from the path taken by the ball. Possibly this is a potential of one sign seeking its affinity or opposite potential sign, in order that it may neutralize. Following the path of the ball it comes in at the base of the ribbon discharge at the left, whence it travels straight across, almost parallel to the wires in the background, then it comes to rest in the upper right hand corner. It now slowly follows an irregular path with a few stops and makes its exit into the heavens, no doubt to join its patiently waiting other half.

Photo No. 2 (lower center) is a 3 minute exposure, during which time the camera was moved once but very slightly, as you see from the double print of the chimneys in the background. In this picture will be seen innumerable paths of the light ball where it has traveled at various speeds.

L. E. Church, Bailesville, Okla.

EXPERIMENTS IN RADIO-ACTIVITY.

(*Continued from page* 636)

radio-active study. It is thought unnecessary here to give further experiments in this phase of the subject as they will suggest themselves to the reader. It is an intensely interesting subject and the reader will derive both beneficial knowledge and pleasure from his experiments. There are many other properties of these substances besides their ionizing power which will be taken up in later articles.

(*To be continued*)

BUILDING A 3-INCH SPARK STATIC MACHINE.

(*Continued from page* 633)

should reach the comb and thus prevent the escape of the electricity before it reaches the metal points.

An iron ring placed on the conductor heightens its capacity. This consists of an iron wire bent in a circle and then well insulated with paper, which is later varnished with shellac.

If the handle of the machine is turned towards the combs, electric sparks can be drawn from the small ball attached to the end of the brass wire holding the comb.

It is unnecessary to explain the uses of Leyden jars and other apparatus which can be used in connection with this machine, as any "Physics book," under the heading of "Electricity," describes a number of them.

THE CITY OF SPLENDID NIGHT.

(*Continued from page* 623)

footed torch-bearers led the way. None of them, proud souls, ever saw their doorways in fullest beauty, the beauty that is electric, that softens rude prominences while it throws a lustrous, enchanting glow over fine design and decoration.

The "City of Splendid Night" forever calls me to fresh delights. I go the way of a side street at the beckon of a light and, anon, find myself before the stately pile of a church, mirrored against the sky by the guardian pillar of radiance that stands before it. Later I come upon a green park bordered with electric jewels. Here I seat myself and watch the trees play tag with beams of electric brilliance.

Big Money for Boys!

Learn ELECTRICITY

There is a wonderful opportunity right now for boys who like electricity. Thousands of men from the electrical industry have gone into the service and others are going every day. Boys who are ambitious and will train themselves in spare time can step into good positions and play a real part in winning the war by carrying on their work. Good salaries are offered with rapid promotion.

For 27 years the International Correspondence Schools have been training boys for success in electricity and over 200 other subjects. They will help you prepare right at home for a position in the line of electrical work you like best—or in any other work that appeals to you. Thousands of boys, through I. C. S. training, have stepped into fine jobs, but never were opportunities so great as now.

Let the I. C. S. help *you.* Choose the work you like best in the coupon below, then mark and mail it today. This doesn't obligate you in the least, and it will bring you information that may start you on a successful career. This is your chance. Don't let it slip by. Mark and mail this coupon *now.*

You may know the white lights of the night, so do I, but I also know where are to be found those more precious sights of the city, made possible by night and electricity. And so I wander lovingly thru the "City of Splendid Night," and visit its shimmering shrines.

The Park at Night

WHEN next you walk abroad at night, choose Central Park, and preferably that part of it which ranges south of Seventieth Street. Enter to the left of General Sherman and follow the friendly bypath that skirts the Japanese Lake, where the swan boats ride at anchor. I call it the "Japanese Lake" because the first sight of it, thru certain trees bent and burdened with weird charm, suggests a Japanese print, wherein the towering Plaza becomes Fujiyama. The while you stand the lake gathers lustre from many sources, taking toll of light until its tiny, radiant body seems a great, luminous tear, dropt from the eye of God.

You can't know Central Park until you see it at night, and then it is no more the park than the city surrounding it that thralls you. Each season has its own particular charms; but it is best to consult your almanac prior to making the excursion, for no moon is wanted at such a time. The lights of Manhattan should not be disturbed, or marred, and a cloudy night, tho with rain yet a long way off, is to be especially desired.

In truth some of the rarest charms of this great enclosure are the vantage points it offers for viewing the glowing city. From each hill and hollow and rustic bridge you see sights that make you feel Nature has prepared a wonderful gallery in which you may stand and see the thousand pictures painted by Night and Electricity.

And the wonder of the lighting. Never have pictures been hung for exhibition with more rare understanding of the art of presentation. Never has favored critic at private view found color and arrangement, composition and subject, more effectively displayed than finds he who will be guest of Central Park as he stands witness to the glory of Manhattan.

Off to the South and West flare great electric signs surmounting high buildings. Warm and colorful they hang in the sky; aerie, detached beacons of fantastic shape, winking at the night and rippling thru darkness. Rows of lighted windows speak cheerfully of life. From the summit of a tiny hill streaking traffic is visible in its shooting rays of warning speed.

Within the sylvan solitude the voice of the city speaks faintly, and its sparkling eyes are veiled with the romance of contrast, that ever comes when Nature spreads her green mantle in the midst of man's activities.

Oh, the wonder of the city from the park; and then the wonder of the park within the city. Here Robin Hood might dwell and Peter Pan feel a charm as luring as his finest scenes in Kensington Gardens.

If you would really see all the spirits of the wood gathered together in carnival, then stand at the Northern limits of the Mall and, half closing your eyes and rising on tiptoe, look down its length. Fill yourself with the full beauty of the fairy court. It is precisely lighted with soft, glowing globes. Here and there stand set pieces of statuary, grotesquely gigantic, forever trying in their rigid way to cast strange shadows for each competing light that falls on them from either side and from across the Mall's milky way.

As sure as you believe in fairies, they are here. Some lurking behind these statues, snuggled in the robust curves of back and base. All waiting in thrilling expectancy their turns to dance and frolic in the silvery glow. The scene will surely enchant you. Earth-weight passes, the senses are ethereally acute, you feel the pulse of Beauty, and the heart within you takes fire.

So lives the radiant poetry of Central Park. It is there for all of you who will go with vision for its picturing. It is the great gallery exhibiting the Light of Manhattan.

New York in the Rain.

BLOT out the stars. Draw a leaden mantle of cloud across the heavens. Let the skies open every pore, until earth rejects the surfeiting torrents. Fields are sodden, woods sullen, villages sordid, and all the open country a sticky mass of morbid moisture.

But old New Amsterdam is glorious!

So fare you forth and witness the wonders of this city of cities in the rain. The perfect time is during the first silent hours of the morning. Then you may surprise it in the full splendor of its bath. The buildings stand stark, dripping, and in great masses rise triumphant thru the drenching.

The gutters are long panels of flowing mirrors which break and shatter into ten million fractions in reflections, where treacherous corner grills suck them into roaring depths. About each light that punctuates the avenues and streets there is a hazy glow. Here sparkle the jewels thrown overboard by the clouds in an effort to lighten their ballast.

As tho hoisting themselves on the liquid ladder of the storm, the ascending mingled lights of the city burnish the grey vault above with golden copper, as the hearth-flames picture themselves in the kettle swinging from the crane.

The romance of *Masonry* and *Electricity* is before you. It is a drama done in pouring pantomime. The scenery is made of steel and stone, with all the city on the stage. Footlights and spotlights get their life from giant dynamos and turbines swiftly milling greater light than Nero made when sacrificing Rome.

Now pause, while the clouds are discharging their cargoes; if you will halt between tall buildings and bear your face to the rain for a full upward glance you will know somewhat of the feeling of the mountain traveller when he stands in the spray of some vast waterfall. Deep down in the cañon he pauses while the rays of an unseen sun paint a rainbow on the struggling torrent at the spot where the unleashed waters hurl themselves from the cold embrace of the rocky heights.

Again you stand before great arches opening into the halls of commerce and mark the silent sentinels picking luminous arcs out of the night and rain and sending many-colored reflections into the shadowed recesses as fire-brands challenge the darkness of some echoing cave.

So we see the many-sided city at its bath. The city that has been the sweetheart of an endless procession of goodly men. The city of which O. Henry sang so sweetly and of which he wrote so understandingly. Great is Diana of the Madison Square Campanile. Great is the Lady of Liberty Light. But greater still is the city over which they reign.

When storm breaks at night Manhattan blooms: she blossoms gorgeously in the downpour, and bathes majestically. And so, when drenching clouds cut off our view of the campfires of the guardsmen of the heavens, we feel an increased thrill in the shining of our faithful keepers of the curb, the stars of the street.

MAGAZINES GOING UP!

Further Increases Coming!

NOW IS YOUR CHANCE!

With this issue, the price of the EXPERIMENTER, as announced on another page, goes to $2.00 a year. With the paper market in chaos and soaring prices, printers demanding another large wage increase, engravings going up 90%, we feel sure that before spring ALL magazines will go much higher than now.

By subscribing now for from one to five years, YOU POSITIVELY WILL SAVE BIG MONEY.

The prices below are unquestionably the lowest for standard magazines that it is possible to obtain anywhere. Only by a special arrangement with the publishers are these prices possible and they are good only until December 15th, after which date all prices as given on this page are withdrawn. Make up your list at once—do not delay. If you are already a subscriber and your subscription to the EXPERIMENTER runs for a long time, you may subscribe for any other magazines by deducting the price of the EXPERIMENTER from the clubs at the rate of $1.85 (the special price allowed in clubbing with other magazines). Thus you can make up any club yourself of as many magazines as you wish from the list below.

The Publishers Will Mail the Magazine Direct From Their Own Office to You

All prices quoted are for subscribers in U. S. only. Canadian and foreign subscriptions require additional postage.

Charlotte, N. C.
Oct. 4, 1918.

Electrical Experimenter Pub. Co.,
233 Fulton St., New York.

Dear Sirs:

It certainly was SOME RESULTS.
I've almost worn out a good typewriter.
Just about exhausted myself writing.
Used all the paper in this part of America.
And about "Gone Busted" buying postage stamps.

Now, I'm a-goina quit, and will never do it again, or at least I won't promise to answer all the letters I received from an Ad that I put in the "E. E."

The letters are still coming in.—The apparatus advertised has long since been sold. Every piece of it. The letters are from all over the United States, AND ELSEWHERE. Received one today from Shanghai, China. Can you beat that. I'm enclosing the letter from China.

It's a great life, if you don't weaken.

I wish to THANK the "E. E."—Some circulation.

Very Respectfully,
G. R. SMATHERS,
403 N. Brevard St., Charlotte, N. C.

CORE WIRE

We have been fortunate in securing thru auction several tons of guaranteed pure, double annealed Norway Iron Core Wire and are selling this wire to "Experimenter" readers

AT PRE-WAR PRICES 20cts LB.

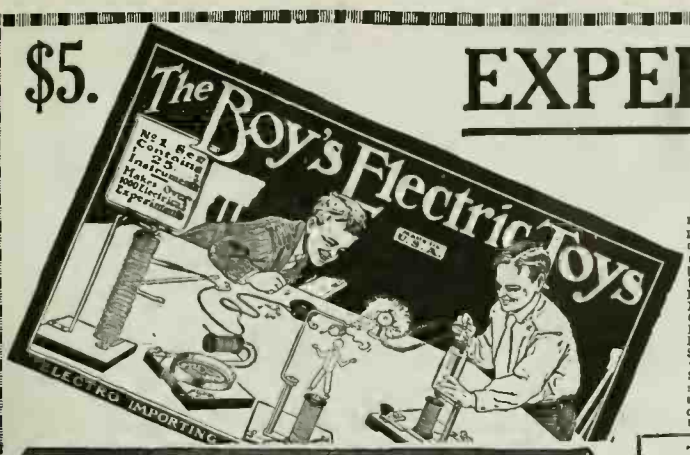
This wire is just the thing for spark coils, transformers, etc., and it is, of course, a very much more superior product than the usual iron wire. We absolutely guarantee the quality.

If you ever thought of building a spark coil, transformer, or similar apparatus, now is the chance to get the right material for it. As far as we know this is the only lot of Iron Norway Core Wire in the hands of any dealer at the present time, and none can be gotten until after the war.

We have only two sizes left:

26 INCHES **36 INCHES**

Thickness about No. 21 B and S



If either of these sizes should be too long we advise cutting the wire down yourself by means of shears. It will pay you to do so as real Norway Iron Wire, sold by a few dealers last year, brought from 40c to 50c a pound. American core wire now sells for from 30c upwards per pound.

As long as the supply lasts we offer this wire as described above to our customers at the very low price of 20c a pound. Order at once.

ELECTRO IMPORTING CO., 231 Fulton St., N. Y. C.

$5. EXPERIMENTERS!

No. EX2002

"THE BOY'S ELECTRIC TOYS" contains enough material TO MAKE AND COMPLETE OVER TWENTY-FIVE DIFFERENT ELECTRICAL APPARATUS without any other tools, except a screw-driver furnished with the outfit. The box contains the following complete instruments and apparatus which are already assembled:

Student's chromic plunge battery, compass-galvanometer, solenoid, telephone receiver, electric lamp. Enough various parts, wire, etc., are furnished to make the following apparatus:

Electromagnet, electric cannon, magnetic pictures, dancing spiral, electric hammer, galvanometer, voltmeter, hook for telephone receiver, condenser, sensitive microphone, short distance wireless telephone, test storage battery, shocking coil, complete telegraph set, electric riveting machine, electric buzzer, dancing fishes, singing telephone, mysterious dancing man, electric jumping jack, magnetic geometric figures, rheostat, erratic pendulum, electric butterfly, thermo electric motor, visual telegraph, etc., etc.

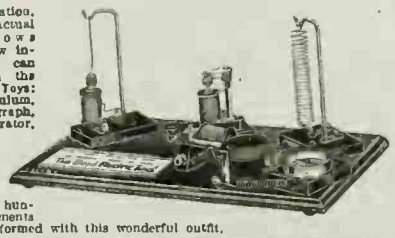
This does not by any means exhaust the list, but a great many more apparatus can be built actually and effectually.

With the instruction book which we furnish, one hundred experiments that can be made with this outfit are listed, nearly all of these being illustrated with superb illustrations. No other materials, goods or supplies are necessary to perform any of the one hundred experiments or to make any of the 25 apparatus. Everything can be constructed and accomplished by means of this outfit, two hands, and a screw-driver.

The outfit contains 114 separate pieces of material and 24 pieces of finished articles ready to use at once.

Among the finished material the following parts are included: Chromic salts for battery, lamp socket, bottle of mercury, core wire (two different lengths), a bottle of iron filings, three spools of wire, carbons, a quantity of machine screws, flexible cord, two wood bases, glass plate, paraffine paper, binding posts, screw-driver, etc., etc. The instruction book is so clear that anyone can make the apparatus without trouble, and besides a section of the instruction book is taken up with the fundamentals of electricity to acquaint the layman with all important facts in electricity in a simple manner.

We guarantee satisfaction.



The size over all of the outfit is 14 x 9 x 2¾. Shipping weight, 8 lbs. **$5.00**

ELECTRO IMPORTING CO., 231 Fulton St. NEW YORK

A Sample of What You Can Do With This Outfit

This illustration, made from an actual photograph, shows only a very few instruments that can be made with the Boy's Electric Toys: Electric Pendulum, Electric Telegraph, Current Generator, Electric Dancing Spiral, Galvanometer. Space does not permit us to show the hundreds of experiments that can be performed with this wonderful outfit.

The "Electro" Radiotone

HIGH FREQUENCY SILENT TEST BUZZER

This instrument gives a wonderful high pitched MUSICAL NOTE in the receivers, impossible to obtain with the ordinary test buzzer. The RADIOTONE is built along entirely new lines; it is NOT an ordinary buzzer, reconstructed in some manner. The RADIOTONE has a single fine steel reed vibrating at a remarkably high speed, adjusted to its most efficient frequency at the factory. Hard silver contacts are used to make the instrument last practically forever.

Yes, the RADIOTONE is SILENT. In fact, it is so silent that you must place your ear on top of it to hear its beautiful musical note.

You will be astounded at the wonderfully clear, 500 cycle note, sounding sharply in your receivers. **To learn the codes, there is absolutely nothing like it.** With the radiotone, a key and one dry cell and ANY telephone, a fine learner's set is had. Two or more such sets in series will afford no end of pleasure for intercommunication work. Shipping Weight 1 lb.

Radiotone as described.....each **$.90**

IMMEDIATE SHIPMENTS

The "Electro" Telegraph

is not a toy, but a practical, honestly built telegraph outfit, which not only sounds but works like the big commercial instruments. By studying the code for 30 days you can become a first-class telegraph operator. Such operators are in big demand now. Outfit consists of TWO complete telegraph instruments each measuring 3½ x 2½ x 2¾. All metal parts are highly nickel plated, including key lever. Note hard rubber knob. Telegraph Code Chart, telegraph blanks and connecting wire comes with set, but no batteries. Outfit works on 2 dry cells (one cell for each instrument). The "Electro" is the ONLY outfit that works both ways, each station can call; no switches, no extras. Nothing to get out of order. Guaranteed to please you or money back. Price Complete as illustrated (TWO INSTRUMENTS).. **$1.25**

Shipping Weight, 2 lbs.

IMMEDIATE SHIPMENTS

The "Electro" Codophone (*Patents Pending*)

$1.50

What this remarkable instrument is and does.

The "Electro" Codophone is positively the only instrument made that will imitate a 500 cycle note exactly as heard in a Wireless receiver. The loud-talking receiver equipped with a horn, talks so loud that you can hear the sound all over the room, even if there is a lot of other noise.

THAT'S NOT ALL. By lessening or tightening the receiver cap, a tone from the lowest, softest quality, up to the loudest and highest screaming sound can be had in a few seconds.

FOR INTERCOMMUNICATION. Using two dry cells for each instrument, two Codophones when connected with one wire and return ground, can be used for intercommunication between two houses one-half mile apart.

One outfit alone replaces the old-fashioned learner's telegraph set, consisting of key and sounder.

The "Electro" Codophone is a handsome, well made instrument, fool proof, and built for hard work. Contacts are of hard silver ⅛ inch in diameter, that will outlast the instrument.

There is also a neat code chart and full directions enabling any intelligent young man or girl to learn the codes within 30 days, practising one-half hour a day.

Size: 6¾ x 3 x 2¾". Shipping weight, 2 lbs. The "Electro" Codophone as described, complete..... **$1.50**

"The Livest Catalog in America"

Our big, new electrical cyclopedia No. 19 is waiting for you. Positively the most complete Wireless and electrical catalog in print today. 228 Big Pages, 600 illustrations, 500 instruments and apparatus, etc. Big "Treatise on Wireless Telegraphy." 20 FREE coupons for our 160-page FREE Wireless Course in 20 lessons. "The Baby" Double Action Hammerless Revolver

A HANDSOME AND MOST EFFECTIVE WEAPON

$5.50

Measures but 4¾ inches long

Takes regular .22 calibre cartridges

The new Baby Double Action Hammerless Revolver has been produced to meet the ever increasing demand for a revolver that would combine small size and light weight with the essential features of Efficiency and Practicability. It is small in size, yet is just as effective and reliable as the more expensive weapon you can buy. Every lady should have a revolver and should know how to use it, and there is no safer or better one made than this. A great feature is its safety action that guards against accidental discharge, making it quite safe for young men and ladies. The illustration gives an idea of its appearance, but it must be seen and used to be thoroughly appreciated. The ammunition used is the standard .22-calibre (short) cartridge obtainable anywhere, or you may obtain the cartridges from us (cartridges can be shipped only by express). The revolver is fine six shots in one loading. The operation of the charging mechanism is extremely rapid and absolutely reliable; all well aimed shots can be fired in as many seconds. The revolver is very well constructed, with finest nickel plated fluted barrel of cylinder, and it weighs only 4½ ounces. **The Price of the Baby Revolver is only $5.50, sent by mail postpaid to any address.** JOHNSON SMITH & CO.

JOHNSON SMITH & CO., Dept. E2 54 W. Lake St., CHICAGO

Trim Your Own Hair With the Utility Safety Hair Cutter

Cuts the Hair Any Length, Short or Long—Saves Its Cost First Time Used.

PRICE ONLY 35c POSTPAID. EXTRA BLADES 35c EACH.

If you can COMB your hair you can TRIM your own hair with this marvelous invention. The UTILITY TRIMMER will cut hair any length you desire, short or long, finish the job as nicely as any barber and in one-fourth the time before your own mirror. The ladies can cut the children's hair at home in a jiffy, or can be used as an ordinary razor to shave the face or finish around the temples and neck. Sharpened like any razor; can be carried in the vest pocket ready for instant use and will last a lifetime.

To use it, stand in front of a mirror, if necessary, and use the UTILITY TRIMMER like you would a comb. Push it through the hair, downward, in the direction the hair lies, but Never Upward.

To cut long hair, first moisten the hair and comb it, so it will be close to the head, then start cutting with downward cuts as high as you desire, evenly all around the head. Shave the neck and temples with a square cut, like a barber.

To cut very close, push the blade until the "cut steps" in your hair with this device, as the handle guard guides the cutter blade evenly over the scalp.

To cut very close, push the blade until the cutting edge is even with the guard teeth.

To shave the face or neck it can be used as an ordinary razor by reversing the blade in the holder, the cutting edge being to the back of the holder, exposing the entire blade, except each corner.

To hone, place the blade in the holder, with the cutting edge to the back, moving the blade out until the cutting edge is clear of the back of the holder. Then hone in the usual manner, the same as with an ordinary razor.

JOHNSON SMITH & CO., Dept. E2 54 W. Lake St., CHICAGO

The CONJURER'S CASKET

Apparatus and Directions for a Number of Mysterious Tricks Enough for an Entire Evening's Entertainment

ANYONE CAN DO THEM. PRICE 50c POSTPAID

Get this Conjurer's Cabinet. It contains the apparatus for seven first-rate tricks, including The Disappearing Rose, that, when placed on the lapel of your coat, vanishes from sight at will; the Magic Vase and Ball Trick in Wooden Ball is placed inside, and upon replacing the ball has disappeared and is found in someone else's pocket; The Magic Nail with which you can apparently cut your finger almost in two; the Wonderful Card Trick in card is placed in an envelope, and when opened an entirely different card altogether is found; The Disappearing Coin Box in coin is placed in the little wooden barrel and when opened again, is found to have vanished entirely or can be made to change into a coin of another denomination; The Famous Mesmerized Penny test defies the law of gravitation suspends from the palm of the hand, nose, cheek, wall, clothing etc.; The Genii Goblet and Vanishing Coin Trick (a coin is dropped into a glass of water, and when the water is poured out the coin has vanished). Full printed instructions for performing each trick. Besides the tricks contained in the Casket, there are twenty-five other tests and illusions fully explained with full printed instructions, for which you can easily make or procure the necessary apparatus. We also send the secret of performing five wonderful stage tricks

JOHNSON SMITH & CO., Dept. E2 54 W. Lake St., CHICAGO

New Vamping Card

PIANO PLAYING MADE EASY

No Teacher Needed Surprisingly Simple System

Persons having neglected their Musical Education need not despair, for with the aid of our new VAMPING CARD (placing the card upright over the piano keys), you can at once Vamp any of Songs, Ballads, Waltzes, Rag Time, etc., etc., equal to a Professional Musician. No knowledge of music is required. After using it a few times, you will be able to vamp with the best of them. The Card entirely Only 10 cts. p. pd. Johnson Smith & Co., Dept. E2 54 W. Lake St., Chicago

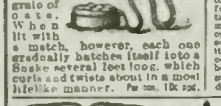
Sneezing Powder

Place a very small amount of this powder on the back of your hand and blow it into the air, and everyone in the room or car will begin to sneeze without knowing the reason why. It is most amusing to hear their remarks, as they never suspect the real source, but think they have caught it some from the other. Between the laughing and sneezing you yourself will be having the time of your parties, political meetings, car rides, or any place at all where there is a gathering of people. It is the greatest joke out. Price 12c or 3 for 30c.

JOHNSON SMITH & CO.

STAGE MONEY

With a bunch of these bills, it is easy for each person to have a roll to appear prosperous. By flashing a roll of these bills at the proper time and getting off a genuine bill or two from the outside of the roll, the effect created will be found to be of the most splendid. Prices, postpaid: 15 Bills 10c, 50 Bills 25c, 125 for 50c, or $3.50 thousand.



Serpent's Eggs

Each box contains 12 eggs, which are no larger than a grain of oats. When lit with a match, however, each one gradually hatches itself into a Snake several feet long. Which curls and twists about in a most lifelike manner. Per box, 10c ppd.

Mystic Skeleton

10c ppd.

A jointed figure of a skeleton, which in its height, will dance to music and perform various gyrations and movements while the operator may be some distance from it. Simply place on a chair or table it will seemingly become endowed with life and begin to move. At command of operator will lie down, stand up, dance, etc. J. S. & CO.

MUSICAL KAZOO

With the Musical Kazoo you can, without previous practice whatsoever, play any tune right off, imitate any bird or animal, operate snare drum, Punch and Judy, etc. No holes to finger. It is simplicity itself. Produces a perfect music, but you do not blow into it, but sing, speak, laugh or make any desired imitation. Used with genius while the operator is seemingly playing a comb, in church entertainments, dances, serenades, picnics, outings, excursions. Just the thing for choruses and shows, bicycle and marching clubs, etc. Excellent for vocal or instrumental accompaniments, either with or without other musical instruments. Price 15c. pd.

MAGIC FLUTE

Wonderfully Sweet Toned and Musical

A marvelous musical instrument. No other instrument produces sweeter music. Whether it be the joyous notes of a quickstep or the solemn strains of a church hymn—in fact, any class of music can be played upon the Humanatone without practice, as it is almost a self-playing instrument. When played with a piano accompaniment, or any other musical instrument, the effect is charming. Full printed instructions for playing sent with each instrument.

Post Paid 15c

A Great Curiosity

Midget Illustrated Bible

The Smallest Bible in the World

The Midget Bible is a perfect gem, and a work of art. It is about the size of a postage stamp and contains TWO HUNDRED AND FIFTY PAGES of the NEW TESTAMENT, profusely illustrated. This little Bible is a wonder. It is said to bring good luck to the owner. Must be seen to be appreciated. Price, only 15 cents, three Bibles for 30 cents; one dozen Bibles for $1.00 or 100 for $8.00. Good money can be made selling these Midget Bibles among retail trade, church organizations. Sunday schools, etc. Send for wholesale terms and trial offer.

JOHNSON SMITH & CO., Dept. E2 54 W. Lake St., CHICAGO

CIGARETTE ROLLER

Very neat and handy. Weighs less than a quarter of an ounce. It makes better cigarettes than you can buy and makes them really and quickly. You can use all the tobacco you prefer and thus have nicer "smokes" than ready-made, and more of them, besides saving about half of your money. Just try one and make your cigarettes just to your own liking. Price only 10c or 3 for 25c postpaid, with full instructions for use.

JOHNSON SMITH & CO., Dept. E2, 54 W. Lake St., CHICAGO

Thumb Brander

NEW & NOVEL JOKE

to play on your friends. Place on your thumb, and "brand" your victims as you shake hands. Great fun. Won't wash off very easily, either. Any of these choice symbols: Owl, fool, ass, grouch, baby, lightning, hot air, bull. Safety Fluid. Complete with pad and ink, 15c (post 2c). Any other brand made to order 25c.

INKLESS PEN

WRITES with WATER 600 words every time you dip. Makes its own ink. Writes fashionable violet color. Better and cheaper than fountain pens. Writes a fine letter with one dip in plain water. No trouble—no bother—no mess. A pleasure to use. With Nickel Plated Reversible Holder 10 CENTS. 3 for 25c postpaid. Extra Points 5c, 6 for 25c.

Latest Novelty: Aerial Balloon

Flies gracefully in or outdoors. VERY LATEST SENSATION IN BALLOONS. A brightly colored balloon that measures sixteen inches long is blown up in the usual way, and, when released, the air escaping sends the balloon SOARING UPWARD, the 8½-inch propeller SPINNING AROUND AT A LIVELY RATE. The effect is startling. It is a graceful flier that makes the possessors WILD WITH JOY. May be used repeatedly indoors or outdoors. An immensely interesting toy. Price 10c each, 2 for 25c pd. Johnson Smith & Co., Dept. E2 54 W. Lake St., Chicago

LUMINOUS PAINT

Make Your Watches, Clocks, Etc., Visible by Night

The very latest discovery in the scientific world. Hitherto, practically unobtainable except at an exorbitant price, we have at last succeeded in producing this remarkable LUMINOUS PAINT, which, obtained from the surface of any article, emits rays of white light, rendering it partially visible in the dark. THE DARKER THE NIGHT, THE MORE BRILLIANT IT SHINES. Quite simple to use. Anyone—you can do it. A little applied to the dial of your watch or clock will enable you to tell the time by the light. You can locate the push buttons or switch plates of your electric lights, match boxes, and innumerable other articles; make your own Luminous Signs, Luminous Numbers, Luminous Rosaries, etc. Quite enough sufficient to cover several small articles. Price 25c. Larger sizes 50c and $1 postpaid. Johnson Smith & Co., Dept. E2 54 W. Lake St., Chicago

Every Electrical Man Wants These Books and we ship them for your inspection FREE

Flexible Covers — Handy Pocket-Size Volumes

10 Volumes — 3500 Pages — 4700 Pictures

$1 Per Volume

$1 Per Month

Just what you need to know to succeed in ELECTRICITY

EVERY electrician, every engineer, every mechanic should know about these wonderfully helpful instructive books, which give in plain words a complete working knowledge of electrical engineering in all its phases.

You run into some new electrical problem almost every day. The information you need to help you in your every day work is in

HAWKINS ELECTRICAL GUIDES

These books place electricity at your finger ends. They cover every imaginable subject, principle, theory, problem, trouble, and way of doing things electrically. Every subject is indexed so that you can turn right to it. They are a study course and a reference guide in one, written in plain every day language—no wasted words—only what you need to know—chock full of up-to-the-minute electrical knowledge. The guides are a complete course in electrical engineering. They will help you in every detail of the day's electrical work. You can't ask an electrical question that Hawkins Guides can't answer.

What Electrical Men Say

Helped Him Make Good

"It is only right for me to recommend highly the Hawkins Guides, for they have been of the greatest assistance to me in placing me in my present position as Superintendent of Construction Department of one of Ohio's largest Electrical Companies. I would like to see every man have a set of Hawkins Guides."
Geo. Knecht. Columbus, Ohio.

In the Naval Electrical Dept.

"The Hawkins Guides are great help to me in the Naval Electrical Department, which they cover very thoroughly."
C. J. Cornell.
U. S. Receiving Ship, Brooklyn, N. Y.

Superintendent

"I am now superintendent of the Dunnville Hydro-Electric Systems, and Hawkins Guides were a great help to me in holding down a responsible position."
W. E. Swartz, Dunnville, Ontario.

Wireless Operators

"I have worked wireless for ten years—but I wish I had these books years ago, as they have saved me a great deal of trouble." H. Marshall.
Steamer M & B No. 2.
Walkerville, Ont.

Pocket-Size Flexible Covers

The books are small enough to slip into your coat pocket—handsomely bound in flexible black covers.

You can carry each volume with you until you have mastered its contents. 3,500 pages of actual information and 4,700 illustrations. Once you see these books and put them into actual use you will never again want to be without them. Try it at our expense.

SEND NO MONEY

It will cost you nothing to receive these books—to look them over—ask them all the questions you can think of—use them in your work—study them—pick up some information that will increase your earning ability. We will ship you the entire set of 10 volumes entirely FREE.

This is a sign of our confidence in the guides. Pure gold does not object to being tested. Keep them for seven days and if you do not decide that you can't get along without them, return them to us and owe us nothing.

When you decide to keep them you only have to pay $1.00 down and remit the balance of $9.00 on the easy payment of $1.00 a month till paid for.

Use this coupon to get the books. It will pay you many times over.

READ THIS PARTIAL LIST OF CONTENTS

No. 1 Contains 348 pages, 388 illustrations. Electrical signs and symbols—static and current electricity—primary cells—conductors and insulators—resistance and conductivity—magnetism—induction coils—dynamo principles—classes of dynamos—armatures—windings—commutation—brushes, etc.

No. 2 Contains 342 pages, 394 illustrations. Motor principles—armature reaction—motor starting—calculations—brake horsepower—selection and installation of dynamos and motors—galvanometers—standard cells—current measurement—resistance measurement—voltmeters—wattmeters—watt hour meters—operation of dynamos—operation of motors, etc.

No. 3 Contains 300 pages, 423 illustrations. Distribution systems—wires and wire calculations—inside, outside and underground wiring—sign flashers—lightning protection—rectifiers—storage battery systems, etc.

No. 4 Contains 270 pages, 379 illustrations. Alternating current principles—alternating current diagrams—the power factor—alternator principles—alternator construction—windings, etc.

No. 5 Contains 320 pages, 614 illustrations. A. C. Motors—synchronous and induction motor principles—A. C. commutator motors—induction motors, transformers: losses, construction, connections, tests—converters—rectifiers, etc.

No. 6 Contains 298 pages, 472 illustrations. Alternating current systems—switching devices—circuit breakers—relays—lightning protector apparatus—regulating devices—synchronous condensers—indicating devices—meters—power factor indicators—wave form measurement—switch boards, etc.

No. 7 Contains 316 pages, 379 illustrations. Alternating current, wiring power stations—turbines; management, selection, location, erection, testing, running, care and repair—telephones, etc.

No. 8 Contains 332 pages, 436 illustrations. Telegraph—simultaneous telegraphy and telephony—wireless—electric bells—electric lighting—photometry, etc.

No. 9 Contains 322 pages, 627 illustrations. Electric railways—electric locomotives—car lighting—trolley car operation—miscellaneous applications—motion pictures—gas engine ignition—automobile self-starters and lighting systems, electric vehicles, etc.

No. 10 Contains 513 pages, 599 illustrations. Elevators—cranes—pumps—air compressors—electric heating—electric welding—soldering and brazing—industrial electrolysis—electro plating—electro-therapeutic—X-rays, etc.

Also a complete 126-page ready reference index of the complete library. This index has been planned to render easily accessible all the vast information contained in the 10 electrical guides. There are over 13,500 cross references. You find what you want to know instantly.

These Are The Hours That Count

MOST of your time is mortgaged to work, meals and sleep. But the hours after supper are *yours*, and your whole future depends on how you spend them. You can fritter them away on profitless pleasure, or you can make those hours bring you position, money, power, *real success* in life. Thousands of splendid, good-paying positions are waiting in every field of work for men *trained to fill them*. There is a big job waiting for *you*—in your present work or any line you choose. Get ready for it! You can do it without losing a minute from work or a wink of sleep, without hurrying a single meal, and with plenty of time left for recreation. You can do it in one hour after supper each night, right at home, through the International Correspondence Schools.

Yes—You Can Win Success In an Hour a Day

Hundreds of thousands have proved it. The designer of the Packard Twin Six and hundreds of other Engineers, climbed to success through I.C.S. help. The builder of the great Equitable Building, and hundreds of Architects and Contractors, won their way to the top through I.C.S. spare-time study. Many of this country's foremost Advertising and Sales Managers prepared for their present positions in spare hours under I.C.S. instruction.

For 26 years men in offices, stores, shops, factories, mines, railroads—in every line of technical and commercial work—have been winning promotion and increased salaries through the I.C.S. Over 100,000 men are getting ready *right now* in the I.C.S. way for the bigger jobs ahead.

Your Chance Is Here!

No matter where you live, the I.C.S. will come to *you*. No matter what your handicaps, or how small your means, we have a plan to meet your circumstances. No matter how limited your previous education, the simply written, wonderfully illustrated I.C.S. textbooks make it easy to learn. No matter what career you may choose, some one of the 280 I.C.S. Courses will surely suit your needs.

Make Your Start Now!

When everything has been made easy for you—when one hour a day spent with the I.C.S. in the quiet of your own home will bring you a bigger income, more comforts, more pleasures, all that success means, can you afford to let another single priceless hour of spare time go to waste? Make your start right now! This is all we ask: Without cost, without obligating yourself in any way, put it up to us to prove how we can help you.

MEN WANTED AS CERTIFICATED ELECTRICIANS

This is the Electrical Age, and this wonderful new profession is calling you. The demand for expert Electricians is greater every year and the salaries higher. Electricity is truly the greatest motive power in the world, to-day, and now is the time to enter this profession.

YOU CAN DO THIS

AFTER HOME STUDY

$36.00 TO $100.00 A WEEK

You can earn $36 to $100 a week and more as an Expert Electrician. If you have a common school education I can train you in a few months at home. Big lighting and power companies, municipalities, and manufacturers are always seeking trained men to handle their Electrical problems.

SPECIAL OFFER: Owing to the big demand for trained Electricians in the Government Service I am making a wonderful offer for those who enroll during October.

I Guarantee Satisfaction

Every student receives our Sealed Guarantee Bond, which guarantees to return every penny of his money if he is not entirely satisfied. No other school has made this wonderful offer, but I know the success I have brought to hundreds of my students, and I know what I can do for any ambitious young man who will give me a little of his spare time each day.

FREE ELECTRICAL OUTFIT

For the next 30 days I am giving each student an Outfit of Electrical Testing Instruments, Tools, Electrical materials, and Motor absolutely Free. My instruction is by practical methods and this outfit is used in working out the lessons. Practical training with the theory makes perfect. I am Chief Engineer of the Chicago Engineering Works, and I can give you the training that will land the big jobs and hold them.

This is the only Correspondence School in America that has fully equipped Electrical Shops where students may come for special instruction.

If you are in real earnest I want to send you my Book—"How to Become an Electrical Expert." It's free. No matter how many other schools you write to I want you to have my book—It's different because it's practical—Write today.

MAIL THIS COUPON

CHIEF ENGINEER L. L. Cooke Chicago Engineering Works

Bigger Pay for YOU

"See them first--pay afterwards"

Small Monthly Payments if you're satisfied

You Can Now Know ELECTRICITY As Experts Know It

When we observe the ever-increasing applications and usages of electricity, we wonder if all the present openings and the newly created positions in the electrical world can ever be filled.

The ending of the war lends a new and mighty impetus to the electrical end of American industries. Salaries are soaring. There is practically no limit to the earning power of the man who educates himself in the finer points of electrical work.

Actual working facts

With the advent of the new Library of Practical Electricity, by Terrell Croft, a new era is marked in the production of self educational electrical literature. This library satisfies a demand never heretofore met—the demand for a home study course which would bring out in detail the actual working facts. This great undertaking has been accomplished. It is a seven-year task completed.

No previous electrical training necessary

Three thousand pages, with twenty-one hundred of the learest illustrations ever put into book form. Each of the eight volumes is indexed so that everything you want to know about electricity is at the finger's end. And when you find what you want, there is not merely a short question and a short answer. You are told everything you want to know. The explanation is clear to you, regardless of whether you have had a previous knowledge of electricity or not.

8 Vols.

Flexible binding

Pocket size

3000 pages

2100 illustrations

Know electricity as the highest paid engineers know it

When you are studying the Croft Library of Practical Electricity, you are studying electricity as experts know it. You are acquainting yourself with the methods employed by the highest paid electrical workers and engineers in America.

This Library of eight volumes sent to you FREE for 10 days' trial

So positive are we that you will be pleased with the Croft Library of Practical Electricity that we offer to send the entire ten volumes for ten days' free use. All you need do in order to have the books sent, charges prepaid, is to fill out the attached coupon and return to us. Keep the books ten full days. Then if you are not satisfied, return them at our expense. On the other hand, if you find that they will help you, as they are helping thousands of others, send us the small sum of $2 per month for eight months.

A letter that means something to every man in America who is interested in electricity

McGraw-Hill Book Company, Inc.
239 West 39th Street, New York, N. Y.
Gentlemen: In an attempt to express myself about CROFT'S NEW LIBRARY OF PRACTICAL ELECTRICITY, I have never seen and do not believe there was ever printed in the English language, a more comprehensive set of books. It is a library that is just as valuable to the novice as to the expert, because it is all practice.
Respectfully,
GUY H. PEIFER.

The New Wireless

IT will come as a profound shock to all wireless enthusiasts, scientific and amateur alike, that their present-day notions on wireless are totally erroneous and not based upon actual facts. For years we clung to the theory that a wireless message radiates from the aerial wires of the sending station and speeds over the surface of the earth thru the ether towards the receiving station. We thought that we were sending out pure Hertzian waves from our transmitters. We thought that we received these waves over the aerial wires of our receiving station. All of these theories are wrong and will be relegated shortly into the past along with the early notion that the earth stood still, while sun, moon and stars revolved around it.

Remain only the physical facts that we did send and did receive messages without wires—but they are not sent by means of pure Hertz waves, nor do they go by way of the ether as radiations.

In a highly illuminating article printed elsewhere in this issue, Nikola Tesla explodes all of our present orthodox views as to wireless propagation and makes it clear that the earth is the sole medium thru which our wireless impulses travel, in the form of true conduction. Particularly does this hold true for long distance messages: Here we are sending out a compound impulse three quarters of which is a galvanic current, traveling thru the conducting earth, the other quarter or less is in the form of Hertz waves, going by way of the ether. This explains why we can send signals to airplanes and vice versa; but even here we probably have to do not with pure Hertz waves it is almost certain that we have capacity-inductive effects as well.

Tesla maintaining that there can be no long distance effects by radiations transmitted thru the ether, but rather only by currents thru the earth, it follows that in his opinion all our radio apparatus is designed and operated faultily. Indeed, this is not a brand new idea of the famous inventor. He has been preaching it ever since he took out his first patents and described his system in 1893—long before Marconi thought of wireless But he was preaching to a stone deaf scientific world.

But how simple it all becomes when we stop to apply a little reason and logic to Tesla's claims. For instance, we can send radio impulses three to five times as far over salt water as over land. Why? Simply because the impulses go *thru* the water, which is a much better conductor than earth alone. If we were sending pure Hertzian waves, why do we connect one wire at both sending and receiving station to the ground? Hertz never dreamt of such a thing. If you are still unconvinced that the earth is the chief medium of transmission, disconnect your ground wires entirely and try to send and receive. Now you may work with Hertz waves, but the distances you can bridge will be pitifully small.

Already Tesla's logic is filtering into our radio scientists' minds. *All the big stations are beginning to scrap their towers and aerial wires, at least for receiving. They now bury their "aerial" wires in the ground,* and lo! they can receive signals twice as far as before. Incredible, but it is being done every day. And—wonders upon wonders—how we will laugh at our present and past blindness—*the static interference is practically gone* the minute we pull our aerial wires down and bury them! Static Electricity? There never was a reason for having the bugaboo, for there is no "static" in the ground.

But Tesla goes much farther. In time he will show the world wireless power transmission effected *not by ether waves but by currents thru the earth,* which is a first rate conductor. Like all big things, the problem is simple. At some point on the globe he will erect a station powerful enough to charge the whole earth with electricity—and keep it charged. To do this we need about 10,000 kilowatts. Then at *any* point on the globe the current can be tapt by means of suitable apparatus. Like a bell ringing transformer, *connected* to your supply line, no current is consumed unless you close the secondary circuit. Tesla's world wireless works just that way. *No current is consumed till it is tapt at the distant receiving station.*

H. GERNSBACK.

The ELECTRICAL EXPERIMENTER is publisht on the 15th of each month at 233 Fulton Street, New York. There are 12 numbers per year. Subscription price is $2.00 a year in U. S. and possessions, Canada and foreign countries, $2.50 a year. U. S. coin as well as U. S. stamps accepted (no foreign coins or stamps). Single copies, 20 cents each. A sample copy will be sent gratis on request. Checks and money orders should be drawn to order of EXPERIMENTER PUBLISHING CO., INC. If you change your address notify us promptly, in order that copies are not miscarried or lost. A green wrapper indicates expiration. No copies sent after expiration.

All communications and contributions to this journal should be address to: Editor, ELECTRICAL EXPERIMENTER, 233 Fulton Street, New York. Unaccepted contributions cannot be returned unless full postage has been included. ALL accepted contributions are paid for on publication. A special rate is paid for novel experiments; good photographs accompanying them are highly desirable.

El Paso, Texas, Oct. 1, 1917.

MR. CHARLES F. HAANEL, St. Louis, Mo.
In Re "The Master Key"

My Dear Mr. Haanel: The value of an idea is determined by its application. Pragmatism has long since spread beyond the confines of Missouri. The world insists on being shown.

The lash of circumstances and the logic of events are, more than ever, impelling men to think. Whether an idea be a new process for picking cabbages, or an old process (Kaiserism, for instance) for preserving kings, we are from Missouri.

A philosophy of life having as its base blind optimism; a religion that won't work seven days a week, or a proposition that isn't practical, appeals to the intelligent not at all. It is results that we want and the acid test is: will it work?

The Master Key qualifies. It is the most lucidly scientific statement of "Truth" that I have seen. It reconciles rationalism and religion; illumines economic determinism and the materialistic conception of history, and is an infallible guide to understanding. It contains in condensed form the substance of an entire library on science. Its teaching, if consistently applied, will make a man healthy, wealthy and wise. Its distribution is super-missionary work in excelsis. Those who wish to think intelligently will find it invaluable.

Intelligence rules. Desire, intelligently directed, is a creative force which automatically causes its object to manifest on a material plane. It is the law. Let him that hath an ear to hear, hear.

Yours truly,
CHAS. A. HEARD.

May 15, 1918.

Dear Mr. Haanel: Ever since I have been old enough to read, I have been reading occult and metaphysical literature. I have waded ears deep through the books from all ages, all lands, all schools.

I have rejected tons of lies, oceans of misconceptions, an entire universe of false deductions.

I have found grains of truth in mines of folly, and worlds of truth in a single grain. The pursuit was interesting in itself, and I do not regret the time spent upon it. But it was a genuine surprise to read your Master Key System and find within, the essence of all that I had read, with much more added thereto.

In this extraordinary system you have sifted the true from the false; you have given in concrete form all that is worth while in many schools of philosophy.

You have placed arcane truths into the hands of the uninitiated as weapons they can learn to use without danger to themselves. I congratulate you. You are doing mankind a service.

Yours very sincerely,
CHARLES F. OURSLER.
501 Fifth Avenue, New York City, N. Y.

THE LOWE OBSERVATORY
Edgar Lucien Larkin, Director
Los Angeles, Cal., Dec. 6, 1916.

MR. CHAS. F. HAANEL, St. Louis, Mo.

Dear Sir: Your booklet, Master Key, ought to be expanded into a book. Its teachings that Mind is the all-dominating creative force is precisely in line with the wonders of the most recent psychology. All persons having desks should have this pamphlet thereon. And it would be a fitting pocket companion.

EDGAR LUCIEN LARKIN.

Detroit, Mich, May 28, 1917.

Dear Sir: The words, "Your world will change as if by magic, the moment you realize the marvelous power within your control," page 6, I have underlined. They state a fact, a real live fact; and to me this is the most wonderful, the most important fact of all—that one may put this knowledge to an immediate test, that one may, after learning of this power, proceed to apply it with a definite knowledge as to results.

W. M. HOWE.

which can throw wide the doors which seem to bar men from the Treasure House of Nature. This may seem "too good to be true," but remember that within a few years science has placed almost infinite resources at the disposal of man, is it not possible that there are other laws containing still greater possibilities? Get the Master Key and find out for yourself how the invisible forces of Faith and Desire are converted into actual, tangible, concrete facts in the objective world.

Chattanooga, Tenn., Feb. 22, 1918.

The Master Key is wonderful, it has brought about a most remarkable change in my environment, attitude toward life, mental and physical condition. I am an entirely new person and improving daily, discouragement, lack of ambition, physical ills, mental distress, and fear are things of the past.

I cannot find words that express my gratitude for all that the Master Key has done for me. With heartfelt thanks to you, I am,

Yours sincerely,
R. J. ARNOLD.

---

160 Claremont Avenue, New York
New York, Nov. 18, 1916.

I have made a thorough examination of the little booklet which you so appreciatively have called the Master Key, and can unhesitatingly endorse it and its teachings.

In this pamphlet of only a few pages you have led a hungry world to the threshold and placed in their hands a "key" with which the understanding ones may unlock the door and enter "The Secret Places of the Most High," and enjoy the abundance of all good to be found therein. With best wishes,

AGNES MAE GLASGOW.

HOME LIFE INSURANCE CO. OF N. Y.
James Lee Bost, General Agent
Washington, D. C., Dec. 29, 1916.

Dear Sir: Your little booklet, entitled "The Master Key," has been received and I had great pleasure in studying it carefully. It is a very clear and concise, yet forceful presentation of the big subject handled, and shows a very wide study of the absolute teachings and deep understandings of the same.

Very truly yours,
JAMES LEE BOST.

"I am able to extract from this system all that can be made known by the finite mind relative to origin, evolution, destiny and the much-mooted riddle of the Universe."

"I can hardly grasp the full significance of the facts. The vastness of this subject is so overwhelming it seems a life-time of effort could never fathom all its possibilities."

"You have given a wonderful analysis of the power that is the creative force by which the master mind controls his destiny."

"The Master Key is too modest a title for such a stupendous revelation."

"I have found the Key and with it each day am opening the store-house of wisdom and success, of which for many years I was utterly ignorant."

FREE! There is no charge for the MASTER KEY. It is FREE!

Master Electricity By Actual Practice

The only way you can become an expert is by doing the very work under competent instructors, which you will be called upon to do later on. In other words, *learn by doing.* That is the method of the New York Electrical School.

Five minutes of actual practice properly directed is worth more to a man than years and years of book study. Indeed, Actual Practice is the only training of value, and graduates of New York Electrical School have proved themselves to be the only men that are fully qualified to satisfy EVERY demand of the Electrical Profession.

The Oldest and Only Institution of the Kind in America

At this "Learn by Doing" School a man acquires the art of Electrical Drafting; the best business method and experience in Electrical Contracting, together with the skill to install, operate and maintain all systems for producing, transmitting and using electricity. A school for Old and Young. Individual instruction.

Over 5,000 Graduates are Successful Men in the Electrical World

No previous knowledge of electricity, mechanics or mathematics is necessary to take this electrical course. You can begin the course now and by steady application prepare yourself in a short time. You will be taught by practical electrical experts with actual apparatus, under actual conditions.

Let us explain this course to you in person. If you can't call, send now for 64-page book—it's FREE to you

New York Electrical School
29 W. 17th St., New York, N. Y.

Please send FREE and without obligation to me your 64-page book.

Tidal Power Problem Solved at Last

TIDAL power is one of those long dreamed of possibilities in engineering which has occupied the minds of great philosophers for generations. Why not,—for who can stand down by the ocean shore, or even by any large river having an appreciable tidal rise and fall, and fail to be imprest with the gigantic natural power here spread out before us, and let go to waste for all these years. Think of it—tens of thousands, yes, millions, of horse-power dissipating itself on our coastal and river shores every day in the year. To realize this fact fully we need but reflect for a moment. If the tide brings us a rise of several acres (many thousand cubic feet) of water, why let it fall again, *uselessly?* Allow the water to flow, without friction, into huge basins at high tide; trap it, and when the tide falls, permit the imprisoned water to escape, *but thru turbines*, back to the tidal level.

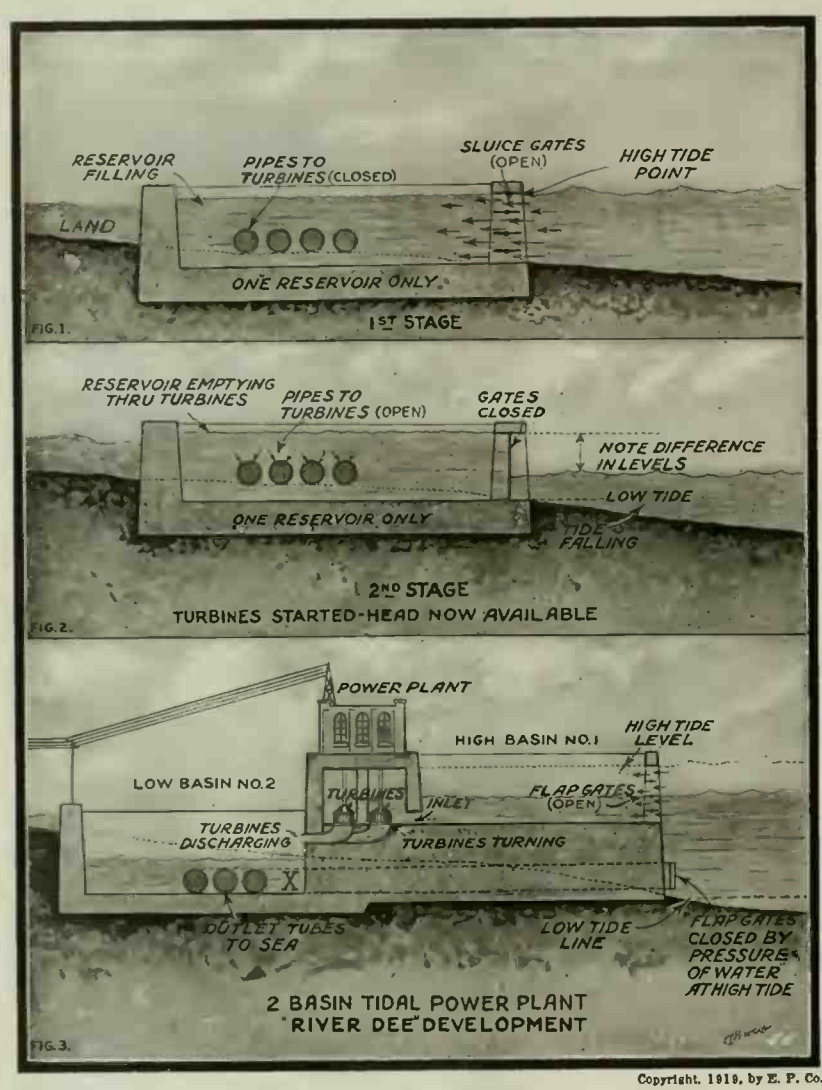
That is the idea several engineers have had, but an English engineer seems to have solved the problem successfully with his specially designed tidal turbines and triple basins. His name is J. O. Boving, and his scheme is so practical that it has been proposed for the development of electric power from the tide water at the mouth of the River Dee. Mr. Boving's description of the tidal power plant is as follows:

Altho the (English) Government a few months ago took a very wise and necessary step in appointing a committee to inquire into the possibilities of water power development in the British Isles, there is one aspect of the question which does not seem to have attracted adequate attention, and that is the utilization of *tidal power*. The rise and fall of the tides around the English coasts vary greatly, from a maximum of nearly *fifty feet* in some places on the west coast to only a few feet at others. Generally speaking, the differences on the east coast are small, but on the west coast there are many river estuaries and other inlets which offer abundant possibilities for obtaining power from the tides.

Some years ago I had an opportunity of examining the possibilities of developing a tidal water power on the estuary of the River Dee, where the tidal differences are roughly *thirty-five feet* at *highest* Spring tide and *thirteen feet* at *lowest* neap tide. The scheme put forward was to form a railway embankment across the mouth of the estuary so as to connect up the Welsh railway system with Birkenhead and Liverpool. The area of the impounded water behind this dam was to be *forty-four square miles*. On account of local conditions it was not difficult to divide this basin into two equal parts, and to arrange these two inner basins, the sea forming the third, in

Copyright, 1919, by E. P. Co.

The Proposed River Dee Tidal Power Development As Designed By a Famous English Engineer—J. O. Boving. This View Shows His Two Basin Proposal Where the Area of the Impounded Water Would Amount To Forty-Four Square Miles. The Maximum Tidal Difference Is In This Case About Thirty-Five Feet. A Large Railway Embankment Is a Part of the Scheme, This Railway to Connect Up the Welsh Railway System With Birkenhead and Liverpool.



www.americanradiohistory.com

such a way that a power station could be worked *continuously* under constant head and with constant output. The plan was roughly as follows:

Supposing that we start with high tide, the flap gates leading from the sea to the high basin would be open, and the water would flow in and pass thru turbines into the lower basin, the automatic flap gates to this basin being closed by the water pressure outside. This flow would continue until the level in the sea equaled that in the high basin, when the flap valves to this would slowly close. *In the meantime the level in the high basin would slowly SINK as water was consumed, and the level in the low basin would INCREASE until the moment when the water level in the sea had fallen to such a point that the gates of the lower basin would open and discharge the water in it completely.* On the rising tide a similar sequence would be followed, and a continuous development of power would thus be maintained.

There are a great number of cases along the coast where it would be easy to create a reservoir at a considerable height adjacent to the tidal power station, or at least within a distance which would make electric transmission easy. In such cases the surplus power might be used during the periods when it is available for pumping up water to such reservoirs, while during the intervals, when power is required, it could be obtained thru high-pressure turbines driven by the stored-up water supplied.

It will perhaps be argued that this is a very elaborate and costly arrangement which would not pay. The problem in fact resolves itself to this: Assuming (1) that an ordinary water power in a river was developed and used for commercial purposes during twelve hours out of the twenty-four and that it was a good commercial scheme under these conditions; and (2) that a high pressure power development could be obtained by using stored water for twelve hours of the twenty-four, and that this also was a commercially good undertaking in itself; then it must be equally sound commercially to link the two together and produce power around the twenty-four hours. In the tidal scheme the only things added to the arrangement described above are pumps, which are a negligible factor in the general costs (they would correspond to something like $3.75 per h. p.). The pipes thru which the water is pumped up are, of course, the same as those which return the water from the high pressure plant. Everything else is in common.

Copyright, 1919, by E. P. Co.

Progressive Illustration Showing How the Tidal Power Plant Works. First Figure Shows How the Rising Tide Fills the Large Basin Or Reservoir With Water. At Full Tide the Sea Gates Are Closed and After the Tide Has Fallen a Few Feet, a Working "Head" Becomes Available As Fig. 2 Shows. The Impounded Water Discharges Thru Turbines Back to the Sea. Fig. 3 Shows a "Two Basin" Plant Which Discharges the Impounded Water In Two Stages, Giving Steadier Power Development.

The calculation for such a scheme is simple, and in the case referred to, assuming that in any case a bank was needed across the Dee mouth, for railway purposes, there is no doubt that this power development would pay well. In cases where two tidal plants of similar size are close together the necessary conditions could be realized by connecting them. There would be nothing novel in such plans; the turbines would be of standard design, the variation in the head would be only such as would be allowable for in ordinary turbine plants, and there would be no need to bridge over any periods when the power developed fell much below the average power.

However, in most cases it would be impossible to develop the three-basin idea, and it would be necessary to rely only on one inner reservoir and the sea. Obviously under such conditions the engineer has to contend with very great variations in head and power. The great differences that occur in the tidal ranges at various times compel him to calculate his turbines for the average head derived from neap tides.

The general idea of a one-reservoir tidal scheme is as follows: At the beginning of high tide the sluices are open fully and the water rushes into the inner reservoir, filling it up as quickly as possible. Then the gates are shut for a certain time, *until the water level outside has fallen to give a desired difference in level between the reservoir and the sea.* (See detailed illustration of one reservoir scheme herewith.) The turbines are now started and kept in operation under virtually constant head, while the level in the reservoir falls at the same time as the tide. Some time before the lowest level of the tide the turbines are shut off, the gates opened, and the remaining water in the reservoir allowed to rush out with the lowest tide. Then the gates are closed, the tide rises outside until the difference in level between the sea and the reservoir has again reached the agreed amount, the turbines are started, and the same procedure is gone thru for the rising tide as just described for the falling. Thus for certain definite periods power is obtained at a nearly constant rate, but in the intervals no power is produced.

Up until now we have been satisfied to mine and burn coal, prospect for oil gushers, and, in fact, have tried out about every expensive source of power we could think of. This comes of prosperity. America is rich, and the keynote of the hour is "speed." Design, develop, build,—do all these things—say our great philosophers and educators, but do them FAST. Speed is a fine thing—in its place; but there is bound to be a big bill to pay, some day. Why not live and work efficiently; not necessarily in a slow, plodding, unenlightened way, but in an economical manner. Coal and oil will not last forever. If you have ever visited Holland, you have undoubtedly been imprest with the simplicity of things, and those windmills. There is a fine bit of antique engineering. The Hollander is using an untaxable, free, and powerful source of natural power—the wind. Besides these you will find in all parts of Europe the ever-present water wheel and turbine. Excellent, steady power, untaxed in most cases; but do the American farmers and developers put the *free* wind and water power to work? Yes, they do NOT. They would rather spend a thousand dollars or so for a gasoline engine and then work their heads off for the rest of their lives buying gasoline and oil to run it with. You can see hundreds of windmills and waterwheels rusting to pieces all over the country. A great pity and a prodigious waste.

Sweden, which is rich in water power, sends electricity across the sound to Denmark.

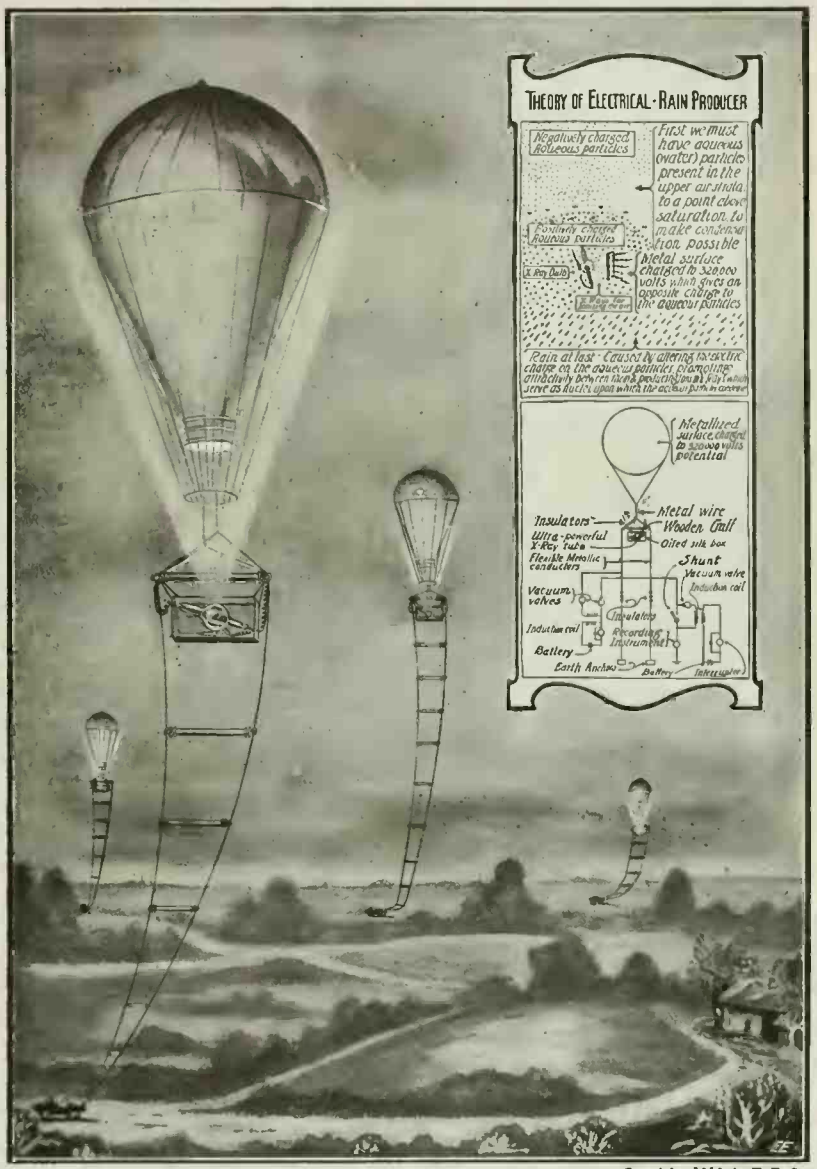
www.americanradiohistory.com

Producing Rain by Electricity and X-Rays

FROM time to time in the world's history, there have been schemes promulgated for and attempts made at producing rain by artificial means under the control of man. One of the most promising of the recent schemes for producing rain-fall at any desired time, providing there happened to be aqueous particles contained in the atmosphere, is that due to an Australian scientist, John Graeme Balsillie. He has taken out patents on his system of producing rain-fall electrically, and one of his latest American patents is here pictured and described.

The illustration shows how Mr. Balsillie proposes to send up a series of balloons or large box kites of sufficient size to carry an extra large X-ray tube, and also capable of supporting two thin electric wires of considerable length. As the inventor states in his patent, his invention "consists in electrical means for assisting and promoting under suitable meteorological conditions the formation of aqueous particles in the atmosphere and assisting in promoting the deposition of water particles (rain-fall) from the atmosphere, and further to provide suitable apparatus for producing the necessary electrical conditions for that purpose." This balloon may be controlled from a motor truck which can speed over the country to various points wherever it may be desired, and a portable gasoline engine and dynamo outfit on the truck may supply the necessary current for operating the powerful X-ray tube carried by the balloon, as shown in the illustration, and also for developing the high potential current, about 350,000 volts, which is employed for *charging the metallized surface of the balloon.*

As has been pointed out in previous articles on similar inventions in this Journal, —and as substantiated by the opinion of several well-known scientists, included Dr. Henryt Arctowsky, the Arctic explorer, of New York,—the inventor informs us in his patent that his discovery is susceptible to practical use *only* when the cooling of aqueous vapor resulting from its expansion in elevated regions of the atmosphere and other natural influences brings the vapor *above the saturation point,* so that *condensation* becomes possible.



It has been ascertained that ions, produced in this case by Mr. Balsillie by the powerful X-rays, which ionize the atmosphere in the vicinity of the balloon, may act as nuclei, upon which, under certain conditions, water vapor will condense. Aqueous particles comprising cloud, fog or mist are invariably electrified by natural causes, and altho their electrification is of one sign, the potential or voltage distribution thruout the mass is uneven. Aqueous particles of approximately equal dimensions and potential will therefore naturally repel each other, and no condensation will result. However, nuclei, upon which water condensation may take place, can be created by ionizing the atmosphere, such as by powerful X-rays, and further if under normal conditions, a *mutual repulsivity* of charge of the aqueous particles is altered to a condition of *mutual attractivity,* then coalescence of such aqueous particles will be assisted, and rain caused to fall.

As the accompanying detail illustration shows, if a metal plate (or the metallized surface of the balloon) is charged at a very high potential of say several hundred thousand volts, then this electrified body serves to give an opposite charge to the aqueous particles floating in the atmosphere.

The aqueous particles thus become possest of a charge of *opposite sign* to that which they originally had. This charge of opposite sign, however, is not and cannot be communicated instantaneously to all the particles in said zone. The particles in close proximity to the source of electrification are rapidly charged by electrostatic induction with a charge of opposite sign to that which they originally possest. This inversion of sign of charge is gradually communicated to all the particles in said zone in an ever-expanding circle, about the source of electrification as a center. At the perimeter of the circle of imprest electrification, at any instant, a condition exists whereby particles in close proximity to each other are possest of electrical charges of opposite sign. Such particles consequently attract each other, coalesce, and then fall as rain, under the influence of gravity.

The apparatus used for producing the high potential uni-directional current for charging the metallized balloon surface is produced by a transformer and interrupter supplied from a dynamo or other source on the ground. The secondary circuit of the induction coil is equipt with rectifying valves in order to rectify the current. Similar appratus, also provided with vacuum

Moving Platform for New York's Cross-Town Subway

By H. WINFIELD SECOR

SUBWAY commuters and others who use New York's great underground transportation systems daily, have been much provoked and harast in the past several months by the various difficulties occasioned by the change in the two principal North and South arteries of subway travel. In other words, the subway system was changed over a few months ago from the old familiar "Z" system to the new so-called "H" system, which gives a continuous east-side and west-side subway express route, the—bar of the "H" connecting at the present time by shuttle trains running under 42nd Street between the Grand Central Station and the Times Square Station. The Grand Central Station is located at Park Avenue and East 42nd Street, while the Times Square Station is located on the west side at the juncture of 7th Avenue, Broadway and 42nd Street.

For several reasons the shuttle train service seems apparently not to be the best solution of the problem confronting the subway engineers in smoothly and quickly transferring the cross current of traffic between these two stations, and therefore Public Service Commissioner Travis H. Whitney has proposed that a *continuous moving platform* such as here illustrated be installed in the space now occupied by two of the four shuttle tracks. Mr. Whitney's original idea called for the installation of this continuous moving platform on the two northerly tracks of the shuttle system, leaving the two southerly tracks for train service, which might be necessitated whenever the moving platform might for instance get out of order, when the shuttle train service could be put in use. Also these two tracks could be used for the extension of the Queensboro Subway system, which is another proposal in the minds of the Public Service Commission engineers, so that eventually the Queensboro trains which now end their westward run at the Grand Central Subway Station, two levels underground as here illustrated, will terminate at Times Square.

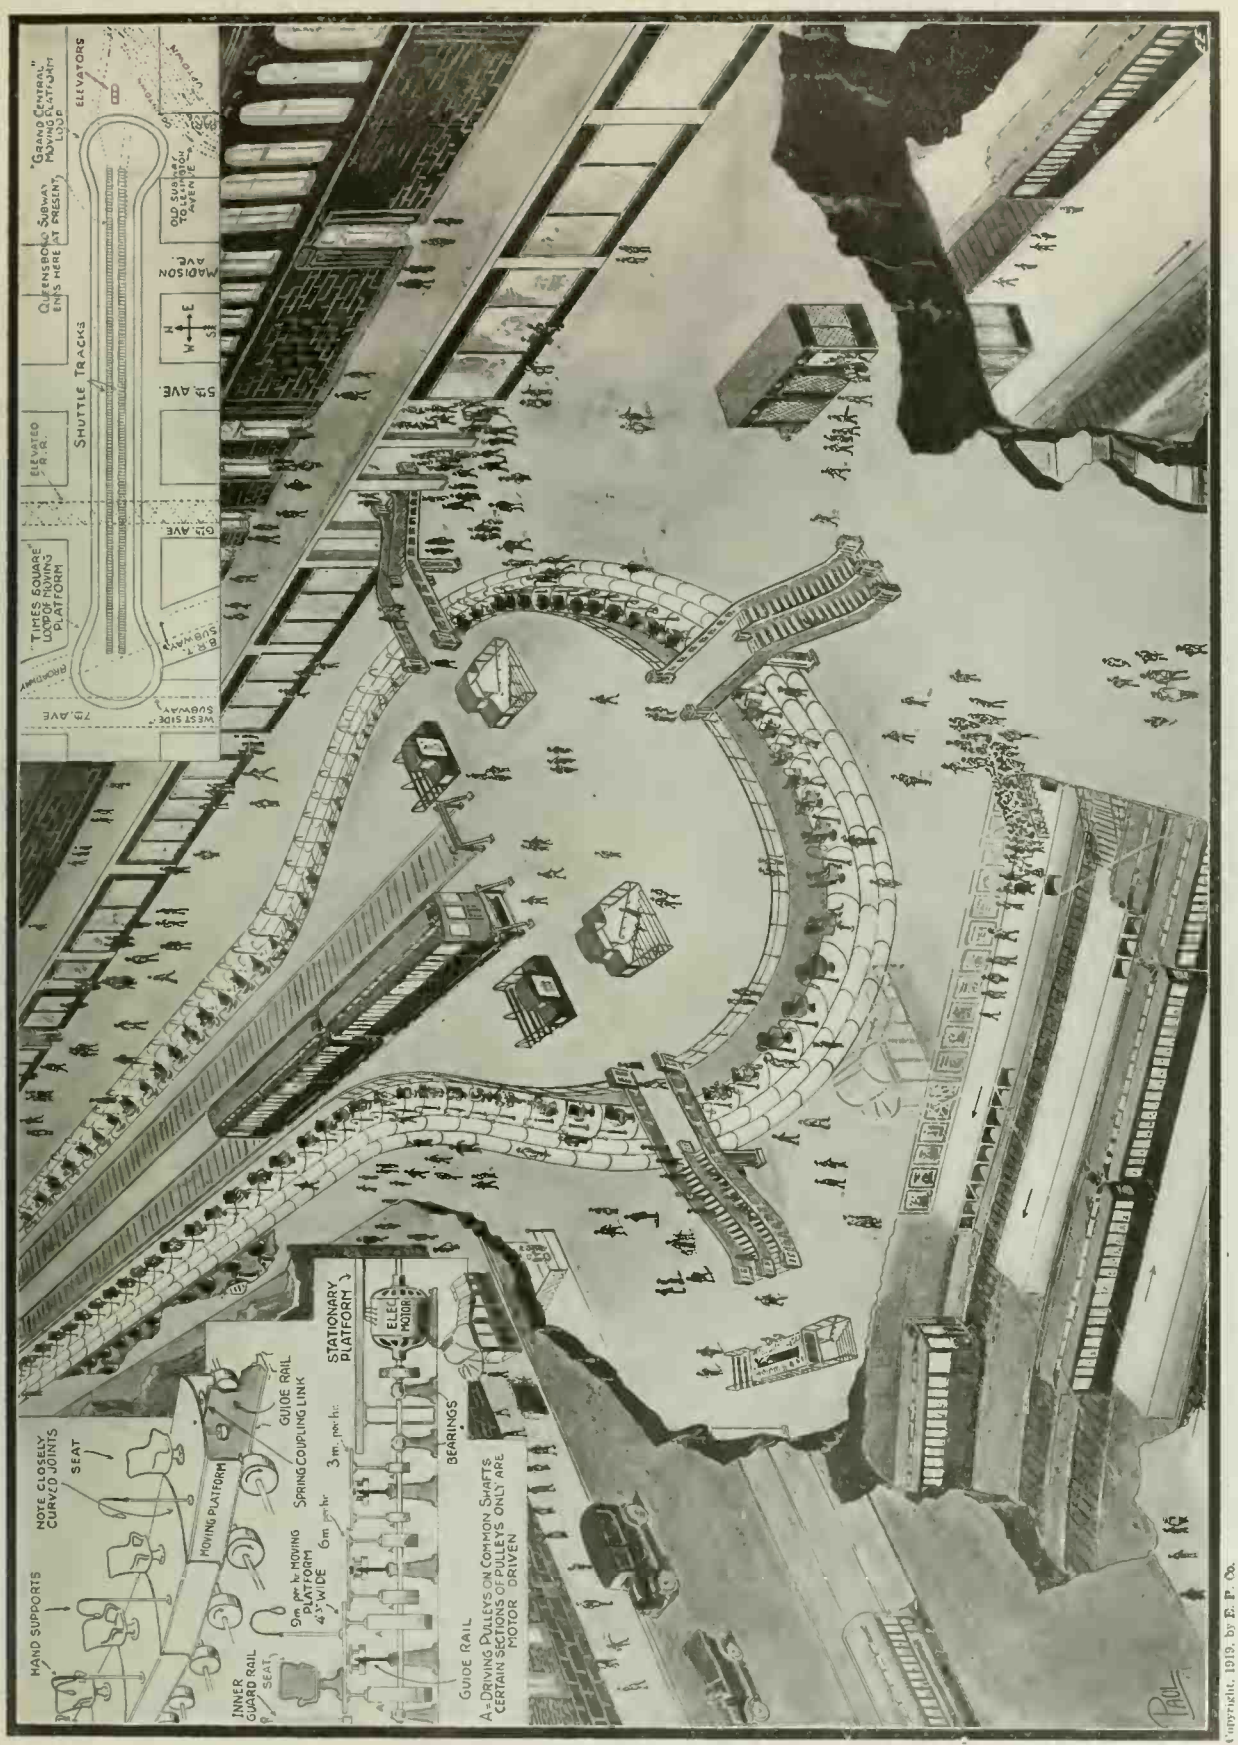
In a recent interview with Mr. M. Everhart Smith, consulting engineer of the construction concern which will build this gigantic moving platform, six thousand feet in length and capable of carrying ten thousand people at one time, a different suggestion was made concerning the location of this proposed continuous moving platform. Instead of having it occupy the space over which the two northerly tracks now run, Mr. Smith pointed out that it is much more feasible and practical in every way to have it occupy the present position of the extreme northerly and southerly tracks, leaving two tracks in the center for emergency shuttle train service or for the extension of the Queensboro system to Times Square. This modification of the design and layout of the moving platform system is a very important one and practically necessitated, for the reason that if the return loop of the platform past along in the position now occupied by one of the inside tracks, then passengers could not alight at any point desired, excepting at the terminal stations at either Grand Central or Times Square.

As is pointed out there should be not less than three moving platforms in any case, each moving at a different speed, the outer one say at three miles, the intermediate at six miles, and the inner platfrom carrying the seats, at nine miles per hour. Therefore, as Mr. Smith suggested, in discussing Mr. Whitney's original idea, it would not be possible for passengers traveling *east* to attempt to cross a high speed (9-mile per hour) platform moving *west*. To give the greatest service, and to enable passengers to alight from or board the moving platform at any point along the entire route, the moving platform system should occupy the space now used by the two center or the two outside tracks. In other words the two moving platforms would have to have adjacent to them a stationary platform provided with suitable exits and entrances.

If the present shuttle train service should be extended to connect with other subways on avenues farther west than 7th Avenue at Times Square, the trains, Mr. Smith explained, would not conflict with the moving platforms, because the latter would operate only between two of the train stations. In this case the moving platform would be used merely for the collection and distribution of passengers within the area of Times Square and east and west of it.

Concerning the initial cost of this great moving platform it is estimated that it would approximate $1,000,000.00, and that it would take six months to build and install. At the present time the engineers of the Public Service Commission and the subway staff, as well as the experts of the moving platform concern, are busy trying to find a satisfactory space for the platform return loops at the station ends at Times Square and Grand Central; these loops being quite an extensive affair, the minimum diameter of the loop being about 130 feet.

The moving platform idea is not so entirely new or untried, as it might appear at first. They have been built and used at different times quite a number of years ago, both abroad and in the United States. The same concern which is now designing the one for installation under 42nd Street, had one in successful operation at the World's Fair in Chicago, 4,400 feet in length. Visitors to that Fair will undoubtedly remember the great attraction, the platform of which was operated by electric motors to the total of 150 horsepower, which had a carrying capacity of 6,000 passengers. On "Chicago Day," 185,000 passengers—twice the daily traffic of the Brooklyn Bridge—were carried without any inconvenience. The total live and dead weight was 900 tons. As aforementioned, the new platform proposal for 42nd Street, New York City, is approximately 6,000 feet in length, with a capacity of 10,000 passengers, and will require electric motors distributed along its length to a total of about 250 horsepower.



Undoubtedly some of our readers will be interested in some of the more or less obvious technical details and just how the various parts are to operate. Thru the courtesy of Mr. M. Everhart Smith, we are pleased to give several details here, which have seemed of paramount interest to the editors. First, the three moving platforms, moving at three gradually increasing velocities in order to allow a person to board it without being thrown over or requiring acrobatics, will not be exactly on the same level, but each platform will slightly overlap the next succeeding platform, this practise having been found the best from past experience. The detailed drawings in the accompanying illustrations show clearly how the platform is made in a large number of jointed sections, each of which is provided with a flexible coupling so as to easily negotiate the curves at the station loops. Under the whole moving platform there is installed a stationary series of wheels or pulleys mounted on axles. The depending rails of the various platforms rest on the respective pulleys or wheels belonging to that particular platform in each case, as the drawing indicates. At about every eighth or tenth pulley there will be located a small electric motor connected by driving chains to several of the pulley shafts. All together about 250 horsepower in electric motors will be required, which is quite small indeed compared to the two thousand horse-power in electric motors necessary for the operation of a ten-car subway train.

The matter of seats on the third or high-speed platform is a very flexible one, and at first most probably but one row of seats will be installed, as the illustration shows, but more seats can readily be added at any time. It will only require a few minutes to go from Grand Central to the Times Square Station or vice versa on the moving platform, and the seats would probably only be used by women, as Mr. Smith pointed out. Another feature at this point is that those in a hurry can walk along any one of the moving platforms and gain time; for instance, if a man walks at the rate of four miles per hour on the nine mile per hour platform, he will actually be moving in that particular direction at the rate of thirteen miles per hour. In addition to the advantages of constantly moving platforms with no waits for shuttle trains, and with entrances and exits at every cross-street, such as at Madison, Fifth and Sixth Avenues, an immense income could be derived from the stores and large advertising spaces along the platforms.

Referring once more to the platform and its operation, it will be seen how the motor-driven wheels under the rails of the platform sections will cause these sections to be propelled forward in a direction depending upon the rotation of the wheels. The endwise juncture between the sections and the moving platforms is on an even level, and they are closely curved on the order of a knuckle-joint so that no gap occurs between them. The rails of each section are so designed as to correspond both at front and back, and thus this unique design permits of the section moving around the loop curves in a smooth manner. Light steel posts, containing straps for the use of the "strap hangers' brigade," without which metropolitan life would lose a large part of its vim and pep, will be provided, as the illustration shows. Of course the chaps on the way home from the club will have to "mind their step," as the English say, or—well—WELL, by that time the Nation will be dry anyway, so we should worry!! And besides the late home-comers using the platform during the "G. M. hours" will most probably be lucky enough to find it pretty well deserted in the event that they may have drunk one too many glasses of near-beer or cherry flip.

Regarding the heating of this long tunnel, Mr. Smith has suggested that during severe cold weather the tunnel system, in which the moving platform was installed, could be steam-heated at regular intervals, and also special ventilating fans and baffle walls could easily be provided at the various stations, as well as at the terminals, so as to ensure the proper ventilation and heating of the passageway.

New York City Will Soon Have Something New To Interest Out-of-Town Visitors If This Recently Proposed Moving Platform Is Installed Under Forty-second Street to Connect the "Grand Central" and "Times Square" Subway Stations. There Are Three Moving Platforms, the One Carrying the Seats Traveling at 9 Miles Per Hour, and the Outer Two At 3 and 6 Miles Per Hour, Respectively. The Platform Required Would Measure 6,000 Feet or About 1¼ Miles, Have a Carrying Capacity of 10,000 Passengers, and Be Propelled By a Total of 250 Horsepower In Electric Motors. The Shuttle Trains May Be Retained for Emergency Use.

The Unknown Purple

By DOROTHY KANT

WHAT would you do if you had the power to make yourself invisible—not by means of Aladdin's wonderful lamp, but by an actual scientific invention? Ask Dad, he knows! Thus, for instance, it certainly would be a boon to some delicately balanced husband, homeward bound, to escape the shark eye of his better half, not to mention the rolling pin; to some suspicious wife, etc., etc., *ad infinitum*. Then think what a shock it would be to a Hun general, after the blimp observers had spied an advancing American Army, with the guns ready to be set off, when whisto! the American army wasn't there at all! In other words Grimms' Fairy Tales in real life.

That other minds have peeped into the bright future of this wonderful invisible "source," which would make radium cheap by comparison, is well exemplified in the fact that not so long ago in the March and April, 1918, numbers of the ELECTRICAL EXPERIMENTER, in a story entitled "At War With the Invisible" the underlying idea of up-to-date scientific invisibility was shown. Here we had a young and handsome lady of the year 2011 who possest a bracelet of bells encircling her wrist, which bracelet was concealed to the human eye, or rather invisible to it, due to an optical invention of a certain scientist. . . .

The author of the "Unknown Purple" evidently thought along the same lines, for here we have a plot with almost the same underlying principle, wherein a certain scientist discovers and perfects a substance by which he can make himself invisible merely by holding that substance in his hand. But let us delve a little deeper into a play that seems to have so big a success with New York's critical audiences.

The scientist in this play who is incidentally our hero uses his invention to wreak vengeance upon his unfaithful wife and her paramour by making himself invisible and by playing pranks with the fortunes of both wife and lover.

But how does he do it and at the same time raise the tension of the audience to such a height that you can hear a "dew" drop?

One of our ingenious readers not so long ago wrote, jocularly, suggesting that we run a perfectly blank cover on the magazine under the caption *"Camouflaged Ship on the Ocean"*. The joke was supposed to be that the ship was so well camouflaged that you could not see it at all—hence the blank cover page! The authors of the "Unknown Purple" evidently used a similar line of reasoning on which they built up their play.

The problem was how to show a man walking across the stage who is supposed to be invisible. The answer is simplicity itself: don't show him at all, but make the audience believe that he is really there. This is certainly simplicity reduced *ad absurdum*. But in order to show that the man was really there,—altho, of course he wasn't,—something had to be done, else the audience would not be sufficiently imprest and would take the hero's "absent treatment" as a joke. So the authors simply have a purple spot light arranged overhead, which light travels at a slow gait across the stage, and the lighting effects are so cleverly arranged that the audience obtains the impression that the invisible man is really concealed within the purple shaft of light.

For some reason or other the authors seem to think that to make oneself invisible, such action should be electric and accompanied by a purple light, in order to heighten the tension and to give the mysterious touch that is particularly impressive on a lay audience. So, in addition, whenever the purple light appeared, and when our invisible hero was on the stage, the effect was still further heightened by a certain low buzz produced by a spark coil vibrator or the like and which buzz was supposed to emanate from the substance in the hero's hand which created the invisibility. Needless to say it had the desired effect and many a young damsel felt purple gooseskin take the place of her natural one, and becoming the recipient of creeps and thrills such as never were hers before.

Three Exciting Scenes from "The Unknown Purple." Left, the Invisible Hero Goading the Husband to Kill His Wife by Whispering into His Ear. Center, the Invisible Hero Once More in the Act of Foiling the Detectives. Right, Working on the Villain's Imagination by Talking to Him, the Hero of Course Being Invisible.

Of course, the usual stage tricks were resorted to, as for instance when our noble hero stealthily and invisibly opens the safe to abstract certain important papers. We thus see the purple spot or ray centered on the safe, amidst the mysterious buzzing sound—then the click of the combination as it is turned—the opening of the safe door slowly and mysteriously. Yes, you guest it, the safe was opened by invisible threads or strings, as no hands or anyone were visible. A similar trick was used whenever the hero entered the stage by means of the door. The door, of course, opened without any visible mechanical means and the solution in this case too obviously was strings or threads. There was only one scene that was staged elaborately and that was in the

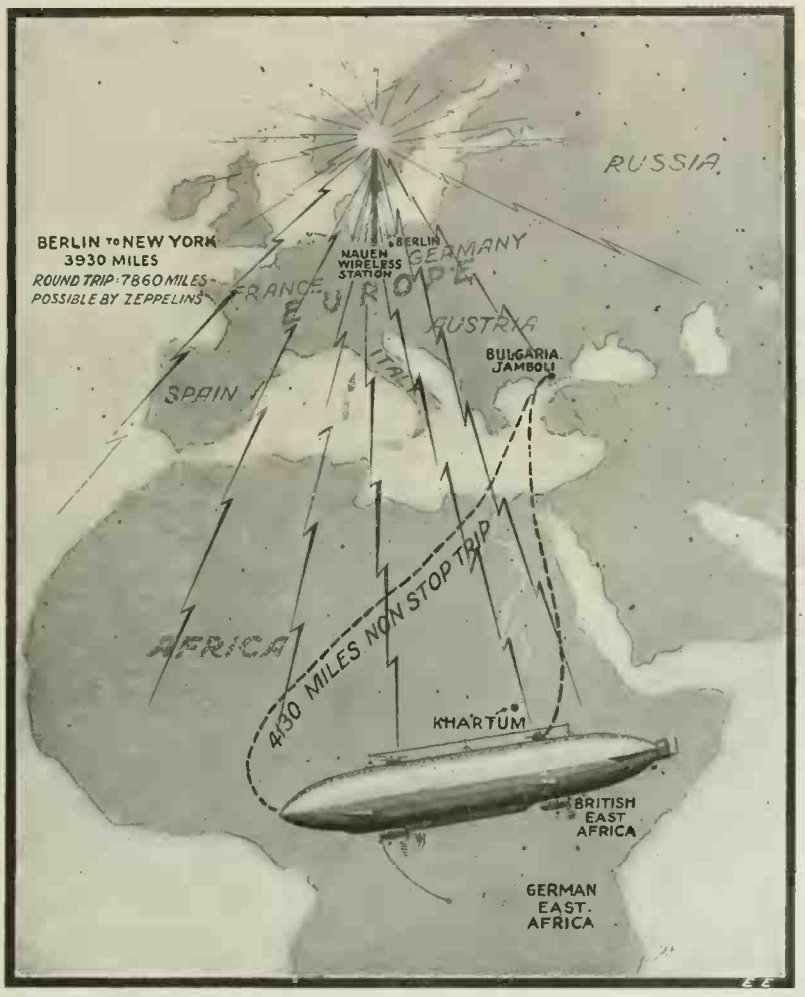
Zeppelin Flew 4,130 Miles Round Trip from Bulgaria to Khartoum

A RECENT wireless dispatch from a Berlin correspondent contains some most interesting news concerning Teutonic developments in giant aircraft. It is said that the Germans are busy constructing a mammoth airplane intended to cross the Atlantic Ocean. This huge aërial craft, now under construction, is stated to have a wing spread of 198 feet, and it is to be engined by 3,000 horse-power in petrol motors.

The Teuton aërial flight experts are said to be busy constructing a gigantic Zeppelin craft at Friedrichshafen, which is to be propelled by nine engines and eight propellers. It will have a carrying capacity of one hundred passengers, and it is hoped that the international situation will clear up so that the first trans-oceanic flight may take place this coming July. The voyage across the Atlantic from a point in Germany to New York City is expected to take about forty hours.

But coming down to cold facts and past performances, the accompanying illustration shows one of the most remarkable aërial trips accomplisht during the great war, in which a giant Zeppelin flew from Jamboli, in Bulgaria, to a point over Khartoum, on the river Nile in Africa, a distance as the crow flies of 2,065 miles, and a distance of *4,130 miles for the non-stop return trip*. The Zeppelin carried a crew of twenty-two men besides twenty-five tons of ammunitions and medicines for the Teuton army in German East Africa. The great craft glided from its hangar at Jamboli at eight o'clock on the morning of November 21st, 1917. On the night of November 22nd-23rd, the monster airship had arrived over Khartoum, when it picked up a wireless message from the German radio station at Nauen, ordering it to return at once, as the Government at Berlin had ascertained in the meantime that the majority of Gen. von Lettou-Worbeck's troops had surrendered to the Allies.

Consequently the air-ship turned about in mid-air *without making a landing* and arrived at Jamboli at eight o'clock in the morning on November 25th. The technical director of the factory where this aërial craft was built has stated that a ship of this type was easily capable of flying from Berlin to New York and returning *without a stop*. The air-line distance from Berlin to New York City is approximately 3,930 miles, and the round trip distance would be 7,860 miles, or nearly eight thousand miles.



Talking of dirigible gas-bag types of aircraft, the U. S. Navy Department has just announced a remarkable new gas, which is available by a new process. Discovery of this new inert, non-inflammable gas for balloons, dirigibles and other lighter-than-air craft was revealed by the Navy Department on December 9th in a statement explaining expenditures for its production now being made jointly with the army.

The department states that the use of this new element, officially termed "argon," will eliminate the hazard of fire and explosion that always has accompanied balloon operations where "hydrogen" has been used to inflate the gas bags.

The gas from which "argon" is obtained comes from the wells at Petrolia, Tex., owned by the Lone Star Gas Company, the statement said, and a ten-inch pipe line to cost $1,050,000 is being laid for a distance of ninety-four miles from the wells to a plant at North Fort Worth, where the gas will be comprest into cylinders for shipment to the balloon fields.

High proof gasoline is obtained in a ratio of about five gallons per 1,000 cubic feet of gas, it was said, and after the 1 per cent of "argon" is removed, by agreement with the oil company, the remainder of the gas is turned into the city mains of Fort Worth and Dallas.

The Department estimates that the plant at North Fort Worth, designed by the Navy Bureau of Yards and Docks, and which will cost $900,000 will be completed by April 1.

One of the Great Scientific Feats of the World-War Was the Non-Stop Flight of a German Zeppelin Over the Route Here Illustrated—a Distance of 4,130 Miles. Such a Craft Could Fly Easily From Europe to New York, and the Engineers That Built the Airship Claim That It Is Capable of Flying From Berlin to New York and Return, Without Stopping.

INJURING THE EYES BY PHOTOGRAPHY.

When one sees so many veteran photographic workers, in both amateur and professional ranks, suffering from astigmatism, one wonders what is the actual cause of this distressing optical defect. On inquiry, it will be found that in many cases the eyes were strained during the early days of dryplate-photography, when the plates—then coated with a very slow emulsion—were handled, and examined during development, by the light of a deep ruby oil-lamp. Amateurs at first used advisedly a small pocket-lamp, and undoubtedly incurred serious injury to the sight. Later—thank goodness—light of greater volume was employed, ruby light being also superseded by orange light; preferably fabric instead of glass being used to expose the dryplates sparingly to the rays of this brighter light. Now the photographer confronts the danger of ruining his eyes from exposure to the electric arc when used for printing-purposes. To look at the bare arc is obviously injurious to the sight. Arc-rays reflected from the surface of the negatives are also bad for the eyes. A good plan is to use a printing-lamp in which only reflected light reaches the negatives, or to use a printing-cabinet in which the arc is enclosed, care being taken to cover up empty spaces with pieces of cardboard so that the arc or its reflections do not reach the printer's eyes.

Famous Scientific Illusions

By NIKOLA TESLA

Written specially for the Electrical Experimenter

In this original and revolutionizing discussion, Nikola Tesla gives us something really new to think about. First—Does the moon rotate on its axis? Second—Is the Franklin pointed lightning rod correct in theory and operation? Third—Do wireless signals fly thru space by means of so-called Hertzian waves in the ether, or are they propagated thru the earth at prodigious velocity by means of earth-bound oscillations? World-famous conundrums these—questions which have been answered in many ways by some of the greatest scientists. Dr. Tesla explains these three predominant scientific fallacies in a masterly way, so that everyone can understand them.

THE human brain, with all its wonderful capabilities and power, is far from being a faultless apparatus. Most of its parts may be in perfect working order, but some are atrophied, undeveloped or missing altogether. Great men of all classes and professions—scientists, inventors, and hard-headed financiers—have placed themselves on record with impossible theories, inoperative devices, and unrealizable schemes. It is doubtful that there could be found a single work of any one individual free of error. There is no such thing as an infallible brain. Invariably, some cells or fibers are wanting or unresponsive, with the result of impairing judgment, sense of proportion, or some other faculty. A man of genius eminently practical, whose name is a household word, has wasted the best years of his life in a visionary undertaking. A celebrated physicist was incapable of tracing the direction of an electric current according to a childishly simple rule. The writer, who was known to recite entire volumes by heart, has never been able to retain in memory and recapitulate in their proper order the words designating the colors of the rainbow, and can only ascertain them after long and laborious thought, strange as it may seem.

Our organs of reception, too, are deficient and deceptive. As a semblance of life is produced by a rapid succession of inanimate pictures, so many of our perceptions are but trickery of the senses, devoid of reality. The greatest triumphs of man were those in which his mind had to free itself from the influence of delusive appearances. Such was the revelation of Buddha that self is an illusion caused by the persistence and continuity of mental images; the discovery of Copernicus that, contrary to all observation, this planet rotates around the sun; the recognition of Descartes that the human being is an automaton, governed by external influence and the idea that the earth is spherical, which led Columbus to the finding of this continent. And tho the minds of individuals supplement one another and science and experience are continually eliminating fallacies and misconceptions, much of our present knowledge is still incomplete and unreliable. We have sophisms in mathematics which cannot be disproved. Even in pure reasoning, free of the shortcomings of symbolic processes, we are often arrested by doubt which the strong-

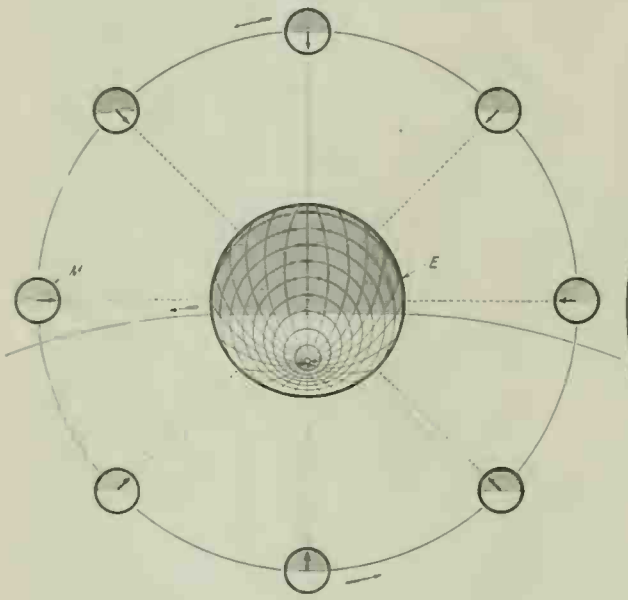

Fig. 1

It Is Well Known That the Moon, M., Always Turns the Same Face Toward the Earth, E, as the Black Arrows Indicate. The Parallel Rays From the Sun Illuminate the Moon in Its Successive Orbital Positions as the Unshaded Semi-circles Indicate. Bearing This in Mind, Do You Believe That the Moon Rotates on Its Own Axis?

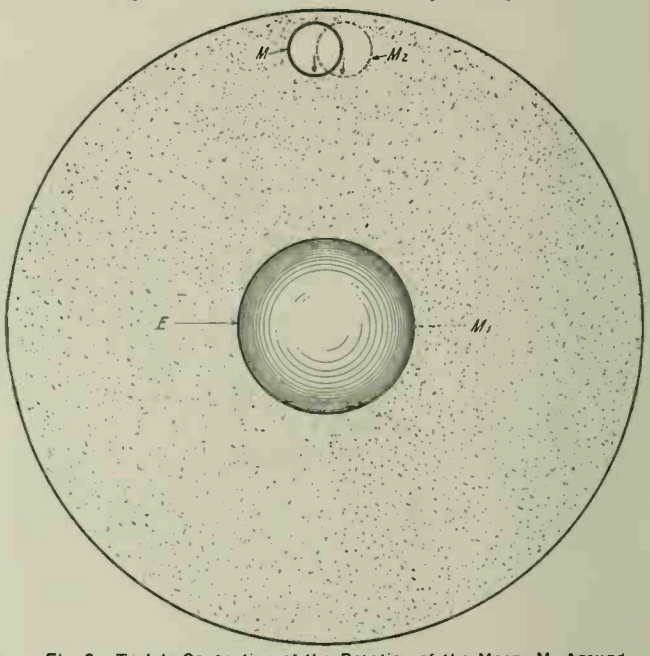

Fig. 2.—Tesla's Conception of the Rotation of the Moon, M, Around the Earth, E; the Moon, In This Demonstration Hypothesis, Being Considered as Embedded In a Solid Mass, M_1. If, As Commonly Believed, the Moon Rotates, This Would Be Equally True For a Portion of the Mass M_2, and the Part Common to Both Bodies Would Turn Simultaneously In "Opposite" Directions.

FOR over a century and a half the whole world, educated and otherwise, thought that the moon revolved around its axis. Nikola Tesla in the present highly instructive article disproves that theory and will convince scientists and all others alike that the moon does no such thing.

For thousands of years it was thought that the sun and stars revolved around the earth and all kinds of experimental proofs were furnished to substantiate this theory. The illustrious Galileo thought different, and everyone today knows that the earth revolves around the sun.

So it is with Tesla's discovery. Tesla also, in the second part of the present paper, shows us that the ancient and time-worn theory advanced by Benjamin Franklin as to the lightning conductor is not substantially correct as viewed by latter day science. It will come as a shock even to our professors that the lightning rod actually aids the lightning in hitting the building. The reason is that the lightning rod helps in ionizing (making conductive) the surrounding air.

Mr. Tesla has devised a lightning conductor with no points, and there is no doubt whatsoever that his theory is right. Scientists the world over will acknowledge this very shortly.

In a third section of the same paper Tesla explodes still another popular delusion, viz., that wireless waves follow the curvature of the earth when messages are transmitted, let us say from a point in the United States to a point in Europe. In his revolutionary arguments, supported by facts as well as by logic, Tesla shows why the currents do not travel around the earth but directly thru it. In other words, Tesla maintains that wireless communication is accomplished ONLY thru the medium of the earth itself. His contention seems very sound. If it were not so, let every wireless station, commercial or otherwise, do away with its ground connection. None could then operate as is well known, except perhaps over very limited distances.

Mr. Tesla's present article will arouse world-wide comment due to the revolutionary philosophy contained therein. We are sure our readers will appreciate Mr. Tesla's most timely and illuminating article on this but little understood subject.

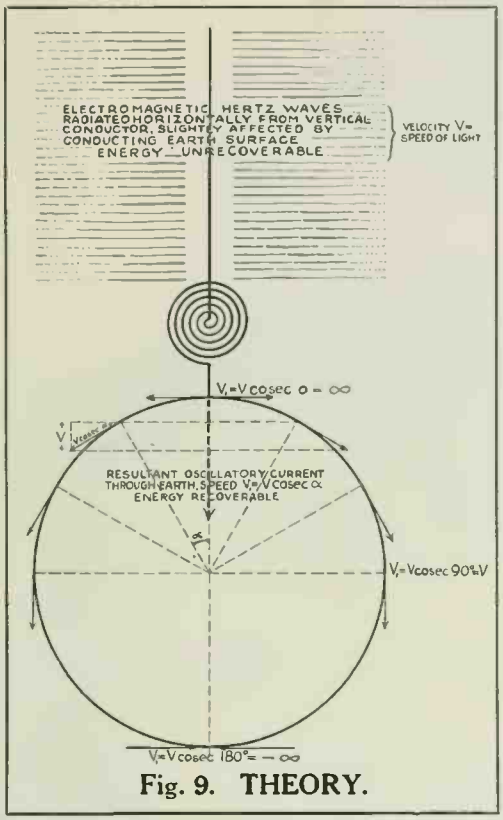
est intelligences have been unable to dispel. Experimental science itself, most positive of all, is not unfailing.

In the following I shall consider three exceptionally interesting errors in the interpretation and application of physical phenomena which have for years dominated the minds of experts and men of science.

I. The Illusion of the Axial Rotation of the Moon.

It is well known since the discovery of Galileo that the moon, in travelling thru space, always turns the same face towards the earth. This is explained by stating that, while passing once around its mother-planet the lunar globe performs just one revolution on its axis. The spinning motion of a heavenly body must necessarily undergo modifications in the course of time, being either retarded by resistances internal or external, or accelerated owing to shrinkage and other causes. An unalterable rotational velocity thru all phases of planetary evolution is manifestly impossible. What wonder, then, that at this very instant of its long existence our satellite should revolve exactly so, and not faster or slower. But many astronomers have accepted as a physical fact that such rotation takes place. It does not, but only appears so; it is an illusion, a most surprising one, too.

I will endeavor to make this clear by reference to Fig. 1, in which E represents the earth and M the moon. The movement thru space is such that the arrow, firmly attached to the latter, always occupies the position indicated with reference to the earth. If one imagines himself as looking down on the orbital plane and follows the motion he will become convinced that the moon *does* turn on its axis as it travels around. But in this very act the observer will have deceived himself. To make the delusion complete let him take a washer similarly marked and supporting it rotatably in the center, carry it around a stationary object, constantly keeping the arrow pointing towards the latter. Tho to his bodily vision the disk will revolve on its axis, such movement does not exist. He can dispel the illusion at once by holding the washer fixedly while going around. He will now readily see that the supposed axial rotation is only apparent, the impression being produced by successive changes of position in space.



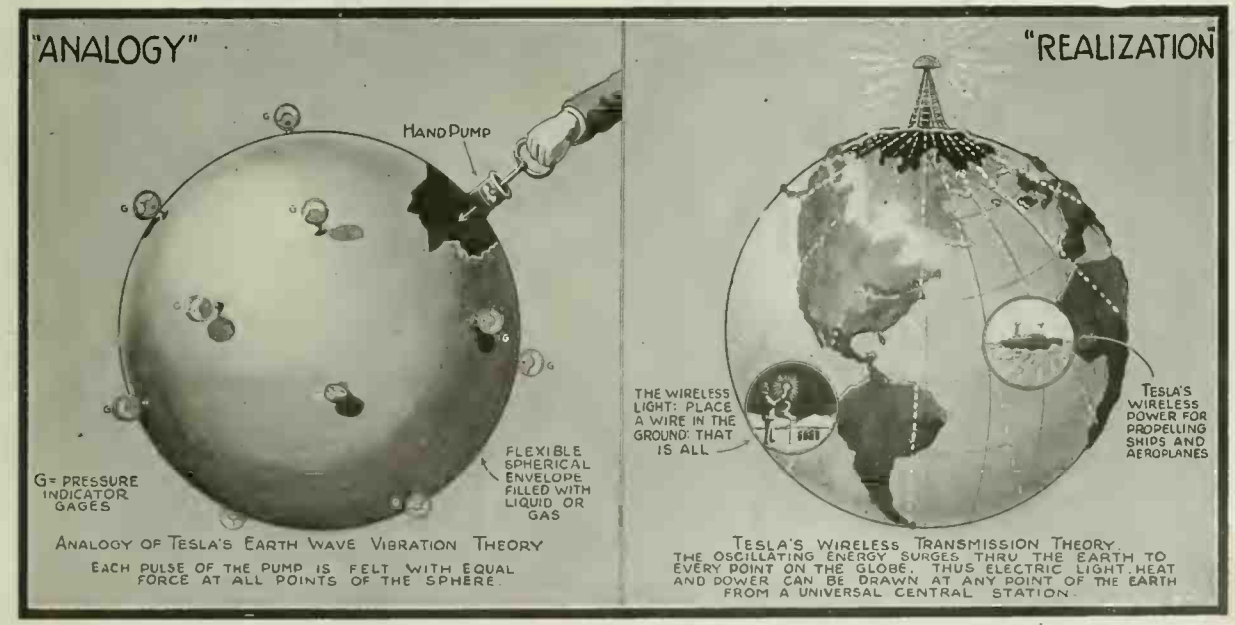


Fig. 9. THEORY.

But more convincing proofs can be given that the moon does not, and cannot revolve on its axis. With this object in view attention is called to Fig. 2, in which both the satellite, M, and earth, E, are shown embedded in a solid mass, M_1 (indicated by stippling) and supposed to rotate so as to impart to the moon its normal translatory velocity. Evidently, if the lunar globe could rotate as commonly believed, this would be equally true of any other portion of mass M_1, as the sphere M_2, shown in dotted lines, and then the part common to both bodies would have to turn *simultaneously in opposite directions*. This can be experimentally illustrated in the manner suggested by using instead of one, two overlapping rotatable washers, as may be conveniently represented by circles M and M_2, and carrying them around a center as E, so that the plain and dotted arrows are always pointing towards the same center. No further argument is needed to demonstrate that the two gyrations cannot co-exist or even be pictured in the imagination and reconciled in a purely abstract sense.

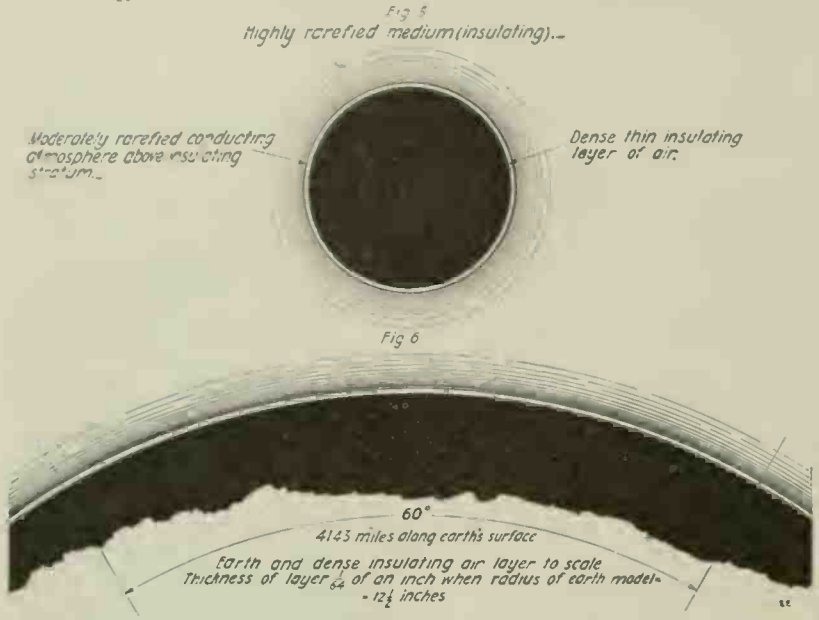
The truth is, the so-called "axial rotation" of the moon is a phenomenon deceptive alike to the eye and mind and devoid of physical meaning. It has nothing in common with real mass revolution characterized by effects positive and unmistakable. Volumes have been written on the subject and many erroneous arguments advanced in support of the notion. Thus, it is reasoned, that if the planet did *not* turn on its axis it would expose the whole surface to terrestrial view; as only one-half is visible, it *must* revolve. The first statement is true but the logic of the second is defective, for it admits of only one alternative. The conclusion is not justified as the same appearance can also be produced in another way. The moon does rotate, not on its own, but about an axis passing thru the center of the earth, the true and only one.

The unfailing test of the spinning of a mass is, however, the existence of

Tesla's World-Wide Wireless Transmission of Electrical Signals, As Well As Light and Power, Is Here Illustrated In Theory, Analogy and Realization. Tesla's Experiments With 100 Foot Discharges At Potentials of Millions of Volts Have Demonstrated That the Hertz Waves Are Infinitesimal In Effect and Unrecoverable; the Recoverable Ground Waves of Tesla Fly "Thru the Earth". Radio Engineers Are Gradually Beginning to See the Light and That the Laws of Propagation Laid Down by Tesla Over a Quarter of a Century Ago Form the Real and True Basis of All Wireless Transmission To-Day.

www.americanradiohistory.com

energy of motion. The moon is not possest of such energy. If it were the case then a revolving body as M₁ would contain mechanical energy other than that of which we have experimental evidence. Irrespective of this so exact a coincidence between the axial and orbital periods is, in itself, immensely improbable for this is not the permanent condition towards which the system is tending. Any axial rotation of a mass left to itself, retarded by forces external or internal, must cease. Even admitting its perfect control by tides the coincidence would still be miraculous. But when we remember that most of the satellites exhibit this peculiarity, the probability becomes infinitesimal.



Three theories have been advanced for the origin of the moon. According to the oldest suggested by the great German philosopher Kant, and developed by Laplace in his monumental treatise "Mécanique Céleste", the planets have been thrown off from larger central masses by centrifugal force. Nearly forty years ago Prof. George H. Darwin in a masterful essay on tidal friction furnished mathematical proofs, deemed unrefutable, that the moon had separated from the earth. Recently this established theory has been attacked by Prof. T. J. J. See in a remarkable work on the "Evolution of the Stellar Systems", in which he propounds the view that centrifugal force was altogether inadequate to bring about the separation and that all planets, including the moon, have come from the depths of space and have been captured. Still a third hypothesis of unknown origin exists which has been examined and commented upon by Prof. W. H. Pickering in "Popular Astronomy of 1907", and according to which the moon was torn from the earth when the later was partially solidified, this accounting for the continents which might not have been formed otherwise.

Undoubtedly planets and satellites have originated in both ways and, in my opinion, it is not difficult to ascertain the character of their birth. The following conclusions can be safely drawn:

1. A heavenly body thrown off from a larger one cannot rotate on its axis. The mass, rendered fluid by the combined action of heat and pressure, upon the reduction of the latter immediately stiffens, being at the same time deformed by gravitational pull. The shape becomes permanent upon cooling and solidification and the smaller mass continues to move about the larger one as tho it were rigidly connected to it except for pendular swings or librations due to varying orbital velocity. Such motion precludes the possibility of axial rotation in the strictly physical sense. The moon has never spun around as is well demonstrated by the fact that the most precise measurements have failed to show any measurable flattening in form.

2. If a planetary body in its orbital movement turns the same side towards the central mass this is a positive proof that it has been separated from the latter and is a true satellite.

3. A planet revolving on its axis in its passage around another cannot have been thrown off from the same but must have been captured.

A Section of the Earth and Its Atmospheric Envelope Drawn to Scale. It Is Obvious That the Hertzian Rays Cannot Traverse So Thin a Crack Between Two Conducting Surfaces For Any Considerable Distance, Without Being Absorbed, Says Dr. Tesla, In Discussing the Ether Space Wave Theory.

II. The Fallacy of Franklin's Pointed Lightning-Rod.

The display of atmospheric electricity has since ages been one of the most marvelous spectacles afforded to the sight of man. Its grandeur and power filled him with fear and superstition. For centuries he attributed lightning to agents god-like and supernatural and its purpose in the scheme of this universe remained unknown to him. Now we have learned that the waters of the ocean are raised by the sun and maintained in the atmosphere delicately suspended, that they are wafted to distant regions of the globe where electric forces assert themselves in upsetting the sensitive balance and causing precipitation, thus sustaining all organic life. There is every reason to hope that man will soon be able to control this life-giving flow of water and thereby solve many pressing problems of his existence.

Atmospheric electricity became of special scientific interest in Franklin's time. Faraday had not yet announced his epochal discoveries in magnetic induction but static frictional machines were already generally used in physical laboratories. Franklin's powerful mind at once leaped to the conclusion that frictional and atmospheric electricity were identical. To our present view this inference appears obvious, but in his time the mere thought of it was little short of blasphemy. He investigated the phenomena and argued that if they were of the same nature then the clouds could be drained of their charge exactly as the ball of a static machine, and in 1749 he indicated in a publisht memoir how this could be done by the use of pointed metal rods.

Curing Soldiers' Ills with Electricity

By PAULINE BERGINS

ELECTRICITY is playing no mean rôle in the vast reconstruction work now being carried on in the great Red Cross as well as Army and Navy hospitals thruout the country. Not only has the electric current been cleverly employed in many diversified ways to treat the many ills and maladies with which the soldiers and sailors have been afflicted in this country, but thousands of these appliances have been and are being used every day in the field hospitals in France, and in other lands which were not many months ago raging battlefields. Portable yet powerful X-ray ambulances sped over the battlefields but a few miles behind the front line trenches, ever ready to loan a helping hand in the merciful work of the medical corps. And not only do we find in these shell-torn regions the invaluable

Three Interesting Views Showing Electricity's Role In the Reconstruction Work of the Army Hospitals. Above: Fig. 2, Soldier Patient Receiving Electric Arm Bath Treatment For Rheumatism, at the American Red Cross War Hospital at Paignton, Devon, France. Fig. 1, Below, Shows American Soldier Being Treated in the Bergonié Electric Chair, Extensively Used for Shell Shock Treatment, at Fort MacPherson, Ga. Fig. 3, at Left, Illustrates the Electric Light Bath Cabinet in Use. A Wounded Marine Is Enjoying the Glowing Warmth Produced By This Electrotherapeutic Apparatus For Treating Sore and Stiffened Muscles.

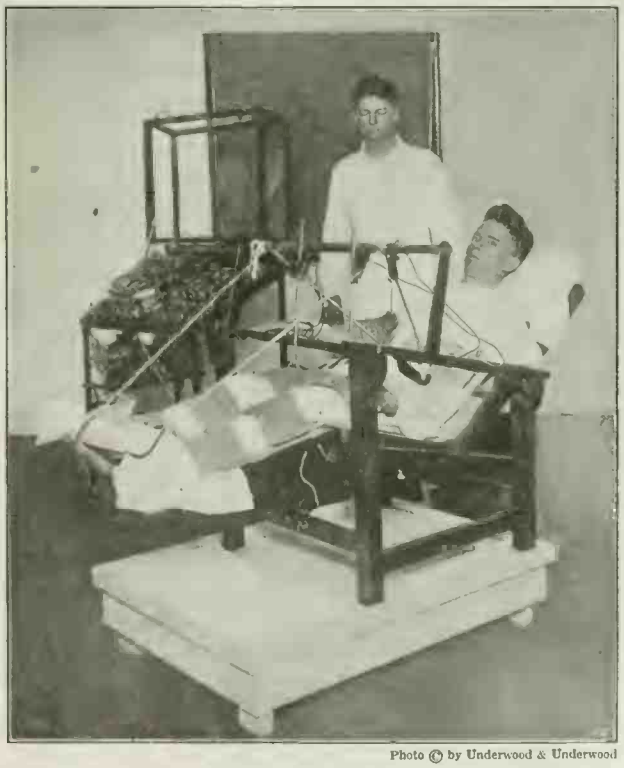

Photo © by Underwood & Underwood

X-ray machines, but many other appliances such as electric heating devices for the treatment of "trench feet", electric sterilizers and cauterizers, Faradic outfits for the treatment of lameness and rheumatism, electric light baths, etc.

The accompanying photographs show several very interesting and practical applications of the electric current for the treatment of war ills. The photograph, Fig. 1, showing an American soldier seated in the large reclining chair, was taken at Fort MacPherson, Ga. This curious and complicated looking electric outfit comprises one of the most wonderful electro-medical devices ever invented—the "Bergonié" Electric Chair. The Bergonié invention involves the application of low voltage electric currents of peculiar wave form to the patient's body while seated in the chair here shown, the body being weighted with a number of sand bags. The switch-board in the background contains a number of regulating rheostats and motor-driven interrupters as well as measuring instruments, such as a voltmeter and milliampere meter for indicating the strength of the current applied to the patient. The Bergonié chair treatment produces rythmic pulsations in the nerves and muscles and has been found very efficacious for shell-shock victims as well as for treating severe nervous cases caused by excessive fatigue, and for over-strained muscles and cords.

There are more shell-shock victims from this great World War than there have been in any other. And therefore, the fact that the Bergonié electric chair will help to alleviate and cure these cases, is indeed a great blessing.

It might be said that the majority of shell-shock victims lose a part or all of their mental faculties, and to all appearances cannot use their reason at all. They have all sorts of delusions as to whom their folks are, or where their home is. Practically everyone has heard of, or has been in contact with, one or more cases of shell-shock, and so it is not necessary to expatiate further on this important phase of the problem of reconstruction, except to say that the various hospitals and sanitariums engaged in this work are doing wonders over night, literally as well as metaphorically, for some of these cases of shell-shock are cured suddenly and instantly by the most peculiar incident or happening. In a large French hospital just prior to the signing of the armistice there

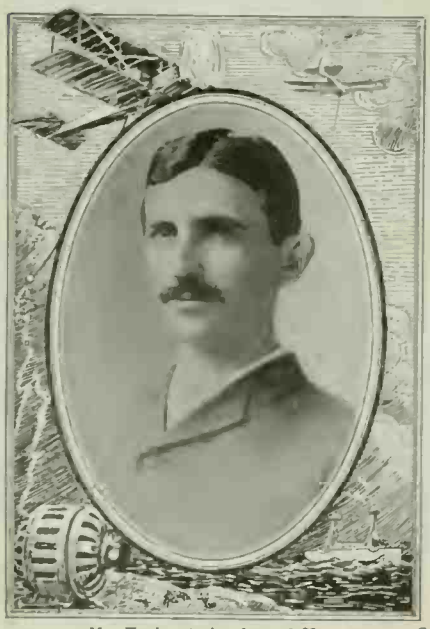
My Inventions

By Nikola Tesla

1. MY EARLY LIFE

THE progressive development of man is vitally dependent on invention. It is the most important product of his creative brain. Its ultimate purpose is the complete mastery of mind over the material world, the harnessing of the forces of nature to human needs. This is the difficult task of the inventor who is often misunderstood and unrewarded. But he finds ample compensation in the pleasing exercises of his powers and in the knowledge of being one of that exceptionally privileged class without whom the race would have long ago perished in the bitter struggle against pitiless elements.

Speaking for myself, I have already had more than my full measure of this exquisite enjoyment, so much that for many years my life was little short of continuous rapture. I am credited with being one of the hardest workers and perhaps I am, if thought is the equivalent of labor, for I have devoted to it almost all of my waking hours. But if work is interpreted to be a definite performance in a specified time according to a rigid rule, then I may be the worst of idlers. Every effort under compulsion demands a sacrifice of life-energy. I never paid such a price. On the contrary, I have thrived on my thoughts.

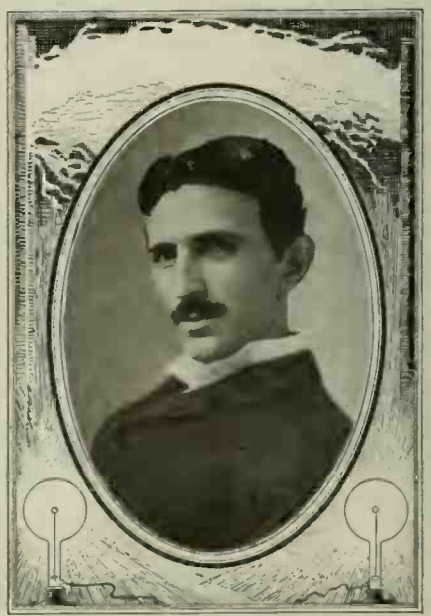


In attempting to give a connected and faithful account of my activities in this series of articles which will be presented with the assistance of the Editors of the ELECTRICAL EXPERIMENTER and are chiefly addrest to our young men readers, I must dwell, however reluctantly, on the impressions of my youth and the circumstances and events which have been instrumental in determining my career.

Our first endeavors are purely instinctive, promptings of an imagination vivid and undisciplined. As we grow older reason asserts itself and we become more and more systematic and designing. But those early impulses, tho not immediately productive, are of the greatest moment and may shape our very destinies. Indeed, I feel now that had I understood and cultivated instead of suppressing them, I would have added substantial value to my bequest to the world. But not until I had attained manhood did I realize that I was an inventor.

This was due to a number of causes. In the first place I had a brother who was gifted to an extraordinary degree—one of those rare phenomena of mentality which biological investigation has failed to explain. His premature death left my parents disconsolate. We owned a horse which had been presented to us by a dear friend. It was a magnificent animal of Arabian breed, possest of almost human intelligence, and was cared for and petted by the whole family, having on one occasion saved my father's life under remarkable circumstances. My father had been called one winter night to perform an urgent duty and while crossing the mountains, infested by wolves, the horse became frightened and ran away, throwing him violently to the ground. It arrived home bleeding and

Nikola Tesla at the Age of 23.
From An Unpublished Photograph.



Mr. Tesla at the Age of 29.

HOW does the world's greatest inventor invent? How does he carry out an invention? What sort of mentality has Nikola Tesla? Was his early life as commonplace as most of ours? What was the early training of one of the World's Chosen? These, and many other very interesting questions are answered in an incomparable manner by Nikola Tesla himself in this, his first article.

In his autobiography, treating mainly on his early youth, we obtain a good insight into the wonderful life this man has led. It reads like a fairy tale, which has the advantage of being true. For Tesla is no common mortal. He has led a charmed life—struck down by the pest, the cholera and what not—given up by doctors at least three times as dead—we find him at sixty, younger than ever. But—read his own words. You have never read the like before.

Mr. Tesla at the Age of 39.

www.americanradiohistory.com

exhausted, but after the alarm was sounded immediately dashed off again, returning to the spot, and before the searching party were far on the way they were met by my father, who had recovered consciousness and remounted, not realizing that he had been lying in the snow for several hours. This horse was responsible for my brother's injuries from which he died. I witnest the tragic scene and altho fifty-six years have elapsed since, my visual impression of it has lost none of its force. The recollection of his attainments made every effort of mine seem dull in comparison.

Anything I did that was creditable merely caused my parents to feel their loss more keenly. So I grew up with little confidence in myself. But I was far from being considered a stupid boy, if I am to judge from an incident of which I have still a strong remembrance. One day the Aldermen were passing thru a street where I was at play with other boys. The oldest of these venerable gentlemen—a wealthy citizen—paused to give a silver piece to each of us. Coming to me he suddenly stopt and commanded, "Look in my eyes." I met his gaze, my hand outstretched to receive the much valued coin, when, to my dismay, he said, "No, not much, you can get nothing from me, you are too smart." They used to tell a funny story about me. I had two old aunts with wrinkled faces, one of them having two teeth protruding like the tusks of an elephant which she buried in my cheek every time she kist me. Nothing would scare me more than the prospect of being hugged by these as affectionate as unattractive relatives. It happened that while being carried in my mother's arms they asked me who was the prettier of the two. After examining their faces intently, I answered thoughtfully, pointing to one of them, "This here is not as ugly as the other."

Then again, I was intended from my very birth for the clerical profession and this thought constantly opprest me. I longed to be an engineer but my father was inflexible. He was the son of an officer who served in the army of the Great Napoleon and, in common with his brother, professor of mathematics in a prominent institution, had received a military education but, singularly enough, later embraced the clergy in which vocation he achieved eminence. He was a very erudite man, a veritable natural philosopher, poet and writer and his sermons were said to be as eloquent as those of Abraham a Sancta-Clara. He had a prodigious memory and frequently recited at length from works in several languages. He often remarked playfully that if some of the classics were lost he could restore them. His style of writing was much admired. He penned sentences short and terse and was full of wit and satire. The humorous remarks he made were always peculiar and characteristic. Just to illustrate, I may mention one or two instances. Among the help there was a cross-eyed man called Mane, employed to do work around the farm. He was chopping wood one day. As he swung the axe my father, who stood nearby and felt very uncomfortable, cautioned him, "For God's sake, Mane, do not strike at what you are looking but at what you intend to hit." On another occasion he was taking out for a drive a friend who carelessly permitted his costly fur coat to rub on the carriage wheel. My father reminded him of it saying, "Pull in your coat, you are ruining my tire." He had the odd habit of talking to himself and would often carry on an animated conversation and indulge in heated argument, changing the tone of his voice. A casual listener might have sworn that several people were in the room.

Altho I must trace to my mother's influence whatever inventiveness I possess, the training he gave me must have been helpful. It comprised all sorts of exercises—as, guessing one another's thoughts, discovering the defects of some form or expression, repeating long sentences or performing mental calculations. These daily lessons were intended to strengthen memory and reason and especially to develop the critical sense, and were undoubtedly very beneficial.

My mother descended from one of the oldest families in the country and a line of inventors. Both her father and grandfather originated numerous implements for household, agricultural and other uses. She was a truly great woman, of rare skill, courage and fortitude, who had braved the storms of life and past thru many a trying experience. When she was sixteen a virulent pestilence swept the country. Her father was called away to administer the last sacraments to the dying and during his absence she went alone to the assistance of a neighboring family who were stricken by the dread disease. All of the members, five in number, succumbed in rapid succession. She bathed, clothed and laid out the bodies, decorating them with flowers according to the custom of the country and when her father returned he found everything ready for a Christian burial. My mother was an inventor of the first order and would, I believe, have achieved great things had she not been so remote from modern life and its multifold opportunities. She invented and constructed all kinds of tools and devices and wove the finest designs from thread which was spun by her. She even planted the seeds, raised the plants and separated the fibers herself. She worked indefatigably, from break of day till late at night, and most of the wearing apparel and furnishings of the home was the product of her hands. When she was past sixty, her fingers were still nimble enough *to tie three knots in an eyelash.*

There was another and still more important reason for my late awakening. In my boyhood I suffered from a peculiar affliction due to the appearance of images, often accompanied by strong flashes of light, which marred the sight of real objects and interfered with my thought and action. They were pictures of things and scenes which I had really seen, never of those I imagined. When a word was spoken to me the image of the object it designated would present itself vividly to my vision and sometimes I was quite unable to distinguish whether what I saw was tangible or not. This caused me great discomfort and anxiety. None of the students of psychology or physiology whom I have consulted could ever explain satisfactorily these phenomena. They seem to have been unique altho I was probably predisposed as I know that my brother experienced a similar trouble. The theory I have formulated is that the images were the result of a reflex action from the brain on the retina under great excitation. They certainly were not hallucinations such as are produced in diseased and anguished minds, for in other respects I was normal and composed. To give an idea of my distress, suppose that I had witnest a funeral or some such

(Continued on page 743)

NIKOLA TESLA
THE MAN
By H. Gernsback

THE door opens and out steps a tall figure—over six feet high—gaunt but erect. It approaches slowly, stately. You become conscious at once that you are face to face with a personality of a high order. Nikola Tesla advances and shakes your hand with a powerful grip, surprising for a man over sixty. A winning smile from piercing light blue-gray eyes, set in extraordinarily deep sockets, fascinates you and makes you feel at once at home.

You are guided into an office immaculate in its orderliness. Not a speck of dust is to be seen. No papers litter the desk, everything just so. It reflects the man himself, immaculate in attire, orderly and precise in his every movement. Drest in a dark frock coat, he is entirely devoid of all jewelry. No ring, stickpin, or even watch-chain can be seen.

Tesla speaks—a very high almost falsetto voice. He speaks quickly and very convincingly. It is the man's voice chiefly which fascinates you.

As he speaks you find it difficult to take your eyes off his own. Only when he speaks to others do you have a chance to study his head, predominant of which is a very high forehead with a bulge between the eyes—the neverfailing sign of an exceptional intelligence. Then the long, well-shaped nose, proclaiming the scientist.

How does this man, who has accomplished such a tremendous work, keep young and manage to surprise the world with more and more new inventions as he grows older? How does this youth of sixty, who is a professor of mathematics, a great mechanical and electrical engineer and the greatest inventor of all times, keep his physical as well as remarkable mental freshness?

To begin with, Tesla, who is by birth a Serbian, comes from a long-lived hardy race. His family tree abounds with centenarians. Accordingly, Tesla—barring accidents—fully expects to be still inventing in A. D. 1960.

But the chief reason for his perpetual youth is found in his gastronomical frugality. Tesla has learned the great fundamental truth that most people not only eat all of their bodily ills, but actually eat themselves to death by either eating too much or else by food that does not agree with them.

When Tesla found out that tobacco and black coffee interfered with his physical well-being, he quit both. This is the simple daily menu of the great inventor:

Breakfast: One to two pints of warm milk and a few eggs, prepared by himself—yes, he is a bachelor!

Lunch: None whatsoever, as a rule.

Dinner: Celery or the like, soup, a single piece of meat or fowl, potatoes and one other vegetable; a glass of light wine. For dessert, perhaps a slice of cheese, and invariably a big raw apple. And that's all.

Tesla is very fussy and particular about his food: he eats very little, but what he does eat must be of the very best. And he knows, for outside of being a great inventor in science he is an accomplished cook who has invented all sorts of savory dishes.

His only vice is his generosity. The man who, by the ignorant onlooker has often been called an idle dreamer, has made over a million dollars out of his inventions—and spent them as quickly on new ones. But Tesla is an idealist of the highest order and to such men money itself means but little.

www.americanradiohistory.com

Subways of Down-Town New York

THE down-town section of lower New York, including the financial or banking district in the vicinity of Wall and Broad Streets, and other well-known thorofares, such as Broadway and the Bowling Green section, bids fair to become the most thoroly subwayed section of any city in the world. A glance at the accompanying illustration, prepared by Mr. George Wall, a well-known New York artist, shows clearly some of the most ingenious engineering features connected with the gigantic subway plans which have been worked out for this narrow strip of land, which constitutes one of the most thickly populated districts anywhere in the world. Here office buildings rise twenty to thirty stories in the air, —while the heavy steel trains rumble along thru the bowels of the earth under these gigantic business structures day and night. Lucky for New York that it has a very solid rock foundation, or it is doubtful if all the ambitious subway and other arteries of travel now in operation and contemplated, could be operated with any degree of safety. In preparing the accompanying illustration, courtesy is due to the engineers of the Public Service Commission, who have supplied the necessary information concerning the various subway routes here illustrated, several of which are now under construction and not just yet in operation.

In looking at this illustration of down-town New York, the well-known "battery loop" section is shown at the bottom, the top of the illustration being north, the bottom south, and the right and left—east and west respectively. The insert map shows the general plan of the subway systems including the Hudson Tubes under the North River, as well as the Pennsylvania Railroad Tunnels under the North and East Rivers. Beginning at the west side of the perspective view we come to the new West Side Subway, sometimes referred to as the 7th Avenue Subway. This is a two-track underground railway, which runs under the 9th Avenue Elevated Railroad, as becomes apparent. A down-town train moving toward the Battery, on the West Side track, passes down around the loop on the outer or "A" track, and after it has past the Battery Subway Station, goes down an incline so as to complete its loop, two levels underground, thru a tunnel which passes under the East Side Subway (which runs on Broadway in this district) and comes out on the up-town track running north, as the second arrow "A" indicates. Right here we have one of the most unique and clever bits of subway engineering imaginable, for this two-track system fulfills two important functions.

Firstly, and as just explained, it serves as the *return loop* for the trains of the West Side Subway. Secondly, the inner track of this battery loop, or track "B," is used to return the local trains of the East Side Subway (also referred to as the old Broadway Subway), and by following the inner or "B" track around the loop, by means of the dotted lines, it will be seen that the down-town or south-bound local train can complete the loop, and eventually swing around on to the north-bound local track. The two center tracks of the East Side Subway go to Brooklyn, and are the express tracks. As the dotted lines convey, these trains dive downward two levels and pass thru the two westerly East River Tubes, one of the tubes carrying the trains to Brooklyn, and the other the trains returning from Brooklyn to New York. The East Side Subway is the older one, and the one that visitors are most familiar with and until recently,—when the change was made to the subway shuttle service between the Grand Central station and Times Square, due to the opening of the West Side Subway,—the route of the East Side Subway trains was northward from the Brooklyn Bridge terminus along Fourth Avenue, to Park Avenue, Grand Central station, thence westward under 42nd Street, then northward along Broadway, etc. At the present time, owing to the change caused by the shuttle service put into effect between the Grand Central and Times Square stations, these trains make a turn to the eastward, at Grand Central station, and then proceed northward along Lexington Avenue.

The next subway of interest is the new Triboro Subway, which is often referred to as the B. R. T. Subway, but the official name given to it just recently, is the *Triboro Subway System*. These trains will come from Brooklyn thru two new under-river tubes shown in the illustration, and proceed along under Whitehall Street at a depth of two levels, so as to pass under the East Side Subway, as the illustration clearly shows. The most southerly point of operation at the present time, is the Whitehall Street station. Passengers going south transfer at Canal Street for Brooklyn. This subway passes along Church Street, and there is a station in the Hudson Terminal Building. Somewhat north of this, it makes a turn eastward and passes back to Broadway, and from here it runs north along Broadway to Times Square. At this point there is a station two levels underground with communicating passageways, so that at this interesting transfer station a passenger may take one of several subway routes, to up-town or down-town New York, or to Brooklyn, as well as to Queens, *via* the Queensboro Subway, which operates from the Grand Central Station under the East River, thru the Steinway tunnel.

The Triboro Subway makes a turn north-eastward at 44th Street, and then runs under Seventh Avenue directly north to 59th Street, then proceeds eastward across New York at the south side of Central Park, and passes under the East River to Queens.

Referring to the two river tubes down at the Battery where the Pump Station and Construction Shaft are shown, it is interesting to note that but two tunnels will be utilized at this point to take care of four distinct arteries of subway traffic, i.e., the Brooklyn-bound subway trains from the Triboro line, as well as those from the Nassau-Broad Street Subway, as the arrows indicate; while the other East River Tube takes care of New York-bound subway trains for the Triboro and Nassau-Broad Streets Subways. This remarkable engineering feat is taken care of by means of two interlocking two-way switches in the switch bulkheads shown at this point, and, of course, a very elaborate system of interlocking switches and signals has been provided in order to prevent any collisions, as may well be imagined. It must be said to the credit of the New York Subway System, that there have been very few accidents, and these were very slight, due to the fact that very accurate and cleverly conceived electrical safety systems are in use, whereby one train cannot pass into the next "block," while it is still occupied by another train.

At present the two westerly under-river tubes leading to the Triboro Subway at the Battery are finished and ready for use, but the two easterly branches are dead-ended a short way underground, in the vicinity of the Construction Shaft.

The "Interboro" William Street Subway will soon be completed and connects with the West Side Subway, running across town at Park Place, diving underneath the East Side Subway in order to reach its destination. The William Street Subway will pass thru the Clark Street Tunnel to Brooklyn (under the East River), and will connect with the present I. R. T. system in Brooklyn between Borough Hall and Hoyt Street stations. This tunnel takes its name from Clark Street, Brooklyn.

In this illustration, the several modes of travel available in New York City are vividly depicted by the artist, including the surface or trolley cars which run along the various streets, as well as under the elevated railways. In the Battery district, here illustrated, the 6th Avenue and 9th Avenue elevated roads are shown just below Rector Street, the 6th Avenue and 9th Avenue "L" lines branching into one another, and run as a single system down to the Battery Station, which is just above the Battery Subway Station. A similar plan is followed in the operation of the 2nd and 3rd Avenue "L" lines, as the illustration indicates. Thus two lines run as a single system from the Battery "L" Station up to a short way past the Brooklyn Bridge, where they branch out into two distinct lines of traffic. From this point one elevated system runs along 2nd Avenue and the other along 3rd Avenue.

PUBLISHER'S ANNOUNCEMENT

Beginning with this issue the type size of ELECTRICAL EXPERIMENTER *pages is increased from* 10 *to* 10½ *inches. This adds an equivalent of over four pages of live articles to your magazine, and we hope that you will welcome the improvement.*

WHAT IS AN ENGINEER?—ASK UNCLE SAM.

Especially interesting, from the standpoint of the war, is the publication of a new definition of the engineer which has been written by A. H. Krom, director of engineering, United States Employment Service, Chicago. The definition comes as the result of the many queries that have originated thru a confusion of engineering terms and standards now in general use. After serious study and consultation with eminent, authorities, Mr. Krom prepared the following definition:

"An engineer is one who economically directs man power and, by scientific design, utilizes the forces and materials of nature for the benefit of mankind."

In writing this definition, Mr. Krom hopes to offer a practical, workable statement that will be of real value to technical men and to employers of technical men. The definition will doubtless be useful in clarifying popular misconceptions. Students of engineering and prominent scientific authorities declare that Mr. Krom's definition is representative of the highest engineering ideals and that it covers all classes of engineering. In view of the importance of the engineer in the present war, it is highly important that his status be properly defined.

Popular Astronomy

THE MILKY WAY

By ISABEL M. LEWIS

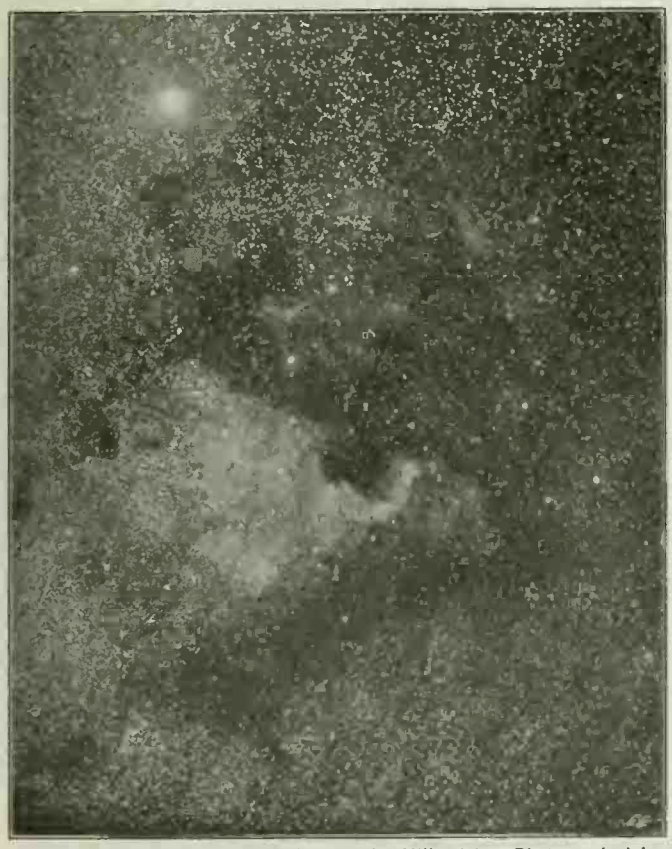
OF THE U. S. NAVAL OBSERVATORY

Taken by Barnard with the 3.4-inch Lens of the Bruce Telescope Temporarily Located on Mt. Wilson, Cal. This Photograph Shows the Great Star Clouds of the Milky Way in Sagittarius. It Is In This General Direction that the Center of the Entire Galactic System Is Believed to Be Located.

THE Galaxy or Milky Way defines in the heavens the position of the fundamental plane of the visible universe and the equatorial belt of the celestial sphere. Our own sun, attended by its planet family, is but one of the innumerable stars that stream to and fro in paths as yet undefined in form, but lying closely confined to the galactic regions and apparently controlled by the strong gravitational forces that exist therein. In fact all celestial objects, whether stars, nebulae or star clusters, are influenced by the Milky Way and as a result either crowd closely toward it or seek to avoid it so far as possible. Among the objects that particularly favor the Galaxy are to be counted the helium or blue stars and the hydrogen or white stars. The giant red stars known as the *type N* stars are found almost exclusively here as are also the stars that appear to form the connecting link between stars and nebulae—the *Wolf-Rayet* stars. Here also are to be found all the gaseous nebulae, all the temporary stars, except those that have appeared in spiral nebulae, and all the loosely-formed groups or clusters of stars, such as the *Hyades* and the *Ursa Major* group, which includes *Sirius* and the brighter stars of the *Big Dipper*.

The average width of this equatorial belt of the celestial sphere has been placed at approximately twelve thousand light years, according to most recent investigations, while its diameter is now known to be at least *three-hundred thousand light years in extent*. Outside this central segment, but symmetrically distributed with reference to it, lie the vast compact systems known as the globular star clusters. Tho limited in number to less than one hundred they are composed individually of thousands, if not hundreds of thousands, of stars far superior to our own sun in size and brilliancy. The spiral nebulae, to be counted by numbers running into the hundreds of thousands, and the Greater and Lesser Magellanic clouds of the southern hemisphere, vast systems of stars and nebulosities resembling fragments of the Milky Way in appearance, are also to be included in the objects that avoid the vicinity of the Milky Way. All of these objects are characterized by extremely high velocities compared with the sluggishly moving members of the Milky Way. Their distances from the Galaxy, moreover, are inconceivably great. An estimate of the distance of the Lesser Magellanic cloud, and which is extremely reliable, places it *thirty thousand light years* away while the average distance of the globular star clusters from the central plane of the Milky Way is more than *twenty thousand light years*. Tho the distances of the spiral nebulae are still in doubt these objects are believed to be as far away on the average as the globular clusters. The theory has been advanced by Dr. Shapley of the Mt. Wilson Solar Observatory as a result of his extensive investigations of the globular star clusters and their relations to the Milky Way, that these vast systems and probably also the spiral nebulae are not found in the vicinity of the Milky Way because it would be impossible for them either to form or to exist as independent systems in the strong gravitational field of the equatorial belt. The loosely-formed star clusters that are to be found in profusion within the Milky Way may be, he considers, the remnants of compact globular clusters that have attempted to cross the central plane.

For many years it has been doubtful whether the numberless tiny points that make up the star clouds of the Milky Way are suns comparable in size to our own sun or mere star-dust, that is, fragmentary matter of planetary rather than stellar dimensions. It is now believed that thruout the length and breadth of the Milky Way the stars average the same as they do in the immediate neighborhood of the sun. There are in the star clouds of the Galaxy giant suns that surpass our own sun hundreds and even thousands of times in size and brilliancy, and there are on the other hand dwarf suns that possess only a hundredth, a thousandth or, in some instances, a ten-thousandth part of the luminosity of the sun.



Star Clouds in Sagittarius. Photographed by Mr. Barnard of the Yerkes Observatory. This Covers a Field of About Twenty Degrees.

www.americanradiohistory.com

The hazy, milky light of the Galaxy is a familiar feature to all who have seen it at its best over sea or prairie on a moonless night of early fall, spanning the heavens in a glorious arch of awe-inspiring beauty. With the aid of the most powerful telescopes the nebulous background is resolved into innumerable individual points of light, each representing a star of the universe, a sun attended possibly by planet-worlds of its own. The impression one receives of dense clouds of stars is due, it is believed, to the great extent of the galaxy in the fundamental plane rather than to an actual crowding together of the stars. The Milky Way is known to be extremely intricate and irregular in form. It encircles the heavens in the form of a great circle, but its width varies from twenty or thirty degrees in some parts of the heavens down to barely five degrees in others. For nearly one-third of its circumference it divides into two branches. In the constellation *Argo* in the southern hemisphere, it separates into several branches crost by dark lanes that in one portion of its path nearly sever it completely. Still further south, in the vicinity of the Southern Cross, is the noted Coalsack, a huge opening in the midst of dense star clouds. The dark markings that are such a characteristic feature of the Milky Way are due in some instances to actual breaks in the star formations thru which it is possible to gaze into the immensity of space beyond, in others to the presence of dark absorbing matter that intercepts the light from the more distant star strata. There are numberless examples of such dark nebulae intermingled with vast star formations and luminous gaseous nebulae. There are all gradations in these dusky markings from an inky blackness to the greyish tinge produced by a feebly glowing nebular light. The form assumed by the star streams of the Milky Way is still unknown. There is no clue to the structure of the whole in the infinite variety of its intricate formations. No two portions of the Galaxy are alike. There is no way of determining the relative distances of the various star clouds when even the nearest are immeasurably distant. It is the comparatively recent investigations of the globular star clusters, which have been found to be symmetrically arranged with reference to the plane of the Milky Way, that have furnished a clue to the great extent of the Galaxy in the central plane of the visible universe amounting to a distance of approximately three hundred thousand light years, a value far greater than any previously assigned to celestial distances. Within six thousand light years of the central plane and fairly evenly distributed above and below it, are to be found nearly all of the stars so far catalogued, including all the naked-eye stars and, in addition, all the irregular and planetary gaseous nebulae.

Photographed by Barnard with the 10-Inch Lens of the Bruce Telescope While Temporarily Located on Mt. Wilson, Cal. (May 8, 1905, Exposure 3 h. 30 m.). This Photograph Shows About 13° of the Sky North of Theta Ophiuchi. Considered the Most Extraordinary of All the Regions of Dark Markings in the Milky Way.

Still Another View of the Wonders of the Milky Way, Photographed by Mr. Barnard. The White Spot at the Upper Left Is a Small Nebula.

In Fig. 1 is shown a section of the celestial sphere made by a plane perpendicular to the plane of the Milky Way. The crosses represent the positions of some of the globular star clusters projected upon this plane. The equatorial section, A-B, is twelve thousand light years in width and three hundred thousand light years in diameter. Midway between its upper and lower limits lies the plane of the Milky Way the pole of which is at P. C marks the center of the entire system and the globular clusters are distributed symmetrically with reference to this point. The center of the black dot, S, defines the position of our solar system in the Milky Way. The small black dot has a radius of about 1,500 light years. Within a sphere of this radius with a center at the sun lie all stars and nebulae with parallaxes greater than two thousandths of a second of arc. Therefore within the black dot lie all the stars and nebulae, the distances of which have been determined by direct means, that is practically all the stars visible to the *naked eye*, including such well-known stars as Capella, Vega, Antares, Polaris and, of course, Sirius and Alpha Centauri. Even the most massive stars of the Galaxy, thousands and tens of thousands of times more luminous than the sun, appear blended in indistinct milky light at the distance of C. Only the great telescopes break this misty light up into minute distinctive points of light of the *sixteenth* or *seventeenth stellar magnitudes*. These stars form the characteristic star clouds of the Milky Way and it is readily seen from the diagram why one receives the impression of great star density when gazing in the direction of C, from the position of the solar system at S, tho the actual star density may be nearly uniform

Women Now Trained as Meter Readers

Can women read electric meters satisfactorily? They can. Even when the meters are located in the darkest cellars. All of which has come to pass because the government had indicated that industries must help produce the needed additional military man power, and a Chicago electric light company has begun to train and employ women as meter readers. To train these new employees a temporary meter readers' school in charge of the foreman of meter readers has been opened. The equipment consists of chairs and tables, an exhibit of a number of meters and parts of meters, and a large model of a meter dial. This latter is used in meter reading practise, and examinations are held after the class has been thoroly instructed by talks accompanied by demonstrations concerning the construction and working of meters. Twenty or thirty changes are made on the large dial, each student marking down her record each time on a sheet of paper. These sheets are then collected and marked up by the instructor.

Here's a Class of Women Meter Readers Being Taught the Errors and Ways of One-Stepping Watt-Hour Meters. "The Hand Is Quicker Than the Eye," Says the Instructor. It Points to 7, but It's Only 6! What the —— ?X! That's Why They have a School. Incidentally They Are Trained How to Shoot Rats at Forty Paces.

TORPEDO TURNS TO STRIKE SHIP.

The case of the Norwegian steamer Somerstadt, which was sunk on August 12th off Fire Island by a *recurving torpedo*, as stated in the official report, has raised the question among experts as to whether the Germans have not utilized the American invention of radio or wireless-directed missiles of that character.

While there is nothing in the official report to indicate that the torpedo which destroyed the steamer took its eccentric course of passing the bow and returning to strike fatally on the port side by the use of radio power, it is not denied that such might be the case.

Secretary Daniels called in an expert when the matter was discust at Washington. In the latter's opinion there was nothing remarkable about the return of the torpedo.

He explained that there were well-known mechanical devices, such as the gyroscope, by which a torpedo could be made to go forward from the point of departure for a certain distance and then recurve, as in the present case.

Both the Army and Navy have investigated the directing of torpedoes by wireless from shore, and have found they can be given such direction. One of the inventions which attracted much attention some few years ago in this line was that of John Hays Hammond, Jr. Tests were made off Sandy Hook, and the torpedoes were given practically any desired direction.

It is noted today that the case of the Somerstadt is not the first instance of the boomerang motion of a torpedo. The same effect was produced in the submarine attack on the steamship Antilles and on the destroyer Jones.

Officials therefore are inclined to the belief that the Germans would not put any additional radio service on board a submarine to guide torpedoes when they could be directed just as well by the gyroscope plan.

An electric lighting company in New Orleans, La., has devised a portable electric light attached to a long pole. The pole is pushed into the ground and the attaching cord connected to the nearest lighting socket. The light is used for illuminating gardens, tennis courts and lawn parties.

The greater efficiency of electric cooking and the consequent conservation of fuel was pointed out in a recent article in *Elektro-Technich and Maschinenbau.* Cases are cited of bakeries in which, other factors being as nearly as possible identical, steam ovens used 0.19 to 0.21 kg. of coal per kg. of bread (i.e., 955 to 1,060 calories), while electric ovens used 0.39 to 0.42 kw-hr. per kg. of bread (i.e., 322 to 359 calories). The power consumption of the electric ovens was 90 kw. and 50 kw. respectively.

SCIENCE IN THE EVOLUTION OF BIG GUNS AND SHELL.

The view below shows one of the laboratories at Sheffield University with a number of the students at that well-known English institution studying closely the recalescence of steel, or in other words, the minute molecular changes occurring in steel by means of the apparatus shown and which are thermally registered.

So interesting and important is this particular branch of scientific work, that the King of England, who recently visited this University, was particularly impresst with the results obtained. He manifested great pleasure in observing how an elaborate chart of the changes taking place in the steel under heat treatment in an adjacent furnace, could be registered continuously by a form of tape recording machine working in conjunction with the split-second clock shown in the photograph.

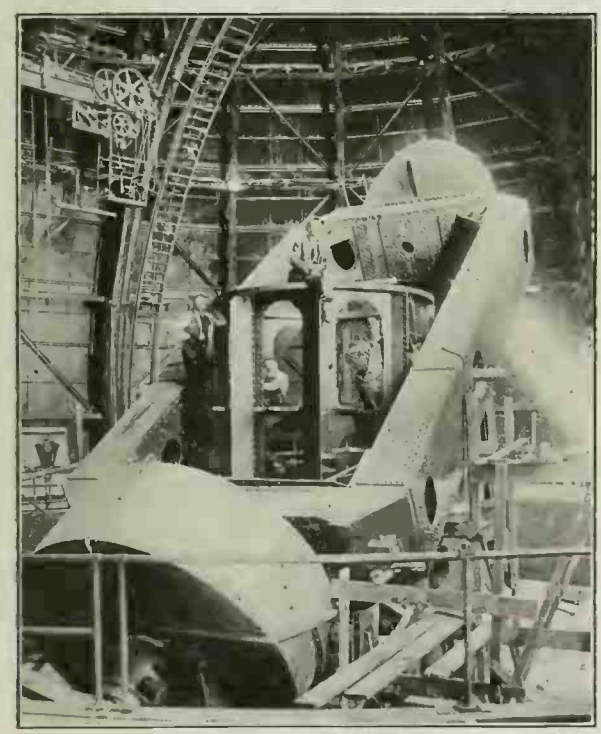
MT. WILSON'S HUNDRED INCH TELESCOPE

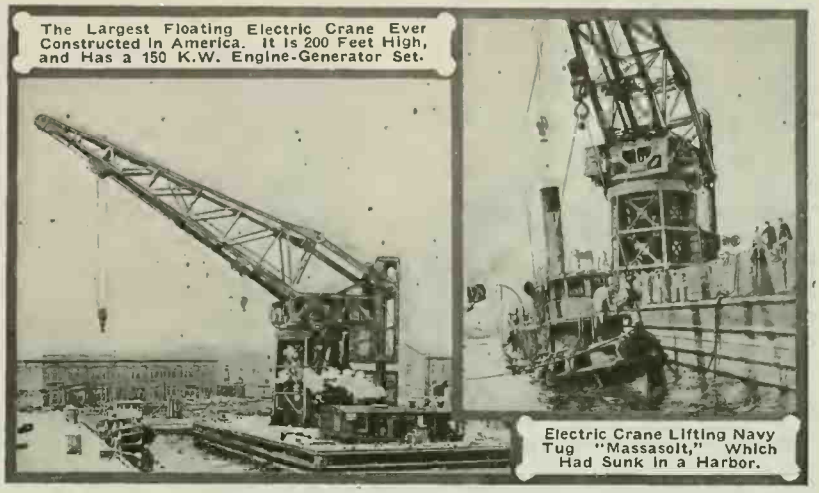


By Professor Walter S. Adams, D. Sc.
Mount Wilson Astronomical Observatory

WITH the introduction into astronomy of the instruments used in the physical laboratory for analyzing light sources and studying their brightness and mode of radiation, the telescope has come to be regarded mainly as an instrument for collecting light. The physicist to a certain extent has the light source at his control, but the light of a star is a fixt quantity, and the only way in which the astronomer can increase the brightness of the image which he desires to examine or to analyze is to increase the aperture of his telescope, say the writer in the bulletin of the *Southern California Academy of Sciences*. One instrument of *twice* the diameter of another will collect *four* times as much light, and, will form an image of a star *four* times as bright, other things being equal. At a period in astronomy when powerful spectroscopes are being employed for studying the motions and the chemical constitution of stars, and when the problem of the structure of the universe requires that we discover and determine the brightness of as many as possible of the faintest stars in the heavens, the value of a great telescope is obvious.

The project of the 100-inch reflecting telescope took form in 1906, when Mr. John D. Hooker provided the funds for the purchase of a suitable disk of glass, the erection of a building for the necessary optical work, and the employment of skilled opticians to figure the surface of the mirror. In the winter of 1908 a disk was received from the St. Gobain Glass Company of France. The mirror was finally completed in the summer of 1916. During that period the work was not strictly continuous, it being necessary occasionally to suspend polishing for considerable intervals on account of unsuitable temperature conditions.

It is not possible here to enter into a



(*Continued on page 755*)

View of Mounting for Mt. Wilson's 100-Inch Reflecting Telescope. The Finished Mirror Weighs 4.5 Tons. The Telescope Is Floated on Mercury. The 600-Ton Dome Rotates Very Smoothly by Electric Motor.

Largest Electric Crane Lifts Complete Tug-boat

THE world is fast beginning to realize that American-made goods are the best to be had, and, also that they are built on integrity, and will not collapse like the German character has

The Largest Floating Electric Crane Ever Constructed In America. It Is 200 Feet High, and Has a 150 K.W. Engine-Generator Set.

Electric Crane Lifting Navy Tug "Massasoit," Which Had Sunk In a Harbor.

and the German Floating Cranes did for the Panama Canal. This "Made in America" crane is said to be the largest ever constructed in this country.

To give a more concrete idea of the amount of work this apparatus can accomplish it may be said that its capacity is equivalent to the weight of 100 of the largest touring cars. The empty lifting hooks weigh about two tons, or the equivalent of a large touring car. When the jib is raised to its maximum height it is over 200 feet above the water level, a height greater than that of an 18-story building. As previously stated, the whole structure is mounted on a flatboat, or floating pontoon, and must not be endangered by handling these immense loads.

The boat contains a complete boiler plant, and an engine driven generator which supplies the electric current for operating the various motions of the crane, which are controlled from a small house mounted high above the deck. By the means of a few levers and master controllers one operator is able to control all the functions with the utmost delicacy.

The speed can always be controlled by the means of the electrical mechanism of the crane. When heavy loads are lowered, the motors are turned into generators and thus the speed is controlled with great accuracy. In the case of an accidental interruption of electric current, all of the crane's motions are automatically locked by means of brakes, and so ensures the impossibility of dropping the load. Safety and accuracy are essential, as the crane is used to handle large guns and turrets on battleships, and if thru carelessness or inaccuracy these should be damaged, it would mean a loss of hundreds of thousands of dollars.

One of the illustrations shows the first work which the crane did. The navy tug *Massasoit* was suddenly sunk in one of the harbors. After divers had past the necessary cables under the tug, the crane rapidly and quickly lifted it to the surface, as shown.

The following data will give a good idea of the enormous size of this machine. Size of pontoon 140 feet long by 85 feet wide by 15 feet deep; size of engine generator set, 150 kw.; the crane has a main hoist consisting of two hooks of 75 tons, each fixt on the jib; an auxiliary hoist of 25 tons capacity movable up and down on the boom; the crane rotates in a *complete* circle, the rotating being controlled by two 60-h.p. motors; the boom luffs up and down from a practically vertical position to an agle of about 30 degrees from the horizontal in its lowest position; the luffing is accomplisht by two 10-inch screws operated by two 60-h.p. motors; the main hoists can operate separately or simultaneously, as desired; when lifting the maximum load it is operated by two 60-h.p. electric motors; the auxiliary hoist has separate motors for hoisting and trolleying, each of which is 60-h.p. The counter-balance at the rear end of the crane is fixt and amounts to 600,000 pounds; the total weight of the pontoon crane (displacement) is 5,000,000 pounds; the capstans are electrically driven, four in number, one at each corner of the pontoon; the anchor hoists are steam driven, two in number, one at each end. The main pivotal bearing, or step bearing supports a ball or universal joint and carries a maximum load of 2,021,000 pounds; the speed of the main hoist under maximum load is about 6 feet per minute; the speed of the auxiliary hoist is 30 feet per minute; the speed of the rotation is one revolution in four minutes; speed of luffing boom, entire range 12 minutes. The boom is of the cantilever type.

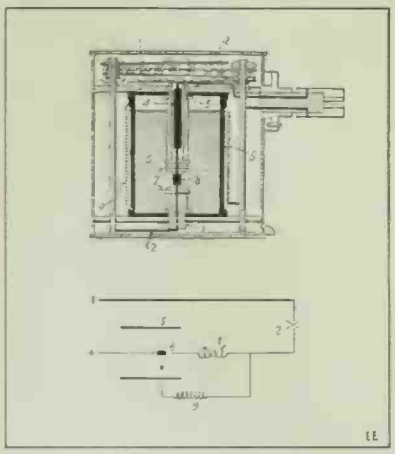
www.americanradiohistory.com



SELLING ELECTRICITY BY THE "CAN."

WE of this generation are quite familiar with the method of supplying kerosene and gasoline by the "can," but who ever heard of *selling electricity by the can?* But such an arrangement promises to come into vogue in Chicago, where the new "metering can" here illustrated has recently been developed and perfected. It has been protected by United States patents issued to Mr. E. O. Sweitzer, of Chicago, Ill., and the various details have been practically all worked out, including the design of the metering element for direct current as well as alternating current service. Owing to the abnormal conditions resulting from the great war, it was not deemed advisable to try to put this device so far on the general market, but now that peace conditions are with us, the concern who has developed this remarkably simple device are getting ready to place it on the general market. This "metering can," as it may be called, is intended to take the place of the conventional watt-hour meter, or kilowatt-hour meter, especially for small current consumers, where it is firstly—quite expensive to install a watt-hour meter, and secondly, — considerable expense is incurred on the part of the operating company, by having these meters read by professional meter-readers every month.

"Electricity by the Can." It Will Do Away with Thousands of Expensive Watt-Hour Meters. It Operates by Electrolysis, the Current, After a Certain Number of Hours, Eating Away the Conducting Member and Opening the Circuit.

When these metering units have become available, all Mr. Householder will have to do will be to go to the electric light company or their agents, and purchase several of these cans. These he takes home and uses one at a time as necessary. The apparatus works on the electrolytic principle, a certain amount of metal being acted upon by the passage of the current thru it, and after a certain number of hours the metal will have been sufficiently eaten away to open the circuit.

Section and Diagram of "Metering Can": 1. Series Resistance. 2. Copper Leads Forming Part of Main Circuit, and Making Connections with the Anode. 3. Protecting Tubes of Hard Rubber. 4. Solid Copper Cylinder Forming Part of Main Circuit, and Connected to Copper Lead at Its Upper Terminal by Means of Special Solder Which Melts at 60 Degrees. 5. Copper Cylinder. 6. Copper Sulfate Solution. 7. Rubber Washers. 8. Copper Anode. 9. Shunt Resistance.

The measurement of current depends upon the electrolytic action of a small copper cylinder of known weight, this being gradually disintegrated by electrolytic action during such time as the current may be used to light lamps or operate motors, etc., but is unaffected during the time when no current is being used. The electrolyte used either for D. C. or A. C. is a saturated solution of copper sulfate. These metering cans are arranged to give a warning signal so that the householder will know ahead of time when he should replace one of the units with a new one. The accompanying photographs show how the metering can is plugged into a wall receptacle in a very simple manner. The meter can here illustrated is so constructed and enclosed in a metal case, as to remove all chances of tampering with it or derangement by accident.

As aforementioned, the can is provided with a projecting contact arm which is inserted in the keyhole of a switch box. It is then given a slight twist to engage the contact with the spring clips of the main circuit and left there until the predetermined amount of current has been consumed. Truly it may be said that this device will mark a new era in electric service to the public.

NEW ELECTRIC FURNACE REGULATOR.

The device is installed easily, and when once in operation relieves the householder of all of his cares in relation to the furnace except the merely mechanical process of "putting on coal." The time clock arrangement makes it possible to maintain a low temperature during the night, and at the time set in the morning, opens the drafts and increases the temperature to the point desired.

This device consists of a thermostat with a clock attachment which operates a motor in the basement, which, in turn, regulates the drafts and dampers of the furnace. Two types are provided, one for use in houses already wired for electricity, and the other in which two dry batteries supply the impulse from the thermostat to the motor box, and a spring motor operates the drafts and dampers.

In the type used in houses already wired the alternating current motor is connected to the alternating main house wires. A transformer on the bottom of the motor box steps the 110 volts down to 6 volts, for use on the thermostat circuit. Thus the dry batteries are dispensed with.

The diagram shows clearly how the regulator works. The thermostat may be set at the heat desired and it will keep the room in which it is installed at that temperature, because if the temperature falls the motor in the cellar will operate sufficiently to open the drafts and increase the heat. The reverse is true when the temperature rises. The thermostat should be installed in a room as near the center of the house as possible and should not be in such a position that its action is subject to the effects of drafts from doors and windows opened for only a moment. — (*Photo courtesy W. E. Co.*

Automatic Electric Regulator Which Tends the Furnace Drafts for You. It Comprises a Thermostat, Clock, Motor and Battery or Other Sources Of Current.

AMONG the hundreds of new devices and appliances publisht monthly in the Electrical Experimenter, there are several as a rule, which interest you. Full information on these subjects, as well as the name of the manufacturer, will be gladly furnisht to you, free of charge, by addressing our Technical Information Bureau.

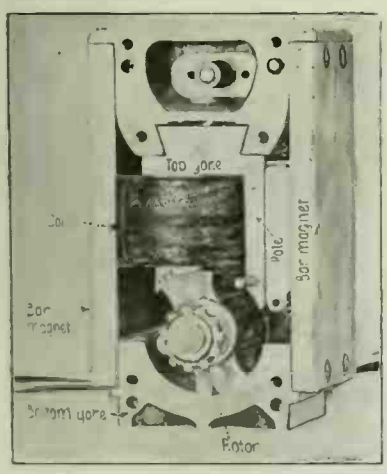
AN ILLUMINATED SERVICE FLAG FOR HOME AND STORE WINDOWS.

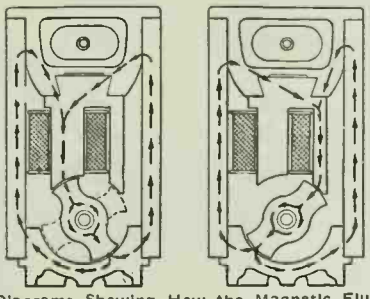
An enterprising electrical concern of Milwaukee is now offering the device shown in the accompanying illustration, known as the



A Handsome Window Decoration in the Form of an Electric-lighted Service Flag.

"Honorlite," which is made in a form to take the place of a military service flag. The device consists of a handsome indestructible wood pulp pedestal with two modelled eagles holding a flat alabaster globe, which is 8 inches in diameter. A 3- by 5-inch service flag is shown on one face of the ball, while five blue stars are furnished loose and can be attached to the circumference or face of the ball as desired. This decorative device stands 12 inches high by 6¼ inches wide at the base, and is wired with 6 feet of cord and plug. It is pointed out by the maker that this device is one which can be used for other purposes, such as special advertising and as a special window display.

A NEW "INDUCTOR" TYPE MAGNETO FOR AUTOS.



This new auto and motor-boat ignition magneto is of the *inductor* type, which means that the coils in which the current is induced are stationary, and the revolving part or rotor consists merely of a block of laminated steel. Instead of horseshoe

View of Interior of New "Inductor" Type Ignition Magneto. The Rotor Is Simply a Moving Iron Member—No Rotating Coils or Collecting Rings.

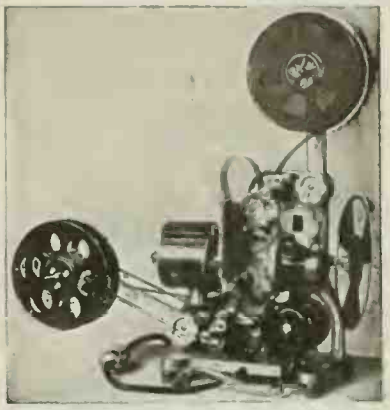
magnets, as always used in the conventional type of magneto, this magneto employs straight bar magnets, which are accurately ground and securely clamped to top and bottom yokes. The bottom yoke forms a pole piece extending nearly half way around the rotor tunnel, while the top yoke has two poles, one carrying the windings or coils, and the other serving as a magnetic by-pass. The magnetic circuit is shown diagrammatically in the two accompanying sketches. In one the rotor pole is shown opposite the pole of a top yoke which carries the windings or coils, and with the rotor in this position, the maximum flux passes thru the coils. In the other sketch the rotor is shown opposite the end of the magnetic by-pass, and in this position all of the magnetic flux passes thru the by-pass and none thru the coils. As the rotor has two poles, the flux thru the coils passes thru a maximum and a minimum twice during every revolution of the rotor.

As all coils and current carrying parts are stationary, there are no slip rings or brushes, except the brush in the distributor. The distributor gears, of bronze and steel, are of ample dimensions, and in connection with the rotating member of the current distributor, are carried in steel and bronze bearings, the sleeve of which is cast integral with the front die casting. The base and top yokes are made of gray iron, and are tied to the die-cast end plates by screws. They are located in place by dowel pins. The field structure is bored and ground as a unit, thus insuring thoroly accurate alignment of bearings and pole-faces. The stationary coil, condenser and laminated pole piece are assembled as a

Diagrams Showing How the Magnetic Flux In the "Inductor" Magneto Is Sent Thru the "Coil" Pole and Then By-past Thru a "Shunting" Pole.

unit and mounted integral with the top yoke.

This new inductor magneto gives two sparks per revolution. The spark characteristics are said to be such as to insure very effective ignition, the current rising suddenly to substantially its maximum value at the beginning, and being well sustained. One feathure that distinguishes the spark obtained from this type of magneto compared to that obtained from other magnetos, is that it passes thru the gap of the spark plugs always in the same direction. That is to say, the same part of the spark plug is always positive.



AN ELECTRIC "MOVIE" MACHINE FOR THE PARLOR.

A new type of moving picture machine for commercial, educational and home use has just been brought out by a New York concern.

Its special features are electric motor drive, by a motor that can be used on both direct and alternating currents; high illumination, and a feed mechanism that gives practically perfect results.

Motor drive was used on the older types, but it was necessary to have separate motors for the different kinds of current, and this naturally limited the use of the motor-driven machines. The new motor used here, however, operates at practically the same speed with either kind of current. Hence this machine can be used wherever there is electric light.

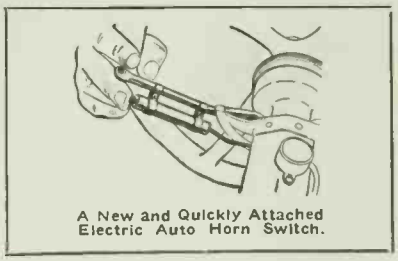
The illumination is provided by a 14-volt, 2-ampere, argon-filled, high efficiency light, that is sufficiently brilliant for throws as long as 100 feet, and for pictures up to 12 feet wide. The 110-volt current received

You Have Often Wisht for a Small "Movie" Machine for the Parlor—Here It is. Its Universal Motor Operates on Alternating or Direct Current.

from the lighting circuit is reduced to low voltage for the use of the lamp, by means of a rheostat; this rheostat is adjustable, so that the degree of illumination can be varied to suit conditions.

The film-moving mechanism is of the intermittent type and is of a novel design. The manufacturers claim that this projector projects an absolutely flickerless picture.

This machine is safe to use since it can take only slow-burning films, the standard celluloid film being unusable in it. Many hundreds of these special films have already been made up; special subjects can be made up as desired, and standard films can be copied on to the special stock.



The weight of the machine is 23 pounds and it is arranged for packing in a carrying case similar to a small dress suit case.

India has increased its annual coal production to 12,000,000 tons and is introducing electrical machinery into some mines.

An electric alarm clock which awakens deaf sleepers by jarring their beds has been invented in Germany. They need it.

A NEW ELECTRIC HORN SWITCH.

Something new in the way of an electric horn switch or push button, for Ford cars, has been recently put on the market. It is attached to the throttle lever by means of two small clamps, and therefore is always within reach of the hand without an extra movement.

A New and Quickly Attached Electric Auto Horn Switch.

The device is a tube-shaped cylinder about ½ inch in diameter and 3 inches long, which contains contact point and wiring, which are cemented in place to insure durability and safety from dampness. The connection is made to the regular equipment by cutting in on the main wiring on the post.

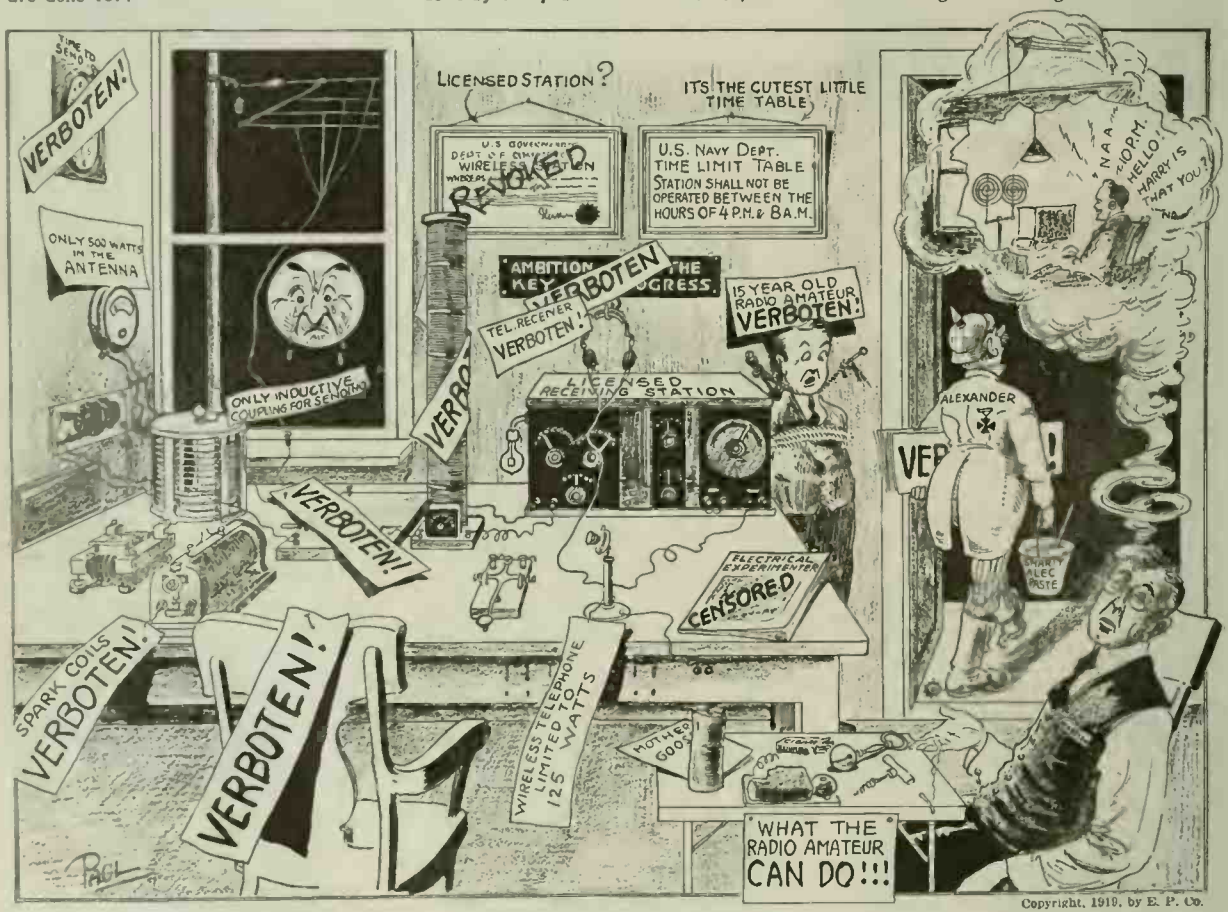
Amateurs Win Questionable Victory



By H. GERNSBACK

PYRRHUS, when congratulated by his friends on the occasion of his victory over the Romans under Fabricius—but which cost a terrible slaughter of his own men, threw up his hands and exclaimed:

"Yes, but one more such victory, and we are done for!"

attempted any nation wide movement to secure the defeat of the bill in question, save and only the ELECTRICAL EXPERIMENTER. Altho several companies manufacturing radio instruments sent out a few thousand letters, no concentrated effort was made to appraise the entire radio fraternity as was done by this publication. About 50,000 letters were mailed out to all radio amateurs interested, and the response we know has been nothing short of wonderful. The writer was in receipt of thousands of letters from amateurs, who in turn in concert with their friends had protested vigorously to Washington, with the result that the amendment printed elsewhere in this issue came about.

The surprising thing however was that none of the other technical publications—there were only two of them commenting about the bill at all—had the situation right in hand. One publication which professes to have the interests of the amateur at heart did not even know that there was such a thing as the Padgett bill! Not one line was printed about it, and the whole situation was therefore more or less mishandled, as all the facts had not been stated clearly, if at all, as they were in the January issue of the ELECTRICAL EXPERIMENTER.

Copyright, 1919, by E. P. Co.

You Are Wrong. This Is Not In Darkest Prussia Where Everything Is Verboten (Forbidden). It Merely Represents An American Amateur Station A. D. 1919 When the Alexander Amendment Becomes a Law.

This was precisely the writer's thoughts when he read the amendments to the Alexander Bill, which has been under discussion for over a month, and which was discust at length in our January issue. After the original Alexander bill H. R. 13159 had been rushed into life, there were immediately regrets by its framers, greatly accentuated by thousands of letters of protest which came pouring in upon Mr. Alexander's committee.

Without wishing to take the credit for everything, it must be stated here that no publication, no radio club, or organization

Not only that, but the press was also appealed to as well, and many papers publisht comments and exprest themselves in no uncertain language about the drastic and entirely unjustified measure known under the title of H.R. 13159.

We wish to repeat here that if any change is to be made, we stand for the Padgett bill. It gives the amateurs exactly the same privileges as he had before the war, and this, we know, is just what the amateurs want.

Now that the situation has cleared somewhat, we are not justified in saying that we think the amateur will be suppresst entirely, for we know that he will not. As a

www.americanradiohistory.com

matter of fact, as things stand today we are not at all excited even about the amendment of the Alexander bill, for we have good and sufficient reasons to believe that the Alexander bill amended has little chance of becoming a law

There is no occasion or necessity for such a drastic measure at the present time. It is not justified, and if we take the propaganda which has been carried on for the last month in Washington, the thousands of protest letters sent to Senators and Representatives, as a fair indication as to how the wind blows, we think we are correct in saying that the temper of the statesmen in Washington today is not such as would support legislation of this kind at this time.

We might write volumes why amateurs should not be suppress, but we believe that official Washington today understands the situation fully. They know by this time what service the amateurs have rendered their country, and how many thousands of expert operators were recruited into the Army and Navy at the outset of the war. Congress will surely not blot the amateurs out of existence in recognition of their work, particularly when there has not been advanced one single, solitary, good reason why the amateur should not be allowed to pursue his innocent endeavor.

America, the greatest democratic country in the world, the one that cherishes the highest ideals of any nation, is not going to start in at this late date to take away the liberties of hundreds of thousands of loyal citizens who have already proved their worth, and will do so again.

In printing the amendment of the Alexander bill below, we call particular attention to paragraph 13. This constitutes nothing but a joker, for if the bill below became a law, and if the Navy Department was in power, it could very readily and without any trouble whatsoever prohibit the sending of messages, let us say, between the hours of 5 P.M. to 1 A.M. This, in the language of the bill, would be "definite periods of the night or day."

If we must have a law, let us have a law without "ifs" and "buts". Paragraph 13 is entirely too elastic in favor of the Government and would inevitably result in shutting the amateurs out at the slightest pretext.

There are certain things in the amendment which are undoubtedly satisfactory to everyone, but as a whole, we are not in favor of the measure. It is too autocratic, particularly the clause whereby it would be necessary for amateurs who had *receiving apparatus only* to secure licenses. Not one in a hundred would wish to go to the trouble of obtaining a license for very obvious reasons. It has been found in the past, that wherever an amateur had to obtain a *sending license*, it was done most reluctantly, and it was the cause of keeping thousands of amateurs away from wireless. It would work even more disastrously if every receiving station were to be licensed. Most of the jewelers—who receive time by wireless—and many young men would prefer not to operate their receiving stations for the word, "Government License", to many simple folk means a big undertaking, and in many cases when a young man finds out that he must obtain a Government license in order to have his wireless set, he prefers to be without it.

What good is it anyway to license a receiving wireless station? If a record of amateur stations is wanted in Washington why not let us insert a clause in the bill which would make it compulsory for every manufacturer or seller of radio apparatus to give a list of the amateurs buying such instruments, which to all intents and purposes would be the same thing as licensing and thus frightening the amateur. This system was in vogue during the war where it became necessary for all manufacturers to supply a list of radio sales to the Navy Department.

No manufacturer would object to this, we are certain, and as the government would then have the list of names it would work out the same way without discouraging thousands of amateurs.

The Alexander bill, amended, follows with our comments in parallel columns:

Alexander Wireless Bill—Amended

65TH CONGRESS, 3D SESSION, H. R. 13159.

IN THE SENATE OF THE UNITED STATES, DECEMBER 11, 1918.

Referred to the Committee on Commerce and ordered to be printed.

AMENDMENTS.

Intended to be proposed by Mr. Watson to the bill (H. R. 13159) to further regulate radio communication, viz:

On page 2, after line 8, add the following:

"The word amateur, or private, station shall be construed to mean any radio station operated by a citizen of the United States for the benefit of himself and science, and which does not do bona fide commercial radio communication."

On page 2, line 14, insert the words "private or amateur" before the words "technical and training school stations."

On page 2, strike out section 3 and in lieu thereof insert the following:

"First. The wave length of private or amateur stations shall be from one hundred and fifty meters to two hundred and twenty-five meters.

This is wholly satisfactory in all respects. It would give the amateurs twenty-five more meters to operate on than he has now. The present wireless law confines the amateur to 200 meters.

"Second. The Government shall have the right to stipulate that the power used by private or amateur stations shall not be greater than five hundred watts as measured in the antenna circuit, except by special license; and shall not be greater than two hundred and fifty watts as measured in the antenna circuit, except by special license, within one hundred and fifty miles of any seacoast, lake front of the Great Lakes, or coast of the Gulf of Mexico.

We can see no fundamental objection against this.

"Third. The Government shall have the right to prevent all persons below the age of fifteen years to use, operate, or own any sending outfit for the sending of radio disturbances into the ether.

We are wholly in accord with this as well. Boys under fifteen years of age in the past have made most of the trouble, and we believe it would be better for the fraternity if boys below this age should start in with a receiving station to obtain proficiency in the radio art.

"Fourth. The Government shall have the right to require all private or amateur station operators of receiving stations to be licensed, and failure to procure a license shall be punishable by a fine not exceeding $600.

Object most strenuously against this unjust measure. There is no necessity for licensing receiving stations only. Our jewelers, thousands of them scattered all over the country must have receiving stations to receive accurate time from Arlington and the like. Not many would want to be licensed under this measure. Secrecy in wireless is impossible anyway. If anyone must receive signals he can do so very readily and easily anyway, law or no law. Important messages are never sent out by the Government or commercial companies unless they are in code. On top of this the present wireless law already has penalties for divulging contents of messages.

"Fifth. The Government shall have the right to require all owners or operators of private or amateur stations to pass an examination whereby the operator of such station shall be able to receive ten words a minute before said operator may be licensed to operate any sending station.

We see no fundamental objection to this, except that it seems rather mysterious to us why an operator should *receive* ten words a minute. What good does the *receiving* do him. Perhaps the framers of the bill meant *"send"* not "receive."

"Sixth. Private or amateur station operators shall not be permitted to operate undamped sending outfits of greater capacity than two hundred and fifty watts as measured in the antenna circuit, except by special license, within the territorial limits of the United States.

This restriction to us seems to be too severe. We should like to see ½ K. W. inserted instead.

(*Continued on page* 735)

Don't fail to read a very interesting discussion appearing on Page 735, entitled "Amateurs Discust Officially" by Lieut. J. S. Cooper, U. S. N. R. F.

www.americanradiohistory.com

President Wilson Always in Touch with Washington—via Radio

FOR several days, going and coming in completing his mission to the European peace conference, it was and will be necessary for the President to administer the affairs of Government from the high seas. Unique as this situation is, hardly less so were the preparations made to enable him to keep in communication with the world during the voyage.

What is considered the most powerful wireless system ever installed on any ship is that carried by the steamship *George Washington*. A corner of the wireless room, fitted with the new radio devices, the latest word in invention and design, is seen in the accompanying picture.

Special arrangements never before used were made for handling President Wilson's wireless messages and to keep him in constant touch with Washington.

This announcement was made by Secretary of the Navy Daniels in connection with a statement that the Navy Department was in continuous communication with the *George Washington* and the flagship *Pennsylvania* on their trip from New York.

Means were at hand whereby he could be brought instantly into communication thru the powerful navy radio station at Annapolis, Md., and Arlington.

Mr. Daniels said:

The *George Washington* and the battleship *Pennsylvania* are both equipt with the most modern radio apparatus, some of which was installed for this particular trip.

"This apparatus includes, on the *Pennsylvania*, the most powerful transmitting set on any United States naval ship and also special receiving apparatus for receiving from high power stations used ordinarily only for transatlantic messages. The *George Washington* was also especially equipt with similar receiving apparatus. On board both ships were installed radio telephones and the newest type of low power sets for use only in communicating from ship to ship. The *George Washington* and the *Pennsylvania* were thus able to communicate with each other and at the same time receive messages from shore.

"All messages for the President were sent by the new naval high power station at Annapolis, which is five times as powerful as the Arlington station. These messages were received by the *George Washington* and the *Pennsylvania* simultaneously. All replies were forwarded from the *George Washington* to the *Pennsylvania* and then instantly relayed to shore by the *Pennsylvania*.

"At three special naval radio receiving stations, one in Maine, one in New Jersey and one in the Navy Building, Washington, expert operators listened continuously for the *Pennsylvania's* messages. The messages when received were forwarded with utmost despatch to the transatlantic radio division of the office of the Director of Naval Communications in the Navy Department, and the three copies were compared to insure accuracy. The messages were then delivered to the addresses. All outgoing messages past thru the same office in Washington.

"As the Presidential party approached Europe, by arrangement of the Navy Department, special receiving stations in both England and France listened for messages from the *Pennsylvania*, and one of the French high power stations forwarded messages direct to the ship. The President was thus kept in touch with Washington and Paris or London simultaneously, for the *George Washington* easily received the messages sent from the Annapolis station until the end of the voyage and the ship was in Brest, France."

The first Cabinet meeting in all history, directed to a certain extent by wireless from mid-ocean, was held in the White House on December 10th, with Vice-President Marshall officiating in the President's absence.

A wireless message from the *George Washington* asked Vice-President Marshall if he would preside and the latter assumed his temporary duty as acting President.

President Wilson was in constant communication with the United States and France during his entire voyage from the United States to France thru the U. S. S. *Pennsylvania's* powerful radio transmitting and receiving sets. The Annapolis high power transmitting station, transmitting on 16,900 meters, the high power transmitting set at New Brunswick, N. J., transmitting on 13,000 meters, the high power transmitting set at Tuckerton, N. J., on 9,200 meters and the high power transmitting radio station in Lyons, France, on 15,500 meters were used for communications to and from the President.

The President on board the U. S. S. *George Washington* was convoyed by the U. S. S. *Pennsylvania* (which is the best equipt ship afloat for signalling purposes in regard to radio communications) and five torpedo boat destroyers. The *Pennsylvania's* radio equipment consisted of the following apparatus: One 30 kilowatt Federal arc transmitter, which was used for transmitting messages to the United States and France on 3,600 meters, one 10 kilowatt Lowenstein spark transmitter, transmitting on 600 and 952 meters, which was used for intermediate communication with low power coastal stations; one short range radio telephone transmitter, transmitting on 297 meters and one vacuum tube short range transmitting set, transmitting on 450 meters, which were used for intercommunication between the U. S. S. *Pennsylvania* and U. S. S. *George Washington*.

The *Pennsylvania* transmitted messages direct to the United States up to a distance of 2,500 miles. Communications with

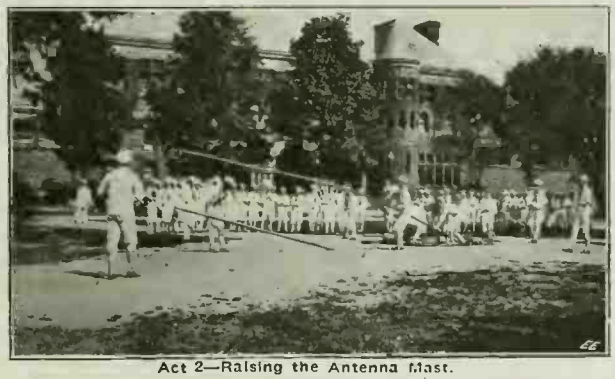
Harvard Naval Radio Men Expert with Portable Sets

THE Harvard Radio School has developed thousands of expert radio operators for the United States Naval Service, and a group of them are here illustrated practising with one of the portable wireless outfits which landing parties use. It is surprising how quickly they can erect an aerial mast and connect the various instrument cabinets together with the dynamo, ready for instant service. It is all a matter of discipline, the commanding officer will tell you. Discipline and system whereby each man does a certain thing, but does it well. That in a nutshell is the whole secret of Uncle Sam's naval efficiency. These men are trained to perform their duties with clock-like precision, and each move in erecting the wireless set here shown is done identically the same each time, which is the only way that real speed can be obtained. Unlike the German system, Uncle Sam's boys are trained not only to do a certain thing in a complex task and to do it well, but they are each and every one of them educated and carefully instructed on all the details governing the operation and functioning of the complete radio outfit. Thus in an emergency any one of these radio men can do anything from tapping the key to erecting the antenna, or dissembling the gasoline engine driving the dynamo, in the event that it fails to work, and ascertain just what the trouble may be. It has been a great task to train all of these thousands of radio operators in the various complex branches of the art, but Uncle Sam's radio instructors, both naval as well as civilian, have proven their worth.

A Radio Squad From the Harvard Naval Radio School Show What They Can Do In Rapidly Setting Up a Portable Type Radio Pack Set. 1st Act—Unpacking the Instruments.

345 MARCONI RADIO STATIONS BOUGHT BY U. S. NAVY DEPARTMENT.



All of the American Marconi radio stations, except the four high power plants, have been bought by the Navy Department, a Washington dispatch of December 5th stated.

At the same time it developed that the department purchased the great Sayville station recently from the Alien Property Custodian along with the Marconi purchases. The American Marconi company relinquishes the field of handling ship to shore messages.

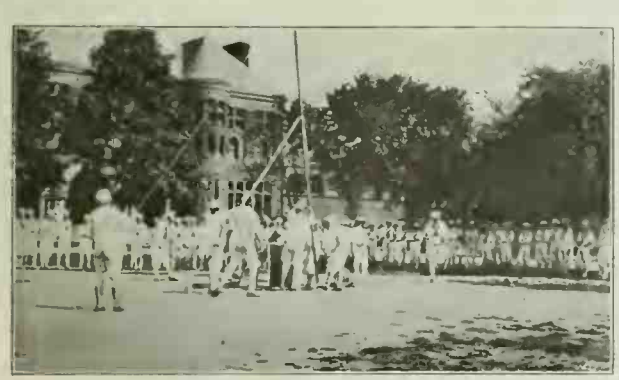
The purchase includes 45 Marconi coastal stations, nineteen of which are situated on the Atlantic and Gulf coasts, sixteen on the Great Lakes, and ten on the Pacific coast.

The four high power units which the company still retains include the Belmar-New Brunswick station in New Jersey, for transmission of messages to England; Chatham-Marion, Massachusetts to Scandinavia; Marshall-Bolinas, California to Hawaii; and Koko Head-Kahukee, Hawaii to Japan. Two units represent each station, each about fifty miles apart, one being utilized for transmission and the other for receiving.

In taking this action the United States is merely following the lead of other nations in controlling the ship to shore business; England took over these stations on her coast 12 years ago, and since that time they have been operated by the Postal Department. The same applies to France, Italy, Germany and countries in South America. Brazil has always operated her coast radio stations.

Act 2—Raising the Antenna Mast.

An official of the company points out that the cream of the business in the future will be the transatlantic message traffic. The ship to shore business has never been a big proposition, for with the exception of a few ships the private business aboard ships or to them has never been large. At the same time development of the transatlantic business is going forward, and when the Government relinquishes control of these big stations, they undoubtedly will produce big results for the company.



The price paid by the Government is not announced at this time altho it has been definitely settled.

The Government has also purchased from the Marconi Wireless Telegraph Company of America wireless apparatus on some 300 ships now under Government control. An announcement to that effect was recently made by Edward J. Nally, vice-president and general manager of the company.

The sale of apparatus to the Government, Mr. Nally said, is "the first result" of a change in the company's policy whereby "it will in the future sell as well as lease wireless apparatus."

A recent London dispatch quotes Godfrey Isaacs as saying that the Marconi Company would outfit airplanes employed in air passenger and mail service with wireless and would supply operators in the same way as it now serves ships. It also is intended to receive regular reports of air conditions in different localities and to circulate these for the information of the pilots. As every airplane will have either a name or distinguishing number, it will be possible to send telegrams from any part of the world or from any ship to an airplane. It is intended that this organization will be ready by the time the peace treaty is signed.

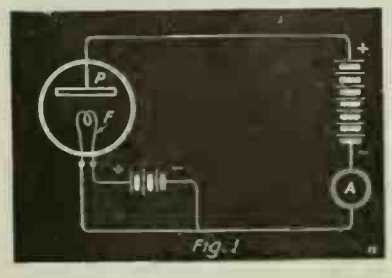
Arrangements recently have been made for the erection of wireless stations in the extreme parts of China, one on the frontier of Cashmere, and another on the Chinese side of Siberia. Mr. Isaacs has arranged with Handley-Page for the transport of the necessary machinery by one or more of his big machines. The journey inland will take two or three days in place of the same number of months.

Act 3—Mast and Aerial Raised and Apparatus Ready For Service.

NAVY MODIFIES RADIO RULES.

Naval conditions in the North Atlantic are such now that restrictions upon commercial radio communications are being removed, according to an official announcement. Personal and commercial traffic with naval vessels as well as with merchant vessels is now permitted west of the 40th meridian.

The restrictions upon land wire telegrams address to naval personnel on board naval vessels, which caused such telegrams to be forwarded thru the Bureau of Navigation, have been removed, and it is now permissible to address personal telegrams direct to men on naval vessels in an American port. Restrictions on amateur wireless stations have not been lifted.



www.americanradiohistory.com

Vacuum Valve Action and the Electric Current

By K. G. ORMISTON, ASSOC., I. R. E.

RADIO INSTRUCTOR, HEALD'S ENGINEERING SCHOOL, SAN FRANCISCO

NEARLY all text-books on physics and electricity state that the direction of the electric current in the external circuit is from the positive terminal of the source of pressure to the negative terminal. The average radio student, from the time he first takes up the study of electricity, is taught that the positive pole of a battery or dynamo is in a state of high pressure and the negative pole in a state of low pressure, and that the

This Diagram Represents a Vacuum Valve Circuit, Minus the Grid Which Does Not Enter Into the Present Discussion. This Article Discusses the Direction of Current Flow Thru the Valve—a Mooted and Foggy Point to the Majority of Radio Men. Does the Current Pass from Filament to Plate Or Vice Versa?

direction of the eletcric current is from positive to negative. This conventional theory is quite satisfactory until the vacuum valve and its action is considered; then the confusion begins.

Figure 1 represents a vacuum tube with the filament heating circuit and plate circuit. (The grid is omitted as it has no bearing on the present discussion.) The positive terminal of the battery B is necessarily connected to the plate P. In studying the action of this circuit the radio student is asked to believe that the current in the plate circuit flows from the positive terminal of the battery B to the negative terminal; that is, from plate to filament within the tube, in spite of the fact that the ELECTRON STREAM IS FROM THE FILAMENT TO THE PLATE.

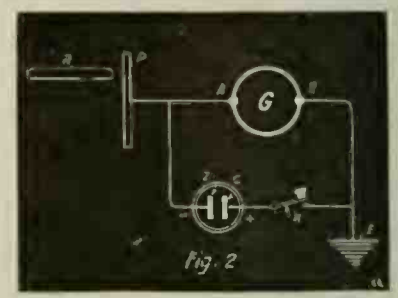
In this connection the leading text-books make the following statements:

1. "Using the ordinary convention for the direction of current flow (which is *opposite* to the direction of flow of the electron stream), we say that a current flows from the plate to the filament."

2. "It will prevent confusion . . . if the student understands that inconformation with the old theory electricity FLOWS IN THE DIRECTION OPPOSITE TO THE FLOW OF THE ELECTRONS."

3. ". . . the number of electrons drawn from F to P per second, that is, conventionally the current from P to F, is found . . . to be roughly proportional to the square of the field intensity."

The instructors in a certain Government Radio School, in their efforts to "conform with convention," even go so far as to teach that positive ions flow from the battery B to the plate P to *neutralize* the negative electrons discharged from the filament to the plate, and thus endeavor to show that a current actually flows from positive to negative. But these instructors fail to explain how positive ions, WHICH ARE ATOMIC IN SIZE, can flow freely thru a copper conductor or a vacuum!



It is my personal experience that much confusion is avoided, and a far better understanding of vacuum valve action, as well as certain other phenomena, is gained if the radio student is taught from the start that the electric current is in reality a flow of negative charges, or electrons, from the negative (high potential) to the positive (low potential) pole of the source of E. M. F.

The above statement concerning the direction of the electric current is not a theory; it is a conclusion drawn from experiment. That the electric current consists of a movement of ELECTRIC CHARGES can readily be shown by the following simple experiment.*

In Figure 2, P is an insulated metal plate. G is a sensitive D'Arsonval galvanometer, connected between the plate and the earth. The simple cell ZC and key K are connected as shown, with the zinc or *negative* terminal of the cell connected to the same side of the galvanometer as the metal plate P. R is a gutta-percha rod, which is held in the hand and may be electrified by rubbing with cat's-fur. The gutta-percha rod when subjected to friction becomes *negatively* charged. When the charged rod is moved near the plate P, the galvanometer will deflect in a certain direction, let us say to the right. The deflection of the galvanometer is caused by an electric current passing thru its windings, and the current must consist of a flow of electric charges. Negative charges may be repelled from the plate by the presence of the negatively charged rod, and flow thru the galvanometer to the earth, or positive charges may be attracted from the earth and flow to the plate. In either case, it is the flow of electric charges which produces the effect of an electric current. As would be expected, when the charged rod is removed the galvanometer deflects in the opposite direction, that is, to the left. The removal of the rod either allows the negative charges which were driven from the plate to the earth, to return to the plate, or releases the excess of positive charges which had been attracted to the plate and they pass off to the earth.

During the first part of the experiment the key K has remained open. Now place a heavy shunt on the galvanometer, so the current from the simple cell cannot damage the instrument. Then close the key K. The galvanometer will deflect TO THE RIGHT. Note that the deflection is in the same direction as when the charged rod was made to approach the plate P, and therefore either *negative* charges are flowing thru the galvanometer from A to B or *positive* charges from B to A. We can now draw this conclusion: The electric current consists of either a stream of negative charges flowing from the negative terminal to the positive terminal, or a stream of positive charges flowing from positive to negative, or possibly both.

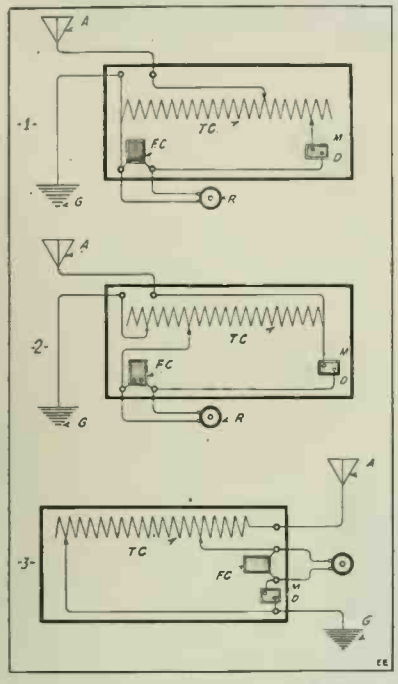
The smallest possible electric charges, both positive and negative, have been isolated in experiments by J. J. Thompson and other scientists, and their mass and velocity are definitely known. The smallest charge is *negative* in sign, that is, it shows the same characteristics as a gutta-percha rod when electrified; is approximately 1/1800th the size of the smallest atom (hydrogen), and is called the "Electron." The smallest *positive* charge is found in the atom which has lost one or more electrons, and is therefore atomic in size. This smallest positive charge, which is but an atom deficient in negative electricity, is called an "Ion."

Experimental Circuit Which Students Are Trained to Learn the Actions of and Which Proves the Audion Explanation Here Set Forth. G Is a Sensitive Galvanometer, Z-C a Simple Battery Cell, K Represents a Key, E the Earth Connection, P a Metal Plate, R a Gutta Percha Rod, Which Can Be Electrified.

It is evident that the positive ion cannot act as a carrier of electricity in a solid medium, or in a vacuum, on account of its size which must be at least as large as the smallest atom. But the electron, bearing the negative charge, can easily pass between the atoms of a solid conductor.

From the experiment of Figure 2, we concluded that the so-called electric current consists of a stream of electric charges, either positive or negative. Thompson's measurements show that the positive charge cannot flow (in the media with which we are dealing); therefore, we may state that the electric current is a movement of electrons (negative charges) from the negative pole of the source of pressure to the positive pole.

For further proof let us again consider the vacuum tube circuit of Figure 1. We have a circuit connected to the battery B, made up of copper conductors and the space F—P, which is devoid of all matter. The ammeter A indicates that an electric current flows in this circuit. Since no ponderable matter exists in the vacuum tube, the only possible carriers of electric charges within the tubes are electrons. The filament F is heated to incandescence in order that ionization will take place, and electrons will be emitted from it. It is necessary, in order to have any current at all in the plate circuit, that the positive pole of the battery B be connected to the plate P, so that the negative charges (electrons) will be attracted to the plate rather than repelled from it. With the arrangement of Figure 1 there will be a stream of electrons or negative charges flowing from F to P within the tube, and it follows that the current in the plate circuit indicated by ammeter A must consist of a *movement of electrons from the NEGATIVE pole of battery B to the POSITIVE pole.*



Let us not be hampered by "convention" and "old theories," but endeavor to seek the Truth. Then Progress will be assured.

* All students in elementary electricity at the Los Angeles Polytechnic High School are required to perform this experiment. See "Elementary Electricity," by Prof. H. LaV Twining.

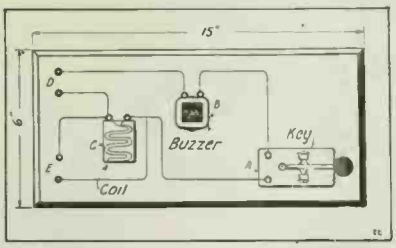
EFFICIENT GALENA DETECTOR.

Everyone is sure to have a small piece of brass rod for which he can find no use. The hard rubber top to an ink bottle in connection with a brass cap from an old dry cell forms a cup. A garage will give you all the slightly worn ball bearings you can use and you need but two. If you have never broken a ruler with a brass strip in it you are a wonder. A few screws, a nut, a couple of binding posts and a piece of board or fiber and you have the makings of a good detector. The accompanying illustration tells the rest. Once you have the tension screw, all you do is hook her up



A Real "Ball-Bearing" Detector—"Radio-bugs." The Cup Swivels Nicely, While the Cat-Whisker Arm Is Balanced—a Design In Great Favor by Experts.

and with a second's adjustment (which won't knock out) in come the signals fine and clear.

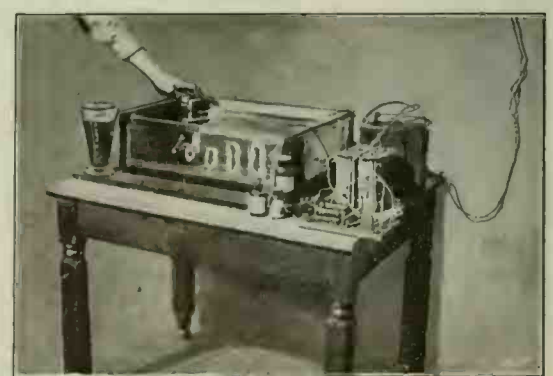
The Vortex Ring Theory of the Electron

By F. W. RUSSELL and J. L. CLIFFORD

THE discussion of the various theories of matter is one of the most important problems that confront the scientist today. Chemistry, Physics, and nearly all branches of science hinge upon this question. The atomic theory has been thoroly establisht, but the ultimate structure of the atoms is still an open question. The leading theories of today make use of smaller particles called electrons to form their hypothetical atoms. These particles were first discovered by Crookes, and about 1897 were definitely proved by Weichert, and Sir J. J. Thomson, to be negatively charged particles traveling with the enormous velocity of nearly 100,000 miles per second. In addition it was found that these particles had an extremely small mass. In fact about one eighteen-hundredth the mass of an hydrogen atom, the smallest known atom. The presence of these particles was again proved by the disintegration of Radium, and even an electric current is now believed to be a flow of these electrons. The electron then is one of the most important entities in the world today, and yet there are very few theories as to the nature of the electron. The physicist has side-stept the problem in the past by simply calling it a hard negatively charged corpuscle, but what a hard corpuscle is, is left to the reader's imagination to picture. Lately, however, the new school of French physicists have brought forward the theory which seems most complete and astounding. They claim that the electron is nothing more or less than a minute whorl in the ether, or as we shall call it an ether vortex ring.



When Lord Kelvin brought forward about 1870 his famous vortex ring theory of the atom, the scientific world hailed with delight this tangible explanation of the structure of the atom. Upon the discovery of the electron, however, the vortex atom theory was thrown into the background and into obscurity. Since the new theory of the electron has been proposed, however, it is interesting to repeat and discuss the experiments with smoke and liquid rings performed by the experimenters wishing to prove the vortex atom theory.

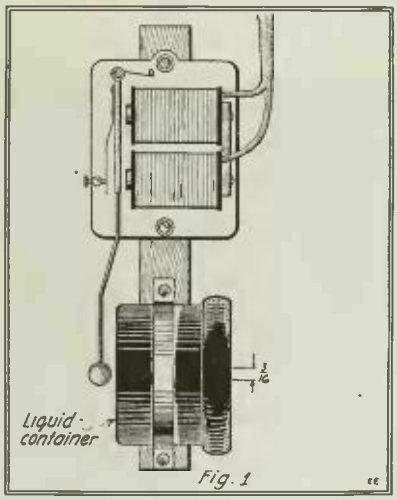
The simplest form of apparatus needed to produce rings of smoke is a round cardboard box with a small aperture in one end. If the box is filled with smoke or with fumes of Ammonium Chlorid formed by the action of Ammonia and Hydrochloric Acid, and the opposite end tapt sharply, rings of smoke will be projected from the box and will hold their shape for some time. The rings move swiftly forward, carrying with them the same material with which they issued from the box, and seemingly possess elasticity of form. Altho many interesting phenomena may be observed using this simple form of apparatus, for accurate and detailed experiment the liquid ring apparatus, described below, will be found the more practicable.

A Most Beautiful Laboratory Experiment Is that of the "Vortex Ring". With the Simply Constructed Apparatus Here Illustrated Vortex Rings of Various Sizes and Kinds Can Be Set Up At Will, By Means of the Red Liquid "Gun" At the Left of the Tank. Various Colors of Rings Can Be Made with Different Solutions. The "Gun" Is Actuated By an Electric Bell Movement, Minus the Gong.

The first requisite is a glass tank at least 30 inches long by 12 inches wide and high. A gold fish aquarium will answer the purpose, provided it conforms to the dimensions. If an aquarium is not available, a tank may be easily constructed by making a box with the base of wood and the sides of glass plates. This box should be well coated with asphaltum in order to make it water tight. When the experimenter has provided himself with a suitable tank, the next problem which confronts him is the construction of the "gun" or projector with which to generate the vortex rings. An efficient gun may be easily manufactured from odds and ends to be found in any experimenter's laboratory. As may be seen in the drawing, Fig. 1, the two principal parts of the gun are the liquid container and the electric agitator. At one end of the liquid container, which consists of a round tin box, is fastened a diafram of Phosphor-Bronze sheet or other flexible substance. In the opposite end, which may be the cover to the box, a small hole about $^{3}/_{16}$ of an inch is cut, care being taken that the sides of the hole are smooth in order to insure perfectly formed rings.

Here We See the Actual Vortex Ring Apparatus Set Up In the Authors' Laboratory.

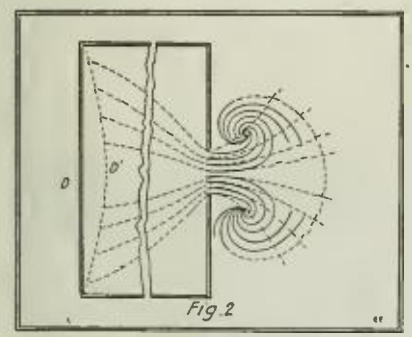
www.americanradiohistory.com



The box should be made water tight. As may be seen in the drawing the agitator consists of a strong electric bell with the gong removed, and the leads taken directly from the coils. The bell should be well impregnated in paraffine or other insulating compound so that it may be submerged without danger of short circuit. The bell should be so placed that the striker will strike the center of the diafram a forceful blow when the magnets are energized. The best position for the striker can only be determined by actual experiment.

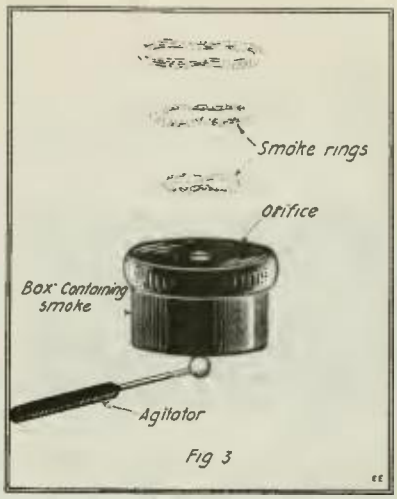
When the projector has been completed, if the experimenter wishes to use red colored rings, the liquid container should be filled with a solution of Sodium Hydroxid, and Phenolphthalein. Be sure that all the air has been expelled, as any air in the container causes the rings to be irregular. The gun is then lowered into the tank, and the magnets energized by means of batteries, controlled by a telegraph key. Rings will be seen to issue from the aperture, and traverse the length of the tank intact. If the water is slightly acidulated with Sulfuric Acid the rings will immediately disappear upon breaking up. If the experimenter wishes to make milk-white rings, an emulsion of Silver Chlorid can be used that will become colorless in a weak solution of Ammonia. To make such an emulsion a tablespoonfull of gelatin should be dissolved in about a liter of hot water. About 15 grams of Silver Nitrat previously dissolved in water should be added. Then stirring well, add a weak solution of Hydrochloric Acid until the Nitrat is all precipitated as a chlorid. This milk-white solution should be diluted with equal parts of water before using. Rings of this solution shot out into a weak solution of Ammonia, will hold their form until broken, and will then completely disappear. The amount of current necessary for each gun can only be determined by practice, and the nature of the rings wished. After some practice, the key can be so manipulated as to produce swiftly, or slowly moving rings. Two guns should be constructed, as it is necessary in some experiments to connect them in series, and shoot rings towards each other. The guns should be so arranged on handles that it is possible to shoot rings from all angles under the water. When the guns have been adjusted and the tank filled, the experimenter is ready to begin his experiments.

The kinetic energy of these rings is considerable, as shown by several rather interesting experiments. If a light watch chain be suspended in the path of a ring it will be noticeably deflected by the impact of the ring striking it, altho the ring itself is broken. If a piece of light tissue paper is tightly stretched on a frame, and held in the path of the rings, the rings will break thru the paper, but in turn are broken up by the impact. A pretty experiment is to similarly stretch a piece of chiffon cloth and hold it before the gun. *The rings will pass thru it without being broken or disturbed in their motion.*



If two guns are placed opposite each other, and rings be projected simultaneously, it will be observed that if they strike each other fairly, both will be broken up. If, however, their path is such that they would merely have touched on their edges, they will bend out of their course and will pass each other without injury. This phenomenon of the mutual repulsion of the rings is in accordance with the modern idea of the electron; namely, that they are like charges of electricity, which repel each other. These vortex rings, of course, are not supposed themselves to have any electric charge, tho acting like an electron; they are simply clever illustrations of *what an electron is supposed to be.*

If a ring is shot towards the surface of the water in the tank, it will be noticed that at certain angles, it is reflected from the surface and *continues in a new path* the same as the angle of incidence. At other angles the ring will not be reflected but will jump out of the water with a spurt. Besides being reflected it can be shown that these vortex rings can be refracted. The tank should be half filled with water, and a dense solution of Sodium Chlorid siphoned into the bottom of the tank, so as to make a layer of denser liquid underneath the water. If a swiftly moving ring be shot so as to pass into the salt solution at an angle it will be noticed that the ring will pursue a slightly downward course, curving slightly.



One Way of Making the Liquid "Gun" for Shooting Vortex Rings Thru Water as Shown in the Illustrations On Opposite Page.

There are many more experiments in this line, which space does not permit us to enumerate. We will, however, name a few extremely interesting experiments. The aperture can be cut in all manner of forms, thereby imparting to the ring various vibratory movements, or two holes can be cut near each other, thus projecting two rings at the same moment. Rings can also be shot into a lighter layer of oil, which is poured over the surface of the water, and interesting results may be obtained. If it is desired to procure actual models of the rings, the gun should be filled with melted paraffine, and the ring shot from a layer of hot water into a layer of cold water beneath. *The rings will harden upon coming into the cold water, and may thus be saved.*

The Formation of the Vortex Rings. When the Diafram is Moved from D to D', the Stream Lines of the Liquid Outside the Aperture Will Be Somewhat as is Indicated By the Full Lines. The Liquid Bends Into Spirals, Each Particle Moving Towards the Place Where the Pressure is Diminishing, and the Ring Formed Continues to Rotate Around a Circular Center.

A word as to the formation of the rings by the gun will doubtless be necessary. Referring to Fig. 2 it will be noticed that when the diafram D is moved from D to D' the stream lines of the liquid outside the aperture will be somewhat as is indicated by the full lines. After the liquid has issued from the aperture it would be expected that the liquid would move as the broken lines indicate. Instead it bends into spirals, each particle moving towards the place where the pressure is diminishing, and the ring formed continues to rotate around a circular center.

The Vortex Ring Smoke "Gun." Every Time the Bottom or Diafram of the Box is Struck, a Smoke Ring Issues from the Small Opening in the Top of the Box.

Water is one of the best mediums for producing vortex rings, because it is incompressible. It has, however, a great viscosity, and internal friction, which prevents their being permanently formed. According to the mathematician, in a perfect fluid, such as ether is supposed to be, a vortex ring could never be created, but if once formed could never be destroyed. Thus an electron, if it were an ether vortex ring, as is surmised, would be indestructible. This accords with the theory of matter as accepted today.

TESTING THE QUALITY OF MILK.

By means of two simple tests it is possible to determine with a reasonable degree of accuracy the quality of milk. A qualitative test to show whether the milk contains water or not is made in the following manner. Take a perfectly clean steel hatpin and immerse it point down into the milk. If on withdrawing it a film of milk covers the same, there is no free water present. On the other hand the presence of water in small quantities will prevent the milk adhering to the pin.

Should the above test show the presence of water the percentage of the same can be obtained in the following manner:—Take an ounce of plaster of Paris and wet it with the milk under test till a smooth paste is formed. Allow the paste to dry, determining the length of time that elapses before it hardens. The percentage of water can then be obtained from the following table:

Time	% Water	Time	% Water
20 min.	75	5 hrs.	12½
30 min.	50	6 hrs.	10
1 hr.	40	7 hrs.	7½
2 hrs.	25	8 hrs.	5
3 hrs.	20	9 hrs.	2½
4 hrs.	15	10 hrs.	0

This test depends on the fact that the cream in the milk retards the hardening.

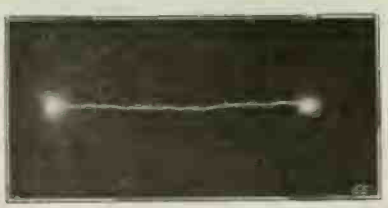
"Ball Lightning" Experiments

By SAMUEL S. WEISIGER, Jr.

IN the January, 1916, issue of the ELECTRICAL EXPERIMENTER you publisht a discourse on "Ball Lightning," and gave instructions for the experimental production of it. Thru the kindness of Mr. Porter, Instructor in Physics at the

This Is Another "Freak" Discharge. The Ball Travelled In a Very Crooked Path to the Positive Electrode, and Here Exploded. The Force of the Explosion Was So Great that a Part of the Spark-Ball Was Thrown to the Other Side of the Positive Electrode, from Whence it Continued to the Positive Electrode.

Allegheny High School, I have been able to make the several photos accompanying this letter. Under each photo there is given a short description of the circumstances under which each discharge was made and the phenomena connected therewith.



In making these photos a 75,000 volt Toepler-Holtz static machine was used. The distance between the sharp metal points was from 5.5 to 6 centimeters. This distance must be found by experiment, and altho it is absolutely essential to have the correct distance between points, it will nevertheless differ with the capacity of the static machine.

Much trouble will be encountered if the sharp points, used to produce the discharge, are not free from grease and highly polished. The best way to polish the points is to take a little powdered chalk (blackboard chalk which has been scraped to a fine powder with a knife) and put it on some kind of cloth and turn the point of the electrode, at the same time giving considerable pressure to the cloth where the point is being turned.

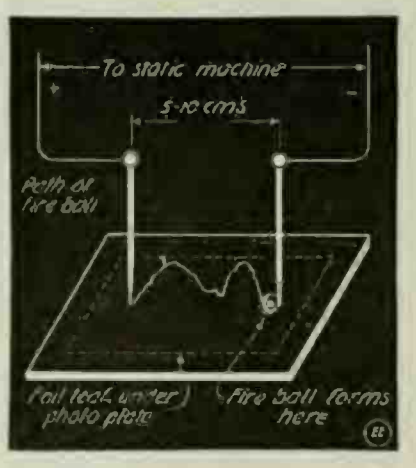
The best connection for the electrodes was found to be obtained by means of two brass chains.

Two large-sized, sharply pointed darning needles suitably mounted form admirable electrodes. It is practically impossible to use blunt needles.

There will be much trouble in finding the correct spacing for the electrodes and it will probably require some experimentation. In any case the spacing is dependent on the power of the static machine.

Some Trouble Was Encountered In Getting this Spark-Ball to Form. Evidence of This Is Shown By the Plate Being Exposed By a Tiny Charge Or Burst of Light On One Side of the Negative Electrode. The Uneven Course of the Spark-Ball Is Clearly Defined.

When the plate is put under the electrodes be sure to get the emulsion side up, as the discharge occurs better when the plate is placed in this manner.



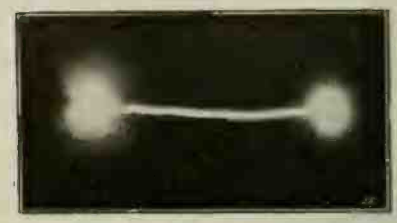
When the plate is under the electrodes and the static machine has been started, the spark ball should form very quickly. After the ball has detached itself from the electrode, turn the machine very slowly in order to expose the plate longer. The rate of travel of the spark ball is proportional to the speed of the static machine.

Should the machine be stopt before the spark ball reaches the other electrode, the plate will only show the path of the ball to that point.

* * * *

Knowing that there is considerable interest in these "Ball Lightning" experiments we have republisht below the original directions for producing ball lightning in the laboratory as outlined by the famous French scientist—M. Stéphane Leduc. His experiment makes possible the production of a slowly moving globular spark not easily obtainable in any other way, in so far as we know.

To produce this imitation ball lightning it is necessary to employ two very fine highly polished metallic points, each of which is in connection with the positive and negative poles, respectively, of a static machine of small or medium size. These



Scheme for Producing Ball Lightning In the Laboratory with Static Machine, Photograph Plate and Two Needles.

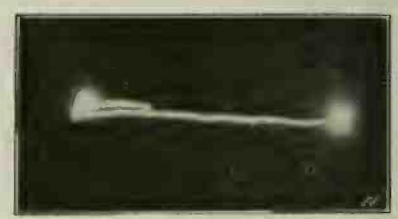
two metallic points must rest perpendicularly, as our illustration indicates, on the sensitive face of a gelatin bromid of silver photographic plate, which is placed on a metallic leaf, such as tinfoil. The two metal points are spaced about five to ten centimeters apart. When the static machine is operated an effluvium is produced around the positive point, while at the negative point there is formed a luminous *fireball* or *globule*.

Now, when this globule has reached a sufficient size, it will be seen to detach itself from the metallic point, which then ceases to be luminous, and the globule will begin to move forward slowly over the surface of the plate, taking various curved paths and eventually it will set off in a direction toward the positive metal point. When it reaches this electrode the effluvium is extinguisht and all luminous phenomena ceases. Further, the static machine acts as if its two poles were short-circuited, or, in other words, united by a conductor.

The velocity acquired by the luminous globule as it travels is quite slight, it taking from one to four minutes for it to traverse a path of six centimeters in some cases, and before reaching the positive electrode the globe bursts into two or more luminous balls which individually continue

This Is Probably the Best Photo of the Set, the Spark-Ball Being the Largest Obtained. You Will Notice the Manner In Which the Ball Broke Into Two Parts and Each Part Proceeded to the Pole. The Effluvium Around the Positive Pole Shows Signs of a Violent Explosion As Will Be Noted By Closely Examining the Tree Formation Made By the Bursting Spark-Ball.

their journey to the positive electrode. On developing the photographic plate (which, of course, should be placed under a ruby light while the foregoing experiment is conducted) there will be found a trace on it of the exact route followed by the spark globule—the point of explosion, the routes resulting from the division, and the effluvium around the positive electrode point. Also, if one should stop the experiment before the globule's arrival at the positive electrode, the photograph will only give the route to that point. The fireball takes for its course the conductor, which apparently short-circuits the static machine. If sulfur or some other powder is thrown on the photographic plate while the experiment is being conducted, and also while the ball is moving, its path will be marked by a line of aigrettes, looking very much like a luminous rosary.



[*The Editors will be glad to hear from any of our readers who have made experiments in this direction. Photographs are particularly welcome.*—ED.]

HORSE-POWER OF WIND MILLS.

Below is given a table showing the actual useful horse-power developed by a windmill working under different conditions.

HORSE-POWER OF WINDMILLS

Diam. of Wheel in Feet	Velocity of Wind, Miles per hour: 8	10	12	16	20	25	30
	Actual useful Horse-Power Developed						
12	0	⅛	¼	½	1	1⅔	2
16	⅛	⅜	¾	1½	2¼	3½	4
20	¾	1¼	2	3	4	5½	7
25	1¼	1¾	3	4½	6	8	10
30	2	3	4	5½	7	9	12

This Is One of the "Freak" Ball Lightning Discharges. The Spark Ball Formed At the Negative Electrode and Travelled Straight for the Positive Pole, But Did Not Reach It. It Disappeared Without Exploding. The Machine Was Kept Going and for Some Unknown Reason Another Ball Formed and Backed Away from the Negative Electrode, and Broke Into Two Pieces Before It Reached The Positive Electrode.

A Useful Electrical Laboratory Switch-board

By H. DANNER

A SWITCH-BOARD is a valuable accessory to any Experimenter's electrical laboratory. The switch-board here described is intended for use on an *alternating current* circuit of 110 volts, 60 cycles frequency. But if the switch-board is to be used on a *direct current* circuit the only changes necessary are the substitution of D. C. instruments and the removal of the low voltage transformer.

The marble or slate panel is 3 ft. 10 in. long, 2 ft. 6 in. wide and 1 or 1¼ in. thick. It is supported by two angle iron uprights, 2 x 2 inches, and 6 ft. 4 in. long, plus four inches which is bent back as a foot as illustrated in Fig. 4. To make this bend saw off one side of the angle four inches from the end and after heating it red bend at right angles by putting it in a vise. Use a hammer to make a square bend. The panel is fastened to the angle irons by six ⅜ inch bolts as shown in Fig. 1. The weight of the marble or slate is supported by a piece of angle iron across the bottom of the switch-board fastened as shown in Fig. 5 (a bolt can be used instead of a rivet). The top of the board is braced to a wall by means of a flat piece of iron bent on one end to permit it being bolted to the wall.

A marble drill should be used in drilling the marble, but an ordinary drill will serve the purpose. Water will help to drill either marble or slate.

We are now ready for the instruments and switches. The voltmeter is preferably a Weston model 151, 0—150 volt scale range. The ammeter is the same model, 0—150 amperes scale range. Both instruments are 9½ inches in diameter. All connections are made at the back, conforming to standard switch-board practise.

The main line cut-out is of 100 amperes capacity and is located between the instruments. The main line switch, 100 amperes, connects the bus-bars to the line. The ammeter is connected in series with the switch (see Fig. 1). The volt-meter is connected to a small, double-pole, double-throw knife switch, one side of which is connected across the main bus-bars and the other side across the step-down transformer outlet.

The upper set of (copper) bus-bars are ⅝" x ⅛" x 24" and are spaced two inches apart. The bars leading from the main line switch to the second set of bus-bars are of the same size. The lower or second set of bus-bars are ½" x 3/64 x 24".

The bus-bars are fastened by No. 8—32 copper or brass machine screws (⅛" in diameter). All connections must be well made. The bars are insulated by bending them up and over the other bars. The switches are connected to the bus-bars by short pieces of copper bars.

The upper row of switches consist of two 60 amp. D.P.S.T. switches placed in the center and two 30 amp. D.P.S.T. switches on each side. All the switches have fuse clips attached of proper capacity.

The four switches in the lower row are 15 amp. D.P.S.T. switches.

Below this row are placed three plug receptacles, two *polarized* and the other unpolarized, located as shown in the drawing. A double-pole double-throw 15 ampere switch is placed in the middle with a small charging rheostat on the right. This switch connects the storage battery to the motor-generator and to the discharge outlet. The plug receptacle on the right is connected directly to the motor-generator and affords a source of direct current. The one to the left of the switch is connected to the storage battery and is of use in many experiments. The plug on the left side is connected to the step-down transformer.

The service to which the individual switches are put depends upon the needs of the experimenter. The two 60-amp. switches are intended for the arc, electric furnace, or for a 5 K.W. step-up transformer and other apparatus requiring over 30 amperes. The switch for the arc is connected to the stage plug at the bottom of the switch-board. A variable resistance is connected in series with the stage plug.

The first switch on the left-hand side, second row, connects the primary of the step-down transformer to the line. The next switch to the right is for a high voltage transformer. Then comes the hand wheel or knob of a small field rheostat for the motor-generator. The field rheostat is mounted behind the board in such a position as not to interfere with the other apparatus. To the right of this comes the motor-generator switch, and on the right is the switch for the lights.

The transformer slide at the lower left-hand side consists of a ¼" square brass rod 14¼" long. Over this rod a ¼" square hollow tube, 1 inch long is fitted, with a handle and spring contact large enough to cover only one contact point at a time. The contacts can be made from ⅜" round brass rod and fastened and connected in the same manner as starting box contacts. Use your judgment in all of this work. There

Experiments in Radio-Activity

By IVAN CRAWFORD

PART II—Ionization (Continued)

IN the first installment the construction of a super-sensitive electroscope was outlined, and the conduction of electricity thru gases partially discust.

Before going further into the mysteries of radio-active phenomena it is fitting that further experiments with this electroscope should be given. Another method

Home-Made Telescope-Electroscope For Use In Studying the Retardation of Alpha Particles By Aluminum.

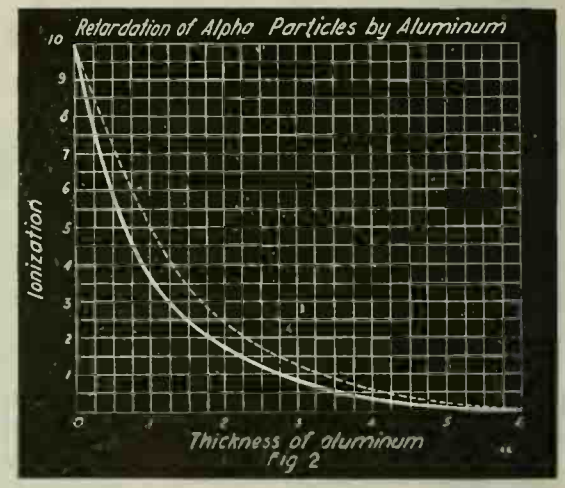
for the detection of *ions* will also be given.

The retardation which an alpha particle experiences in its course thru matter, depends entirely upon the atomic weight of the atoms thru which it passes. Bragg and Kleeman found that the retardation of the alpha particle was approximately proportional to the square root of the atomic weight of the substance. In the case of metals, their weight per unit area, required to completely overcome the alpha radiation, is proportional to the square root of their atomic weight.

It was found that the retardation of the alpha particle by complex molecules was an *additive* property. For, consider that a molecule is composed of N number of atoms of atomic weight W, together with N^1 number of atoms of atomic weight W^1, etc. Then the retardation of the alpha particle is $N\sqrt{W} + N_1\sqrt{W^1} \ldots$.

Sir Ernest Rutherford has determined the specific retardation of alpha rays in metals both by observation and calculation. A few of his results with the commoner metals are given below: s is the observed stopping power of the atoms in terms of air as unity; w is the atomic weight. It will be noticed that the quotient $s/\sqrt{w}$ is approximately equal in all cases.

Metals.	Al.	Fe.	Cu.	Pb.
s	1.495	2.29	2.46	4.27
$\sqrt{w}$	5.2	7.48	7.96	14.35
$s/\sqrt{w} \times 10^3$	287	307	309	298



By a series of simple experiments the reader may determine the retardation of alpha particles by thin sheets of the commoner metals. On a grounded metal disc a quantity of radium bromid is placed. See Fig. 1. Thin sheets of aluminum, brass, copper, iron and lead should then be interposed between this active material and the electroscope. The discharging current should then be measured as outlined in the previous paper. The sheets of the various metals should be of the same thickness to allow comparison. It will be noticed that the experimental results will compare very favorably with the calculated values.

A very interesting experiment is to interpose successively various thicknesses of aluminum between the radium bromid and the electroscope. With the electroscope empty the gold leaf past over five divisions on the scale in 412 seconds. The time with uncovered radium bromid was 15 seconds. Upon placing a sheet of extremely thin aluminum leaf over the ionizing agent the electroscope discharged in 25 sec., showing that a portion of the alpha radiation was stopt by the aluminum leaf. When a sheet of aluminum foil about .001 of an inch thick was interposed, the electroscope was discharged in 137 sec. A sheet of aluminum .01 of an inch thick cuts off the entire radiation, and the ionization caused by beta particles, which easily penetrate this obstacle, is very small, discharging the electroscope in about 380 sec. A sheet of lead cuts off the entire radiation, the electroscope discharging the same as when empty.

To determine the retardation of alpha particles by aluminum the following experiment may be performed. The radium bromid is covered by successive layers of aluminum leaf and the discharging current measured in each instance. For radium the ionization falls off in geometrical progression as the thickness of the aluminum is increased. Thus, as Makower has shown, where I_0 is the intensity of the active substances uncovered, then I is the intensity when a thickness of aluminum, t, is interposed.

$$I = I_0 e^{-\lambda t}$$

Where e is the base of the Naperian logarithms and λ is an absorption constant which has a different value for each substance. It is proportional to s in the preceeding table. This law holds true for homogeneous radiations, but when using ordinary radium bromid as an ionizer, four sets of rays are given off, each having a different penetrating power. Until the thickness of the aluminum is great enough to cut off one set of rays the law given above will hold true. The author has found that about 6 thicknesses of aluminum are sufficient to cut off the first set of radiations. In the accompanying graph Fig. 2, the full line indicates the successive stopping powers up to 6 thicknesses of aluminum leaf for radium as determined by Rutherford. These results were obtained by the author and experiments by the reader should be proportional to these.

Graphic Chart Showing the Effect of Different Thicknesses of Aluminum In the Retardation of Alpha Particles.

That the radiations given off by radio-active materials ionize the air into positively and negatively charged carriers can be readily proven by the following experiment: Connect a spark gap with an induction coil and with a vacuum tube as indicated in Fig. 3. A large Geissler tube will give excellent results, the larger the better. The spark gap should be capable of fine and delicate adjustment. The coil must not give too strong a discharge, but the discharge must be very steady. Arrange matters so that the coil gives a steady discharge at the spark gap and then draw the electrodes apart until the discharge just passes thru the vacuum tube, only an occasional spark crossing the gap. A small quantity of radium bromid is then brought into the vicinity of the spark gap. When this is done the Geissler tube will be partially dimmed and the discharge will pass by way of the spark gap. The greater the amount of radium bromid used the more the tube will be dimmed. This is caused by the ions formed by the radiations from the active radium bromid. If care is taken that the conditions named above are secured the experiment will always be successful.

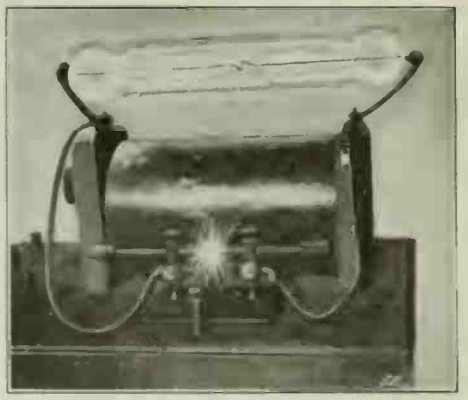


Fig. 3.—A Very Interesting Experiment Can Be Conducted With a Geissler Tube and Spark Gap, Excited By a Spark Coil, In Connection With Some Radium Bromid. The Radium Will Dim the Tube, the Spark In the Gap Becoming Heavier.

(To be continued)

Experimental Mechanics

By SAMUEL D. COHEN

LESSON X

ANOTHER valuable feature that the lathe possesses is the cutting of tapers. Standard tapers are rated at the amount with which the diameter changes in a foot's length. We will take as an instance the standard Brown and Sharp taper, which is one-half inch per foot, and how it is turned in the lathe.

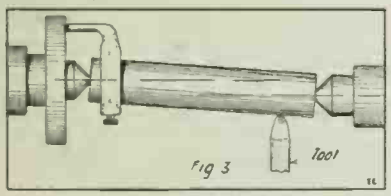
Measuring Off the Required Distance Between the "Live" and Tail-Stock Centers, Preparatory to Turning a Taper in the Lathe.

First, it can be turned by the use of a taper attachment on the saddle of the machine, or else by offsetting the tail-stock from its regular central position to give the required rate of change in the diameter. In all taper attachments the settings are graduated to read direct. Thus it is easy to set the tool for cutting the prescribed taper. The second method of offsetting the tail-stock is not as simple as the first. If the distance of the center points enter the work, or the mandrel is ignored, the mandrel length can be considered as the distance between the central points. In order to determine at what length the centers shall be offset for a given taper, a simple arithmetical calculation will be required. This is done by multiplying the length of the work or mandrel in feet by one-half the required taper in inches. To turn a Brown and Sharp taper on a piece of work nine inches long, the problem would work out in the following manner. This particular calculation refers to the one-half inch taper per foot specified in the opening paragraph of this lesson:

$$\frac{\frac{1}{2}}{2} \times \frac{9}{12} = 0.1875 = \frac{3}{16} \text{ inch.}$$

The value of 3/16 inch would be the required amount necessary to offset the center of the tail-stock. The off-centering is accomplisht by unscrewing the set screw on the base of the tail-stock and shifting it towards the cutting tool 3/16 inches away from its original center-line position. Fig. 1 illustrates the simplicity of accurately figuring the exact position of the respective centers by the use of a steel scale or rule.

It will be noticed that in the above illustrative problem that both the length and amount of taper are given. However, at times it happens that the amount of taper is not given. Let us suppose that a piece eight inches in length is to be turned on one end. The taper portion should be four inches in length. The difference in diameters of this four inch section is to be one-half inch. The problem is, how much must the tail-stock be offset? If the taper is ½ in 4 inches, it would be 1½ inches in a foot or three times as great. and the tail-stock would be moved over one-half of 1½ inches or ¾ inch. This calculation holds good were the piece a foot long, but as it is 8 inches. or ⅔ of a foot, the tail-stock should be moved over ⅔ x ¾, or ½ inch. Should the piece be twenty inches long, the tail-stock would be moved 1⅔ x ¾, or 1¼ inches.



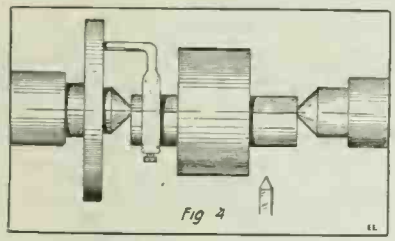


Diagram Showing Plainly How a Piece of Stock Is Placed Between Off-Set Lathe Centers When It Is To Be Turned On a Taper.

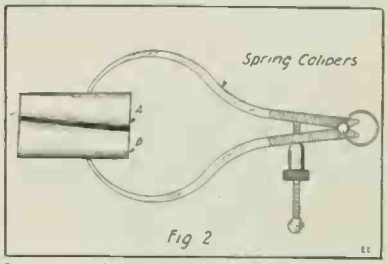
The above problem was assumed for simple calculation, the lathe centers merely touching the ends of the working piece, thus making the length of the piece the same as the distance between the centers. In actual practise the depth of the centers in the work must be considered. The calculation should be as accurate as possible to avoid continually changing the tail-stock in order to get a reasonably good taper fit. The necessity of considering the exact distance between centers depends somewhat upon its length. If the piece is very long the actual taper will differ considerably from the calculated taper. If each center enters the piece ¼ inch they would enter a total of ½ inch. The length of the piece should thus be reduced by ½ inch in the calculation. While turning the taper, the calipers should be used frequently so that it may quickly be determined whether or not the tail-stock is correctly placed for the job in hand.

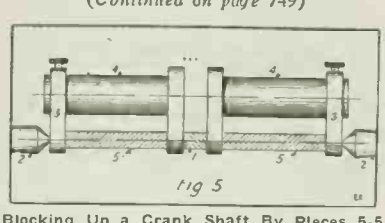


Eccentric Discs For Steam Engines and the Like Are Bothersome Jobs To Turn. This Diagram Shows How An Eccentric Is Readily Centered On An Arbor Having Off-Set Centers.

In order to test the accuracy of the taper as it is turned it should be prest lightly into a standard tapered hole and worked back and forth sufficiently to mark the places where bearings points occur. If the work has been lightly covered with some marking pigment (chalk), the bearing points will be more distinct. However care must be taken that the coating is not too heavy, as it will be liable to deceive the amateur. Adjust the taper setting until a correct fit is obtained.

Another very good method of testing the exactness of the taper is to obtain another taper mandrel or form of standard size, having the same taper pitch. and placing its surface against the one cut, as shown in Fig. 2, where either A or B can be the *standard*. Then set a pair of calipers on one side, and run over the entire surface with the same setting of the calipers. If no indication is shown of surface irregularity the taper is said to be true; if high or low marks are present, the taper is not true and a readjustment of the tail-stock setting is necessary to correct it.

In turning down a taper the centers must be employed. This work must be turned down with the aid of the face plate and dog shown in Fig. 3, which illustrates the position of offset work for taper cutting. A lathe chuck cannot be used for this class of work, as the piece to be turned down is kept rigidly in place in a central position, thus preventing its position from being offset. The chuck is used only when a taper attachment is employed. It should never be used otherwise. At times in cutting a very short taper or conical point and when a compound rest is at hand the compound rest is turned to an angle equal to the angle of the taper to be cut. However it is advisable to adhere to the simple method of cutting a taper and as soon as the novice feels quite safe with this method he will then be at liberty to try those more difficult.



One Method of Testing the Accuracy of a Tapered Piece By Placing It Alongside a Standard Taper, and Running the Calipers Over Them.

The experimenter who is mostly familiar with the use of the lathe for turning concentric objects will now see that the lathe is just as useful in turning objects of eccentric shape. The most common of such objects is the eccentric which operates the valves of a steam engine. If the work has a hole thru it, as in the above example, the hole is first finished to the required dimensions and then a mandrel is used for carrying the work on the lathe centers. While the mandrel has been built on one set of centers exactly true with its axis, for concentric turning, it has a second set of centers which offset the amount required for the eccentricity specified. In the case of eccentrics made solid with the shaft, there are two sets of centers, one for turning the shaft—and the other for stabilizing the opposite end of the shaft. Fig. 4 shows how such an eccentric is arranged in the lathe for proper turning. Note the position of the central axis of the object with respect to the *live* and *dead* centers of the lathe. At certain times the specified eccentricity is too extreme to allow both pairs of centers coming within the limits of the diameter of the shaft. Special ends may be cast, forged (or clamped) on the ends of the work, and can afterward be machined off. In crank-shaft turning, special attachments should be provided for the ends of the shaft, or special chucks for eccentric turning may be made to hold the work.

The turning of crank pins on shafts is

Experimental Chemistry

By ALBERT W. WILSDON

Thirty-third Lesson

ARSENIC: History.

THE ores of Arsenic, in the form of its two sulfids, *Realgar* and *Orpiment*, were known to the Alchemists. Geber was familiar with the oxid, and Mangus refers to the metal; but Brandt, in 1773, first showed that white arsenic was obtained by burning the metal.

Dialyzer Used For Separation of Arsenic Prior to Applying the "Marsh" or Other Test For the Element.

Occurrence.

This metal is quite widely distributed in nature, while in the free state it is occasionally found in distinct crystals. It is more abundantly distributed in the combined stated, as *Arsenolite* [As_2O_3], or the sulfids, as *Orpiment* [As_2S_3], and *Realgar* [As_2S_2], or in the form of the metallic arsenids. *Arsenical iron* [$FeAs_2$], and *Arsenopyrit* [FeAsS]. It is also found in reducing ores of Nickel, Cobalt, etc., being obtained as a by-product of *Cobalt Glance* [CoAsS] and *Nickel Glance* [NiAsS].

Preparation.

Metallic arsenic is prepared by subliming the native mineral or by reducing arsenous oxid with charcoal:

$$As_2O_3 + 3C = 2As + 3CO.$$

Probably the largest quantity is prepared by subliming arsenical pyrits:

$$2FeAsS = 2As + 2FeS.$$

In the first process above mentioned, the arsenical pyrits are oxidized by roasting, that is, heating with access of air. This gives the oxids of the three elements, Fe_2O_3, As_2O_3, SO_2. The first remains behind in the retort, SO_2 escapes as a gas, and As_2O_3 sublimes. It may be purified by resubliming. The metallic arsenic is obtained by reducing the oxid with charcoal.

$$As_2O_3 + 3C = 3CO + 2As.$$
$$2As_2O_3 + 3C = 3CO_2 + 4As.$$

Some Arsenic can be obtained by excluding air and heating FeAsS.

$$FeAsS = FeS + As.$$

Properties.

Arsenic appears usually in the form of a steel-gray, brittle, crystalline mass, of metallic luster.

It is a good conductor of electricity.

It is easily volatile, then possessing a garlic odor.

It hardens lead when alloyed with it; hence its use in shot manufacture.

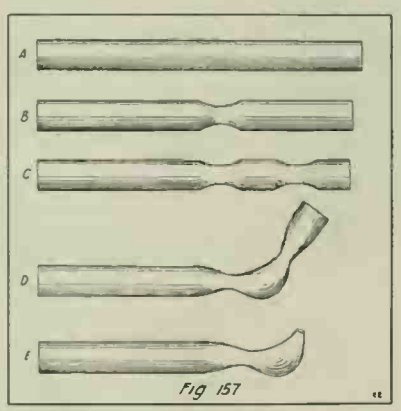
When roasted in air, it forms As_2O_3. When air is past over it in a hot combustion tube, it burns with a blue flame.

It has great attraction for chlorin, burning in it like antimony, to form the chlorid, $AsCl_3$.

Like its salts it is poisonous when taken into the stomach.

At a temperature higher than 180°C., it unites directly with most elements.

It unites with metals to form arsenids, analogous with the sulfids.



Oxids.

Two oxids are known Arsenious Oxid (As_4O_6) [usually written As_2O_3 and called arsenic trioxid, Arsenious Acid, Arsenic, White Arsenic, etc.], and Arsenic Oxid [As_2O_5]. The former only is important, being the most important commercial compound of the element. From this other compounds of the metal are formed. It is a white substance, sometimes amorphous and sometimes crystalline, which resembles flour when pulverized. It dissolves very slightly in cold water, upon which its particles seem to have a repellent action, but on boiling for a long time more dissolves. The best solvents are Hydrochloric Acid and Alkalies. With Hydrochloric acid it forms:

$$As_2O_3 + 6HCl = 2AsCl_3 + 3H_2O.$$

Salts.

There are two classes of salts, the *—ate* and the *—ite*, of which Sodium Arseniat [Na_3ASO_4] and Sodium Arsenit [Na_3AsO_3] are examples. In the former, the valence of Arsenic is 5, in the latter 3. The *—ite* salts are more frequently met with. The

Successive Stages In Preparing a "Marsh Tube."

Sulfid [As_2S_3] is a permanent and brilliant yellow pigment made by passing Hydrogen sulfid gas into a solution of an *—ite* salt. Scheele's Green [$HCuAsO_3$] and Schweinfurt or Emerald Green [$Cu(AsO_2)_2.CuAsO_3C_2H_3O_2$] both go under the name of "Paris Green," and are much used as pigments, especially for green window blinds, shipping tags, silks, etc.; also extensively employed by farmers to exterminate the potato beetle. Wall papers at one time almost always contained Arsenic, but now—owing to better substitutes and legislative prohibition—they rarely contain it. Scheele's Green is made by adding a solution of copper salt, as $CuCl_2$, to an arsenious salt solution, as HNa_2AsO_3. If these are nearly neutral, a precipitat of $HCuAsO_3$ is obtained, but if strongly acidified with Hydrochloric acid or alkalized with NH_4OH, no precepitat falls, which is the same as saying that Scheele's Green is soluble in either of the reagents. Fowler's Solution —used in medicine—is Potassium Arsenit.

Tests.

There are Four important tests, *Marsh's, Reinsch's, the Carbon,* and the *Hydrogen Sulfid*. Besides these there are *The Modified Gutzeit Test, Bettendorff's,* etc.

MARSH'S TEST.—This is the most delicate and interesting, and consists in first forming Arsin [AsH_3], then decomposing it and subliming the arsenic. Any soluble arsenical compound in presence of nascent hydrogen forms Arsin, which is readily decomposed by heat, when the arsenic sublimes. By this process a quantity far too small for the most delicate balance, can be detected,—in fact a mere trace of the element.

Explanation.—Suppose the compound to have the composition AsX_3, in which X is any nonmetallic monad. Hydrochloric acid gives this reaction:

$$AsX_3 + 3HCl = AsCl_3 + 3HX.$$

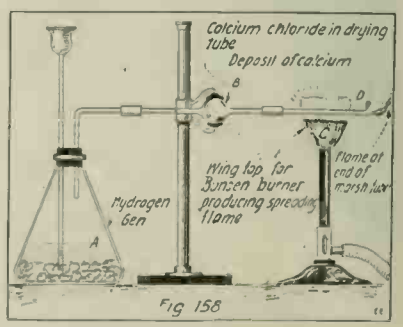
Nascent Hydrogen decomposes $AsCl_3$ and combines with both elements.

$$AsCl_3 + 6H = AsH_3 + 3HCl$$

The Arsin passes out and is burned together with the excess of hydrogen.

$$2AsH_3 + 6O = As_2O_3 + 3H_2O.$$

A Bunsen flame decomposes the Arsin.



$$AsH_3 = As + 3H.$$

when the metal sublimes in the capillary tube. The question arises whether any other element than arsenic would act in a similar way. Antimony acts almost exactly like it, forming gaseous and combustible Stibin [SbH_3], which likewise decomposes and sublimes as a metallic mirror. Several tests serve to distinguish the sublimed Arsenic from Antimony, the best being the solubility of Arsenic in Sodium Hypochlorit [NaClO] and the insolubility of Antimony. The quantity of Arsenic can be determined by comparing the depth of shading of the deposit with that of tubes containing a known quantity.

REINSCH'S TEST.—This consists of depositing Arsenic on copper, then oxidizing the Arsenic and subliming the As_2O_3 formed.

The compounds of Arsenic will first change to $AsCl_3$ by Hydrochloric acid. The copper in the heated acid will withdraw the arsenic and deposit it, leaving copper chlorid in solution. Heat will vaporize the arsenic, which at the same time will combine with the oxygen in the tube to form As_2O_3, and this in turn will sublime as a white solid on the cold sides of the tube. Identification is then made by examination under a microscope, when a portion of it

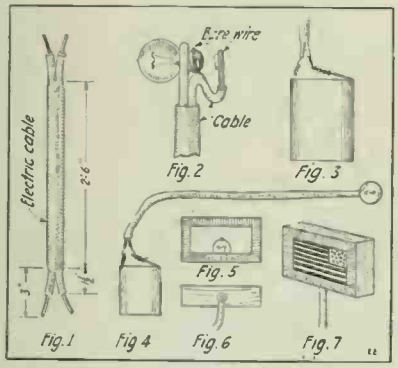
Apparatus Utilized For Performing Marsh's Test For Arsenic.

www.americanradiohistory.com



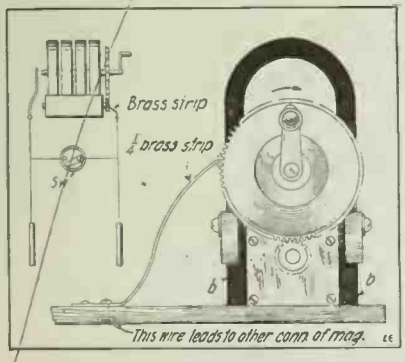
This department will award the following monthly prizes: First Prize, $3.00; Second Prize, $2.00; Third Prize, $1.00.
The purpose of this department is to stimulate experimenters towards accomplishing new things with old apparatus or old material, and for the most useful, practical and original idea submitted to the Editors of this department, a monthly series of prizes will be awarded. For the best idea submitted a prize of $3.00 is awarded; for the second best idea a $2.00 prize, and for the third best prize of $1.00. The article need not be very elaborate, and rough sketches are sufficient. We will make the mechanical drawings. Use only one side of sheet. Make sketches on separate sheets.

FIRST PRIZE, $3.00

AN ELECTRIC FLAG FOR THE LAPEL.

The materials necessary for this are: 3 feet of electric cable, a flashlight bulb, a flashlight battery, a small U. S. (or

An Electric Lapel Flag Which Anyone Can Make from a Piece of Twin Cord, a Pocket Flashlight, and a Small Paper Flag.



service flag) paper flag and some cardboard. Fix the cable as shown in Fig. 1, and then bend both wires on each end, as shown in Figs. 2 and 3. Make a cardboard box an inch larger each way than the flag and ¾-inch thick. On the front cut out an oblong opening ⅛-inch smaller all around than the flag. Paste the flag over this.

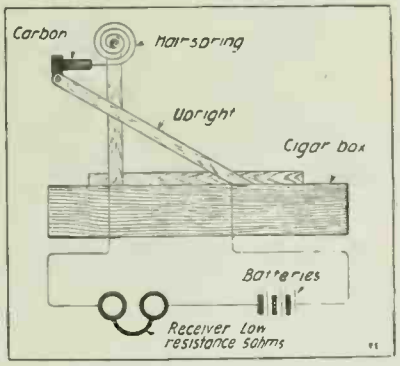
INTENSIFYING THE SHOCK FROM MAGNETOS.

Most people are aware that the "mag" out of an old-fashioned telephone makes a fine "shocker." My "rig" will increase its shocking capacity tremendously, as all who try it will be fain to believe.

Cut a piece of thin brass of suitable size to rest against the driving wheel when it (the brass) is secured to the base. No

The Addition of a Simple Spring Greatly Intensifies the Strength of Shock Obtainable from a Magneto.



dimensions are given as the mageto-ringers vary in size.

Contributed by L. G. S. TROREY.

SECOND PRIZE, $2.00

THIS MICROPHONE MAKES AUDIBLE THE FLY'S FOOT-STEP.

This microphone, when properly constructed, is capable of making audible the footfall of a fly, the drawing of a thread across the instrument, the slightest touch on the table on which it is placed, the blowing of one's breath upon it, etc., etc. To construct this instrument first take a cigar box and remove the lid. Next hunt up a discarded alarm clock and remove the hair-spring. Secure a piece of wood, 4"x1½" upon which to fasten the uprights, and a piece of copper sheeting or any other suitable metal for the uprights. Connect these as in the diagram. From an old flashlight battery obtain the necessary carbon. Fasten the hair spring onto one upright, and the carbon to the other, first hollowing out a

A Supersensitive Microphone Made from a Cigar Box, a Piece of Carbon, and a Low Resistance Telephone Receiver.

place in the end of the carbon to receive the end of the hair spring; about 3/16 to ⅛ inch deep is sufficient. The right pressure of the spring upon the carbon must be obtained before the instrument will transmit properly. The spring must touch the carbon at all times. Connect up a battery (dry cell) and a low resistance (5 ohm) receiver, ascertain the correct pressure, and the microphone is complete.

Test it by gently touching the cigar box; a whirring noise will be heard if everything is all right. Blow gently upon it; it again whirrs. If placed in the open it will indicate when the wind is blowing, and by the amount of noise, the velocity can be judged. Under certain conditions, it will transmit speech, whistling, and so forth.

THIRD PRIZE, $1.00

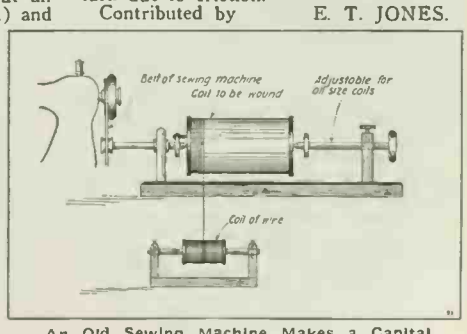
CONTACT POINT FROM UPHOLSTERY NAIL.

An ordinary upholstery nail is flattened with a hammer and a hole punched thru it with a set punch, as shown in sketch. The hole serves to thread and hold the wires. This is a cheap and practical contact point.

Contributed by BERT O'LEARY.

At Left—Contact Point Made from Upholstery Nail. At Right—The Platinum Ring That Becomes Red Hot in the Presence of Alcohol.

WHAT MAKES THE PLATINUM RING HOT?



If a platinum ring (or even a piece of platinum wire) is warmed gently for a few moments and then suspended in a glass, having a small amount of alcohol in the bottom, the platinum will become red hot. The glass had best be covered with a piece of pasteboard having a hole in the center. The phenomena may be explained by the fact that platinum has the peculiar property of causing certain gases to condense on its surface. The condensation of alcohol fumes is so rapid as to cause the platinum to become incandescent.

A HOME-MADE GAS TORCH.

As I needed a gas torch I set about to make one. I first procured two pipes, one

To Make This Gas Blow Torch You Will Require a Bicycle or Other Small Pump, a 1 to 5 Gallon Can, and Two Lengths of Rubber Tubing to Lead the Gas and Compress Air to the Torch Handle.

3/16 and one ¾ inch in diameter and about 8 inches long. I then drilled a hole in the quarter inch pipe and bent it as shown in drawing and set the other pipe into it. The handle is of oak with the edges rounded and two holes drilled thru it to fit each pipe. The air and gas supply come thru rubber hoses. A very good air compressor is made out of a bicycle pump and a one gallon can; the gas may be taken from the gas service pipes or from a carbid generator.

Contributed by HERBERT PEHRSON.

HINTS ON DRILLING GLASS.

Drilling glass is a difficult proposition and very few amateurs possess tools suitable for this purpose. The following apparatus will drill holes, varying in size from the smallest up to an inch or more.

First procure a brass tube the outside diameter of which measures the same size as the desired hole. Revolve this on the surface of the glass, either by hand or better by means of a small hand drill. The drilling must be started by allowing the lower end of the tube to be guided by a wooden block, with a hole cut in it the size of the tube. After the tube has past thru the glazing this guide can be removed. An excellent abrasive for this drill is emery dust and turpentine. It is an excellent idea to drill from both sides, since this results in a clean, smooth hole.

Contributed by PAUL G. EDWARDS.

COINS FOR WEIGHTS.

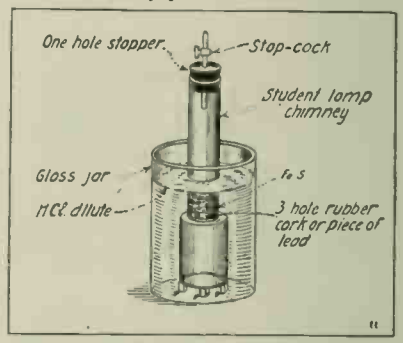
In an emergency, ordinary coins can be used as weights. The weights given in the following table are near enough for all the usual purposes.

Dime weighs	40 grains
Cent weighs	50 grains
Nickel weighs	80 grains
One-quarter Dollar weighs	100 grains
One-half Dollar weighs..	200 grains
One Dollar weighs.....	400 grains

By simple addition and subtraction a great many different weights can be made with these coins. For instance, to obtain a weight of 20 grains, place a nickel on one side of the scales and a quarter on the other, and then add enough of the chemical to balance it.

Contributed by HUGO J. ENGEL.

A RELIABLE HYDROGEN SULFID GENERATOR.



Herewith is a plan and description of a simple and cheap hydrogen sulfid generator.

This hydrogen sulfid generator has given very satisfactory service to the author. It can also be used for generating hydrogen, carbon dioxid, etc.

The necessary parts are:

1. Student lamp chimney.
2. Glass or porcelain jar (a large fruit jar will do).
3. Glass stop cock.
4. Rubber stoppers, three hole and one hole.
5. Iron sulfid (FeS).
6. Hydrochloric acid (HCl).

Contributed by JOHN R. BUXTON.

A Simple Yet Reliable Hydrogen Sulfid Generator Made From a Few Odd Pieces of Apparatus to Be Found About the Laboratory.

THE PREPARATION AND USE OF BLUE-PRINT PAPER.

The following describes the manufacture of blue-print paper in terms that can be easily understood by any one. No difficulty should be experienced in either the making or the use of the paper.

In order that the best results be obtained it is necessary that good material be used. All vessels in which the solution is made should be kept clean and when not in use should have water in them as far as possible. Do not use soap when washing the trays, as the least trace will do harm to the solution.

Where ordinary work is to be done, any kind of well sized paper will answer, if tough enough to be washed. Different grades of unsensitized papers can be bought at engineers and photo supply houses.

The following formula is for a good solution that will give excellent results to the amateur; this solution is made up of two salts, dissolved in water and applied to the surface of the paper:

Solution No. 1.

Ferrocyanid of potassium.... 1 oz.
Pure or distilled water..... 6 oz.

Solution No. 2.

Ammoniocitrat of iron..... 1 oz.
Pure or distilled water..... 6 oz.

When solutions are to be used mix equal parts of 1 and 2 and filter thru cotton or filter paper. This solution we will call No. 3.

The solutions should be applied to the paper in a dark and dry room with a very subdued light—just enough to barely see by.

Small sheets of the paper may be best covered by floating upon the surface of No. 3. This is done by taking a sheet by two diagonal corners and laying it gently on the surface of the solution. This method does away with the possibility of air bubbles forming.

One minute or less will be sufficient for sensitizing. Remove the paper by drawing over the edge of the tray to remove any surplus liquid. Take care to prevent any solution from getting on the back of the paper.

Large pieces are best sensitized by tacking down upon a smooth table with thumb tacks and painting the solution on with a wide camel's hair brush. Take care to get it on quickly and evenly. Dry the paper by hanging up by its corners to a wire so that it will swing free. Before sensitizing a batch of paper it would be best to make a trial sheet and print it. The solution may not be mixed properly or the paper may be too absorbent, in which case the solution will go into the paper and will not come out when washing, thus causing the print to fade in a short time.

After the paper has dried hard and without the slightest trace of dampness it should be rolled up and put into an airtight (tin or cardboard) tube and kept in a dark and dry place.

Printing is the exposing of the sensitized paper to the action of a powerful light with the copy to be printed placed over the paper. The direct rays of the sun are best for printing, but the electric arc is nearly as quick and has the advantage of being always constant—regardless of weather.

The drawing, tracing or negative is placed in the frame next to the glass with the paper under it, having its sensitive side up. Exposure will vary from two to ten minutes, according to the light and tracing. The correct time is only found by experience.

After the paper is sufficiently exposed, it is taken from the frame and immersed in a bath of clean running water. A print should be washed for not less than fifteen minutes or it will fade when placed in the light.

Excellent prints may be made in the following manner: Slightly expose the print so that when it is washed the white lines are not clear but appear bluish. Take the print out of the bath and lay it on a table and sponge it with a solution made up of one pound of bichromat of potash and two gallons of water. The lines will come out pure white and the background an intense blue. Wash print thoroly and dry.

White lines may be added to blue prints by the use of a solution made of soda and water to which a small quantity of prepared chalk has been added to thicken it. This solution may be applied with a ruling pen. Engineers generally use a white, red or yellow pencil for making corrections.

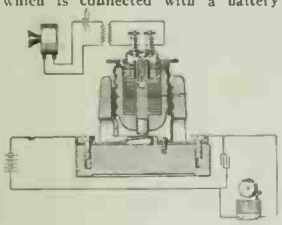
Telephone Amplifier.

(No. 1,280,556; issued to Louis Scher.)

A telephone amplifier providing a loud-speaking portable telephonic

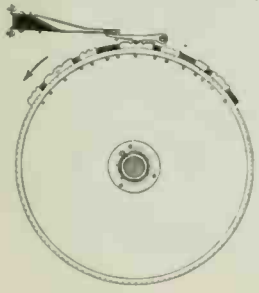


apparatus enabling persons with impaired hearing to satisfactorily use the ordinary telephone. The usual Bell telephone receiver is placed on top of the cabinet in which there is an opening communicating with a dictaphone transmitter. The transmitter in turn is connected from a rheostat and battery as well as switch-hook to a low resistance, loud-speaking telephone receiver.

Signaling Apparatus.

(No. 1,280,705; issued to Fulton Gardner.)

An ingenious signaling apparatus comprising an electromagnet in a receptacle, together with a coherer form of armature, the whole arrangement operating an alarm bell when actuated by voice or other sound waves. It is intended for bank vault protection and the like. The sound waves impinge on the microphone which is connected with a battery

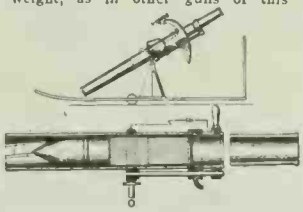


and primary of an induction coil. The secondary of this induction coil connects with the electromagnet of the relay shown in cross-section. This electromagnet acts on an iron filing armature, causing the filings to cohere, and thereby closing the bell signal circuit. A condenser is shunted across the bell in order to provide a more steady current by virtue of its charging and discharging action.

Telegraph Transmitter.

(No. 1,280,566; issued to John J. Sherry and John L. DuFrane.)

A clever mechanical arrangement comprising an automatic machine for sending out dots and dashes, either on a telegraph or radio circuit, by means of which one unskilled in the art or unfamiliar with the code may send a distress message from a ship, etc. The device should prove a fine auxiliary in all ship radio rooms, especially in case of fire, etc., as the transmitter could keep the radio ap-

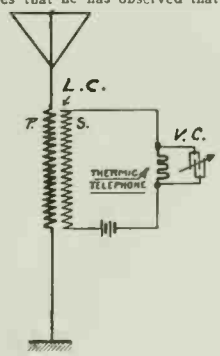


paratus sending out distress calls with location and name of ship, even tho the operator had to abandon the wireless room. There is provided a circular disk with a groove around its perifery, and in this groove there can be placed various telegraph character slugs and spaces. Thus the notched slugs corresponding to dots and dashes actuate a pawl member, opening and closing electric contacts in the manner apparent.

Non-Recoil Gun.

(No. 1,280,576; issued to Andrew J. Stone and William Shuker.)

A novel form of non-recoil gun intended for use on aircraft, etc., in which the recoil of the shell charge is minimized by the discharge from the gun of an "inertia mass," in a direction opposite to that in which the main projectile is shot. The inertia mass in this design is a small affair, and the reduction in its weight, as in other guns of this

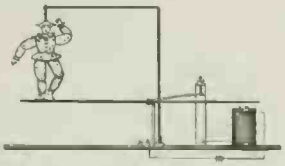


type, is made up for by the increased friction encountered by the mass, owing to the reduced bore of the barrel thru which it is simultaneously discharged with the main projectile. The inertia shell may be a copper disc or cup. The charge of explosive is fired by an electrical primer as shown, or by other means. The design of the gun is so computed that the inertia due to the heavy weight of the effective projectile plus the light frictional resistance of the projectile in the gun barrel, shall equal the inertia effects of the lighter weight of the disc plus the heavier frictional resistance of the said disc in the barrel.

Thermic Radio Detector and Telephone.

(No. 1,281,742; issued to Hendrik Zwaardemaker.)

This novel invention comprises a new form of thermic telephone and detector combined, and is suitable for use in wireless telegraphy and telephony. Prof. Zwaardemaker states that he has observed that the

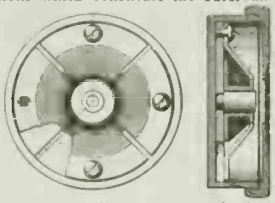


sensitiveness of the thermic telephone, serving simultaneously as detector, can be considerably increased when it works with polarization, i. e., by pre-heating it by means of a constant current such as that supplied by a battery as shown in the diagram. The battery may have a tension of two to four volts, and for increasing the sound, a variable and tunable condenser is connected in parallel to the thermic telephone element.

Dancing Toy.

(No. 1,280,307; issued to Harry Rust.)

This is an interesting electric toy and comprises a jointed doll or other figure suspended at the top in the manner shown. Underneath the fig-

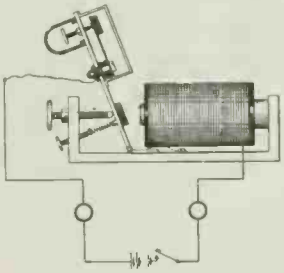


ure there is a spring platform, one end of which is provided with an electric contact, and also an electromagnet to attract it. The action is as follows: When the switch is closed, the magnet attracts one end of the spring armature, but immediately the circuit is broken and it flies back. These rapid vibrations of the spring over the magnet, transmit similar impulses to the opposite end of the armature which forms the tread under the figure, and which results in many curious and grotesque steps being evolved for the amusement of the children.

Novel Telephone Receiver.

(No. 1,283,304; issued to Thomas Rhodus.)

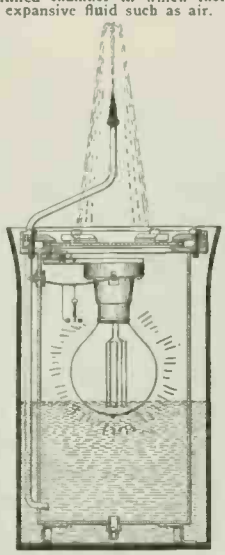
The receiver as shown is of the monocoil type, and the central iron core is secured to a flat base plate. In the improvement here shown, this base plate is formed with radial slits in its marginal portion to provide a series of integrally connected sectors corresponding in number with the series of independent sections which constitute the outer an-



nular pole-piece. This pole-piece comprises a series of radially disposed iron sections. The resistance of the coil is 75 ohms for telephonic work.

Electromechanical Interrupter.

(No. 1,282,388; issued to François de Cannart d'Hamale.)

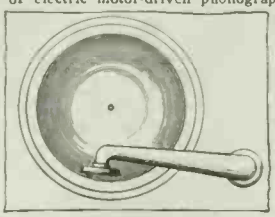


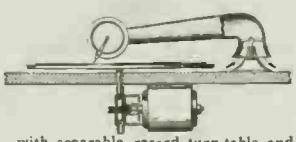
A unique electromechanical interrupter wherein the circuit is made and broken, not by virtue of an electromagnet acting on an armature and pulling it away from a stationary contact screw, but by means of a weighted auxiliary spring placed in a hermetically sealed compartment and acting by inertia. The weight supported at the top of the contact spring tends to keep on moving when the armature itself is suddenly stopt by striking against the magnet core, thus providing a very sudden break, which is highly desirable for operating induction coils.

Electric Lamp Fountain.

(No. 1,280,784; issued to Matt Luckiesh.)

An electric lamp fountain operated by the heat radiated from an incandescent lamp placed in a confined chamber in which there is an expansive fluid such as air. The





inventor mentions that a 150-watt lamp has worked the apparatus. The liquid sprayed out thru the small capillary tube falls back into a second chamber, thru which the water can reach the inner chamber again thru a check valve. A thermostat may be used to make and break the circuit intermittently when desired. The cover of the fountain may be of glass and colored when preferred for the purpose of transmitting upwardly thru the fountain spray a portion of the light from the lamp.

Electric Phonograph.

(No. 1,281,282; issued to Hans Brockmüller.)

The idea is to provide a simple form of electric motor-driven phonograph

with separable record turn-table and tone arm, so that for economical and other reasons it is not necessary to have a large special cabinet about the house. Any table can be quickly converted into a first-class phonograph by this scheme, the motor and a vertically driven shaft being secured underneath the table. The turn-table has a shaft which passes thru a hole in the top of the table, so as to engage the driving shaft frictionally. The tone arm has a special suction foot which does not require any screws, and the sound emanates around this foot.

Our Amateur Laboratory Contest is open to all readers, whether subscribers or not. The photos are judged for best arrangement and efficiency of the apparatus. To increase the interest of this department we make it a rule not to publish photos of apparatus unaccompanied by that of the owner. Dark photos preferred to light-toned ones. We pay $3.00 prize each month for the best photo. Address the Editor, "With the Amateurs" Dept.

"Amateur Electrical Laboratory" Contest

THIS MONTH'S $3.00 PRIZE WINNERS—F. L. BROOKS and W. P. CECIL

THE accompanying photos are views of our Electro Chemical Laboratory and Radio Station (which is now closed). We have quite a number of electrical apparatus such as Oudin and Tesla coils, motors, spark coils, 12 volt storage battery, Leyden jars, electrolytic-interrupter Einthoven galvanometer—which was described in the ELECTRICAL EXPERIMENTER several months ago, 50 watt step-down transformer, also 200 watt transformer located behind switch-board and controlled by a five point switch, ammeter and voltmeter also on switch board, arc spot light which will throw a beam of light over a mile, small step-up transformer, condenser and spark gap. Our Chemical "Lab" consists of about 85 chemicals and about 15 pieces of apparatus such as test tubes, Florence flasks, delivery tubes, hydrometer and other apparatus for carrying on experiments on a small scale. Last of all comes our work bench where everything has its beginning. We have a vise, gasoline blow torch, pliers, screw-drivers, twist drills and numerous other accessories. We also have a good supply of binding posts, screws, magnet wire, copper, brass and all such junk as is found in a red-headed bug's "Lab" like my pal's, not saying anything of myself.—FLOYD L. BROOKS and WM. P. CECIL, Ardmore, Oklahoma.

HONORABLE MENTION (1 Year's Subscription to the "ELECTRICAL EXPERIMENTER") T. C. QUAYLE

MY Chemical "Lab" consists of over 150 chemicals and reagents, also apparatus such as pipettes, burettes, retorts, test tubes, thistle tubes, delivery tubes, crucibles, casseroles, condensers, a Centigrade-Fahrenheit thermometer, chemists' scales, and many other pieces of laboratory glassware and apparatus, with which I carry on many interesting experiments in quantitative, qualitative and spectrum analysis. I also have gas, a Bunsen burner and a spigot for water in the "Lab". I have over 100 pieces of apparatus in my electrical "Lab", and have made a storage battery as described in the 1917 (Nov.) issue, also an arc searchlight, experimental arc furnace, magnetless buzzer, selenium cell (Bidwell type), Wheatstone bridge, electroscope, electrophorus, (sensitive) coherer, electrolytic rectifier and interrupter, Leyden jars, and many other pieces of apparatus described in the ELECTRICAL EXPERIMENTER. I also have an Oudin coil which is operated by an E. I. Co. half kilowatt coil and a rotary spark gap of my own design, also 110 volt and battery motors, hand generator, hot wire ammeter, small storage cell, switches, fuse blocks, Geissler tubes, etc.

My work-shop is complete in tools for both wood and metal working and here is where I made the articles described in the "E. E." I have drills for both wood and metal, braces, chisels, files, saws, wrenches, planes, pincers, levels, two sets of taps and dies, one for small rods, the other for pipes; also an emery wheel and bench lathe, which I designed and built.—THOMAS C. QUAYLE, Berkeley, Cal.

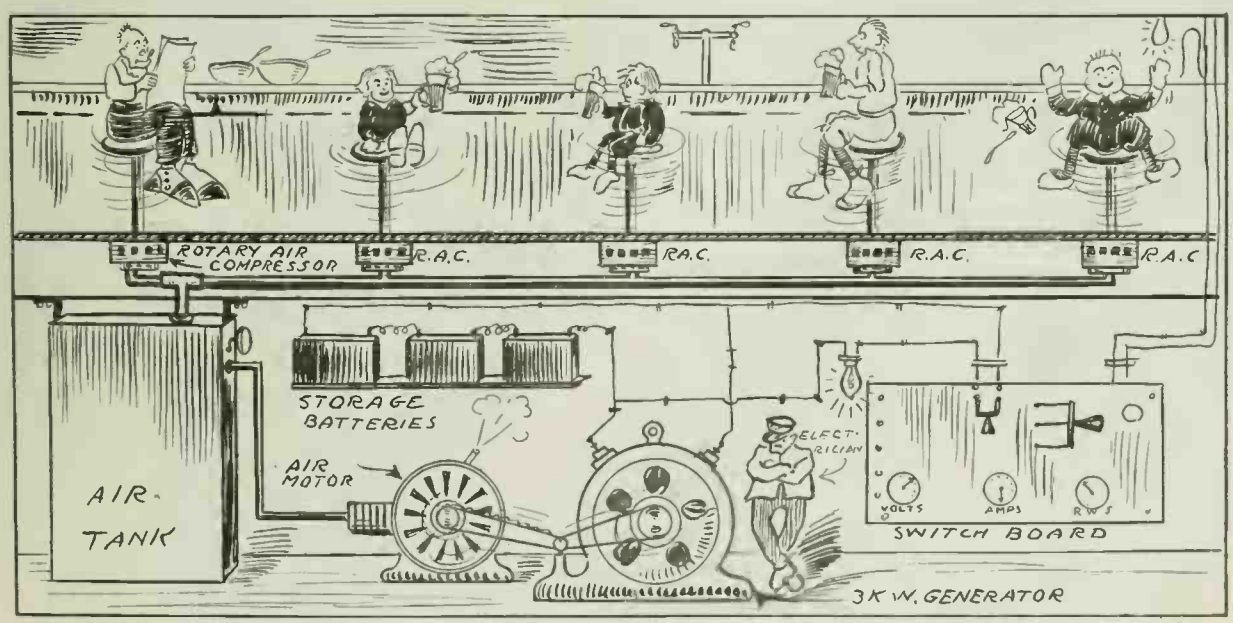
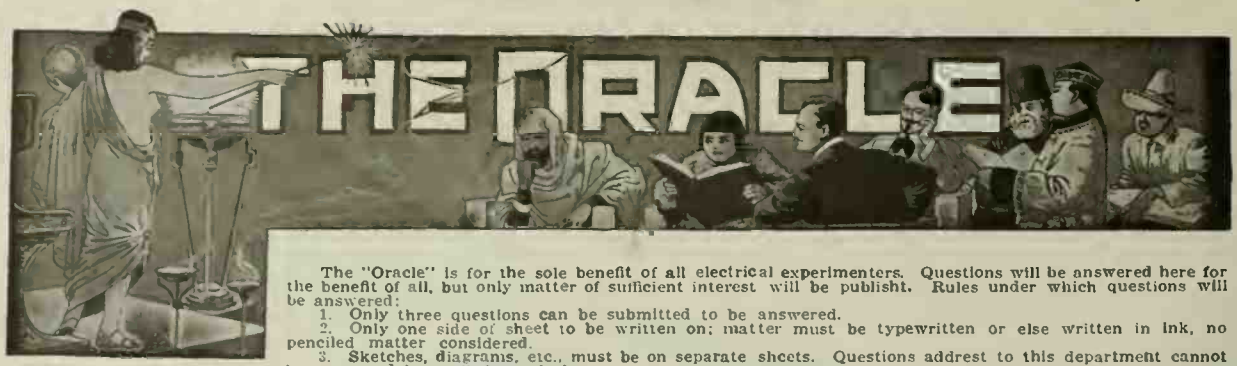
Phoney Patents

Under this heading are publisht electrical or mechanical ideas which our clever inventors, for reasons best known to themselves, have as yet not patented. We furthermore call attention to our celebrated Phoney Patent Offizz for the relief of all suffering daffy inventors in this country as well as for the entire universe.



We are revolutionizing the Patent business and OFFER YOU THREE DOLLARS ($3.00) FOR THE BEST PATENT. If you take your Phoney Patent to Washington, they charge you $20.00 for the initial fee and then you haven't a smell of a Patent yet. After they have allowed the Patent, you must pay another $20.00 as a final fee. That's $40.00! WE PAY YOU $3.00 and grant you a Phoney Patent in the bargain, so you save $43.00!! When sending in your Phoney Patent application, be sure that it is as daffy as a lovesick bat. The daffier, the better. Simple sketches and short descriptions will help our staff of Phoney Patent Examiners to issue a Phoney Patent on your invention in a jiffy.

HUN U BOAT UTILIZER

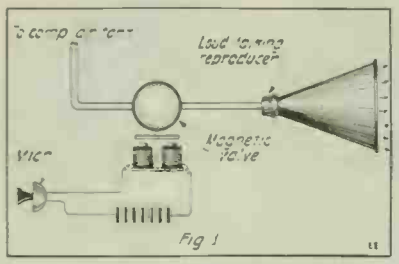


Prize Winner: HUN U-BOAT UTILIZER. Particularly Adapted for Traffic Over Deserts. Take One Gyro Electric Destroyer a la Gernsback, Knock Out All Machinery, Axles, etc., and Mount Plate Glass 16-Inches Thick in Framework Covering Both Sides. Make Waterproof and Fill Cruiser with Pure Prohibition Liquid; Also one Hun Submarine. Weight of Submarine Pressing Against Sides, as Shown, Navigates Cruiser at Rate of 25 Knots an Hour with a Fair Zephyr Breeze Nor' by West. Inventor, Jose Matz, 300 Baker St., San Francisco, Cal.

I'SCREAM GENERATOR

I'SCREAM PARLOR GENERATOR. In Order to Save Tremendous Energy Now Going to Waste In All Ice-Cream Parlors, Due to Rotating Seats, My New Patent Provides Extending Shaft to the Rotating Seat, Which Shaft Operates Rotary Air Compressor. This Control Operates Air Tank, Air Motor, Dynamo, etc. The Great Advantage to this Scheme Is That the Device Works Better the More Ice-Cream You Eat Because of the Added Momentum. Separate Patent Application Provides to Charge Customers an Extra Nickel for Allowing Them to Spin Around. Hoover says Economize, Hence no Free Rides. Inventor, Garrett W. Lewis, Yuba City, Cal.

www.americanradiohistory.com

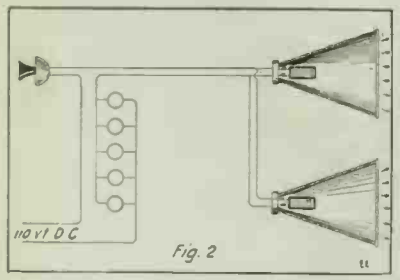


The "Oracle" is for the sole benefit of all electrical experimenters. Questions will be answered here for the benefit of all, but only matter of sufficient interest will be publisht. Rules under which questions will be answered:

1. Only three questions can be submitted to be answered.
2. Only one side of sheet to be written on; matter must be typewritten or else written in ink, no penciled matter considered.
3. Sketches, diagrams, etc., must be on separate sheets. Questions addrest to this department cannot be answered by mail free of charge.
4. If a quick answer is desired by mail, a nominal charge of 25 cents is made for each question. If the questions entail considerable research work or intricate calculations a special rate will be charged. Correspondents will be informed as to the fee before such questions are answered.

HURLING THE VOICE ONE MILE.

(979) W. J. M. asks:



Q. 1. Is there any practical way of enormously amplifying the human voice so that same can be distinctly heard for a radius of, say, a mile, the atmosphere being comparatively free of other disturbances at the time?

Comprest Air Loud Talker Such As Used On Phonographs, and Susceptible of Development For Hurling Voice Waves a Distance of One Mile.

I understand that there are telephone transmitters now made for handling heavy currents of electricity. It occurs to me that possibly the above could be accomplisht by using such a transmitter in connection with a mammoth receiver and a suitable horn.

A. 1. One of the leading phonograph companies have developed a very clever and powerful form of comprest air amplifier which we believe might be worked up on a sufficiently large scale to answer your requirements. In this system a low power aural or electrical voice signal is caused to act, by means of a relay or other appropriate device, on an extremely sensitive valve, which permits successive puffs of comprest air from a tank or bellows to pass out thru a large amplifying horn and reproducer. We also believe that the de Forest amplifier might solve your problem, as one model is capable of amplifying 1,000,000 (one million) times. Also their Mr. C. V. Logwood has stated that he believes that your problem of amplifying the human voice so that it could be heard for a radius of one mile can be solved by modern engineering design. He states that by means of microphones suitably connected to a large *Oscillion* bulb that he has actually heard the human voice at a distance of one-half mile in California.

This Diagram Shows the Microphone Circuit For a 110 Volt D. C. Loud Talker, Having a Bank of 110 Volt Lamps in Series With the Reproducers.

The Alexanderson G. E. Co. magnetic amplifier should be of service to you in this connection. This clever and highly efficient magnetic amplifier was described in detail in the April, 1916, issue of the *Proceedings of the Institute of Radio Engineers.*

Several companies manufacture straight electro-magnetic systems of amplifying the voice, which systems are operated from 110 volt circuits. We can supply names of these concerns on receipt of stamped envelope.

Relative to these systems, the Oracle Editor would say that he has heard the loud talkers put out by one of these concerns throw the voice a distance of from 800 to 1,000 feet. The horns used are not over 2 feet long in this system, but the makers utilize special electro-magnetic reproducers which are connected in parallel when two or more are used, and these in turn are connected in series with a special microphone capable of operating on 110 volts D. C. and a bank of incandescent lamps.

ARTICLES SCHEDULED FOR MARCH "E. E."

"My Inventions"—No. 2 of a series by Dr. Nikola Tesla. Written exclusively for the ELECTRICAL EXPERIMENTER.

"A Wonderful New Electric Machine that Sorts Tobacco Leaves by Size," by George Holmes.

"How Powerful Electric Gyros Stabilize Ocean Ships"—Illustrated with excellent photos—by J. W. Harvath.

"Multiplex Telephony and Telegraphy and How It is Done," written by a Telephone Engineer.

"Exploring Polar Regions and the North Pole by Airplane."

"Locating Ore Bodies Underground by Electricity—A New Method."

A New Talking Motion Picture Invention.

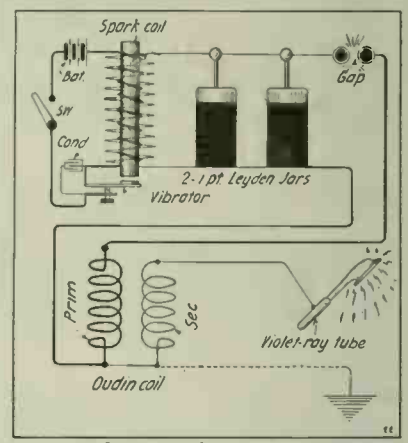
"How Jimmy Saved the Bank"—A cracker-jack electrical story, by F. W. Russel.

"Experiments in Radio-Activity—Part III," by Ivan Crawford.

A Wavemeter and Decremeter Design for Radio Students, Operators and Inspectors. With data on Inductances, condensers, etc., by H. Winfield Secor, Assoc. I. R. E.

Practical Electra-plating, by Joseph Haas.

"Efficient Radio Transmitting," by Donald H. Hassell.



"Experiments With Ultra-Violet Light, for Amateurs," by J. C. Morris, Jr.

OUDIN COIL CONNECTION.

(980) Forrest A. Miller, Shelbyville, Kentucky, writes:

Q. 1. Asking several questions about Oudin and Tesla coils.

A. 1. By means of high frequency Tesla or Oudin currents you can charge the body so as to emit sparks and charge other bodies or persons, etc., and you will find the apparatus and method of doing this completely described in the book you are securing, viz.: "The Experimental Electricity Course"—which contains a special chapter on high frequency currents, with diagrams and full description of the apparatus used.

Hook-Up For Spark Coil, Leyden Jars, Spark Gap, Oudin Coil and High Frequency Electrode For Giving So-Called Violet Ray Treatment.

We can also very highly recommend a book by Transtrom, entitled "Electricity at High Pressures and Frequencies" which our "Book Department" can supply at $2.15 prepaid.

The diagram herewith shows how a spark coil, Leyden jars, spark gap and Oudin type of high frequency coil are properly connected. The ground connection is optional, but usually intensifies the unipolar discharge for electro-therapeutic requirements.

SIX-INCH SPARK COIL DATA.

(981) Marshall M. Wrenn, Baltimore, Md., asks the Oracle:

Q. 1. For data on six-inch spark induction coil.

(*Continued on page 726*)

www.americanradiohistory.com

FREE Test Lesson In Draftsmanship

Send for this free lesson which explains the Chicago "Tech" method of teaching Draftsmanship by mail. Positions at big salaries are now waiting for competent men. Even draftsmen of limited training and experience are snapped up and paid good salaries. If you are dissatisfied with your opportunities, learn Draftsmanship. Chicago "Tech" will train you in the most practical way in the shortest time. Mail the coupon today and let us tell you about the Chicago "Tech" method. The free lesson will show you how well equipped you are to follow Draftsmanship. Enroll in the course only if you decide that you can take it up to advantage. No cost, no obligation on you to make this investigation. Send the coupon.

$25 to $100 a Week

Draftsmen always command good salaries. And now when American industries are to be called upon to meet vast foreign and increased domestic demands, the opportunities are greater than ever. This is the time for you to prepare for a better position—a higher salary.

Come to the College or

Learn At Home

Hold you present position while training. Our experts will instruct you by mail. Only your spare time is required. You are directly under practical draftsmen and engineers. You are taught exactly the work required in the drafting rooms of big concerns. No time put in on unnecessary studies. This means thorough instruction and early graduation.

Easy Payments

The fees for Chicago "Tech" Courses are very moderate—and you can pay on easy terms. And also, you obtain in a few months what it would take several years to acquire by ordinary methods. You can get an early start. You are soon ready to take a paying position and to quickly get back the cost of your course. Then keep on earning more.

FREE Instruments

Every student of the Chicago "Tech" mail course in Draftsmanship receives this set of instruments, or a cash credit in case he already has a set. These instruments are of the same make and sizes as are used by high salaried experts in drafting rooms of factories, shops, railroads, etc. You use them while learning—then take them right into your practical work.

Auto and Gas Engine Course

All about automobile mechanism—its construction, operation and REPAIR—taught by mail. You train directly under the Chicago "Tech" automobile experts. Splendid opportunities open now. Send coupon and get all the facts.

Learn All This in Spare Time

Principles of the Automobile. Every point made clear about the basic principles of propulsion—steam, gas and electric cars. Power transmission systems in pleasure and commercial cars, etc., etc.

Gasoline Engines. All about the different types. A complete course in gas engine construction, operation and repair.

Power Plants and Transmissions. Application of power by 4-6-8-12 cylinder engines. Types of clutches, gears, drives, axles, etc.

Carburetors and Fuel Supply Systems. All methods demonstrated. Fuel values. How to test. Gasoline and air mixtures. Regulation, care and management, etc., etc., etc.

Lubrication and Cooling All about oils and how to test them. Splash and circulating systems. Operation in different cars explained. Diagrams and tables. Cooling systems completely illustrated, etc.

Batteries. Electrical principles explained. Instructive diagrams of wiring and connections. Coils, condensers, vibrators, etc., etc.

Magneto Ignition. Principles and practical operation of various types and systems with diagrams. Generation of current. Field, armature, high and low tension, all explained. Complete in every point.

Starting and Lighting Systems. All modern methods. Starters—spark, mechanical, air, acetylene, electric, battery—shown in detail with diagrams and full explanations. Charging. Motor and generator adjustments, etc., etc.

Know How to Find and Fix Troubles

Most complete instruction in auto repair work. Equips you for high pay or to start a business. Big demand for trained repair men and men who know how to inspect cars. This course makes you proficient. Prepares you to take a job as an expert. Not enough competent men now available.

WRITE Send the coupon and get catalog and all information about the Course, the small fee and the easy terms. All this sent on request. Mail coupon now.

Send the Coupon—Now

The sooner you are prepared the sooner you will be holding a job that pays a large salary and opens the way to advancement. Many executives, general managers and superintendents began as draftsmen.

Other institutions ask you to pay first—and then to find out later how well qualified you are for this profession. We send you the free lesson first and place you under no obligation at all. Discover your qualifications before you pay anything.

The coupon will bring the Test Lesson, free. Also information about the profession of Draftsmanship and detailed facts about Chicago "Tech" methods, the fees, terms, etc. Mark with X the branch you are interested in—or if in doubt about which course to take, write a letter stating facts about yourself and asking our advice which will be freely given. Mail either the coupon or letter today.

CHICAGO TECHNICAL COLLEGE,
245 Chicago "Tech" Building, Chicago

Without obligation to me, please send me your FREE Test Lesson and other interesting literature covering the subject indicated below.

Big Money for Boys!

Learn ELECTRICITY

There is a wonderful opportunity right now for boys who like electricity. Boys who are ambitious and will train themselves in spare time can step into positions just as soon as they are ready. Good salaries are offered to start with splendid chances for rapid promotion.

For 27 years the International Correspondence Schools have been training boys for success in electricity and over 200 other subjects. They will help you prepare right at home for a position in the line of electrical work you like best—or in any other work that appeals to you. Thousands of boys, through I. C. S. training, have stepped into fine jobs, but never were opportunities so great as now.

Let the I. C. S. help *you*. Choose the work you like best in the coupon below, then mark and mail it today. This doesn't obligate you in the least, and it will bring you information that will start you on a successful career. This is your chance. Don't let it slip by. Mark and mail this coupon *now*.

TEAR OUT HERE

INTERNATIONAL CORRESPONDENCE SCHOOLS
BOX 6174, SCRANTON, PA.

Explain, without obligating me, how I can qualify for the position, or in the subject, before which I mark X.

AN EASY WAY TO MAKE MONEY

Don't be content to plod along on a small salary. Be independent. Go in the tire repairing business. One man says "I made $60.00 the first day." Others average $200 to $500 a month. Very little capital needed. Jobs plentiful. Every motorist a possible customer. No experience needed. We teach you.

SHALER Tire Repair Outfit

Improved Wrapped Tread Method Used by Tire Manufacturers

Does as good work as the big high priced vulcanizing outfits. A boy can use it. It's the only vulcanizer that has Automatic Heat Control, and can't undercure or overcure a tire. Requires no watching or regulation.

FREE Book

"How to Open a Tire Repair Shop." It tells how to make big money. Don't delay. Write quick.

C. A. SHALER CO.
2201 Fourth St. Waupon, Wisconsin

THE ORACLE.

(*Continued from page 724*)

A. 1. We give you herewith necessary information for constructing a six-inch jump spark coil:

Primary, 220 ft. No. 13 D. C. C. wire.

Secondary, 7 lbs. No. 36 double silk covered wire (or enameled).

Core, 1¼ x 14" soft iron wire (thoroly annealed).

The primary condenser to be connected across the vibrator should comprise 4,500 sq. in. tinfoil, cut in suitable size sheets and interspersed between slightly larger paraffined paper sheets. If an electrolytic interrupter is used on 110 volts A. C. or D. C. then no primary condenser is necessary.

There should be a hard rubber insulating tube between the primary and secondary coils. The dimensions of this tube are 14¾" x 13¾" outside diameter by ¼" wall. The secondary consists of thirty-eight pies, each $^3/_{16}$th" thick, having an outside diameter of 4½". There should be placed between each section six pieces of well-soaked paraffin paper.

An excellent book dealing exclusively on spark coils building can be procured from our "Book Department" for $3.00. The title of this book is "Design and Construction of Induction Coils," by Collins. In this book there is given all the details for the construction of spark coils such as core dimensions, size of wire, length of primaries, etc.

DATA ON WIRELESS POWER TRANSMISSION.

(982) John Verrge, Detroit, Michigan, writes the "Oracle":

Q. 1. The sketch herewith shows my idea on the wireless transmission of power. Where can I find engineering data on the design of such a system? How can I figure the voltage required to transmit a given kilowattage over a certain distance? etc., etc.

A. 1. We have examined your query, together with diagram showing your ideas for the wireless transmission of power to electric railway cars, etc.

We regret to say that there is at the present time no engineering data available for solving the problems you outline, as while Nikola Tesla has successfully lighted lamps and operated motors by the one wire and no-wire wireless system for distances of 15 miles in his famous Colorado experiments, this branch of advanced alternating current engineering has not been made available in text-book form as yet.

You would do well to visit your public library and look up Dr. Tesla's book, entitled "Experiments with Currents of High Potential and Frequency".

PRACTICAL ARMATURE AND MAGNET WINDING, by Horstmann & Tousely. Leather covers, 252 pages, 128 illustrations, size 4½ x 6¾ inches. Price $1.00 in cloth; $1.50 in leather. Publisht by Frederick J. Drake & Co., Chicago.

This is a handbook for the practical electrician, especially those performing shop work and engaged in dynamo and motor repairs. The authors give the principles with special and clearly drawn illustrations of the elements of armature design, armature windings and the mechanical features such as balancing and ventilation of different types of armatures, etc. The section on armature windings is quite complete and gives all necessary information for laying out drum and lap windings, and for different numbers of field poles. The authors then give a discussion on armature troubles and testing for faults in the windings, armature calculations with wire tables, alternating current windings, et cetera. One of the most interesting sections of the work is that on field magnet winding, and of course this applies to magnet windings of any type. The special formulas and tables given greatly facilitate and simplify the calculation of field and other magnet windings, and it is written so clearly that any electrician or student can grasp the simple arithmetic involved after once reading it. An appendix of useful tables is given at the end of the book which will prove of great value in conjunction with the work treated upon.

PRACTICAL FLYING, by Flight Commander W. G. McMinnies, R. N. Cloth covers, 246 pages, profusely illustrated, size 5½ x 8¼ inches. Price $1.50. Publisht by George H. Doran Company, New York, N. Y.

An excellent course on flying instruction which is very ably illustrated by comprehensive sketches in plan and perspective, showing all of the parts of modern battle and scout 'planes, and giving from start to finish all of the necessary elements, including the reading of maps and the determination of location while in the air. This book, contrary to most semi-technical or technical treatises, is one that any aviator or flying enthusiast can read with extreme pleasure and at the same time greatly improve his understanding of the heavier-than-air flying machine. The author has the title of Flight-Commander of the British Royal Navy and knows whereof he speaks.

The chapters are subdivided under departmental heads, so that the book forms a very excellent reference work, as well as a class-room and general reading volume. Flight-Commander McMinnies treats the subject in a very broad way and covers such points as—"which men make good pilots"; in this chapter he evidences a good grasp of the subject of applied psychology. As we pass along thru the elementary studies of the airplane and its component parts, we find the text and drawings so interesting, that it does not tire us at all.

Some very excellent diagrams and drawings are given, showing the various accidents in landing and how they occur, also how all the fancy "stunts" are performed progressively in the air. The sections treating on cross-country flying and the determination of altitude as well as orientation, are clearly written and treated on in a manner following that found most efficient by the Allied fliers on the Western front.

GENERAL LECTURES ON ELECTRICAL ENGINEERING, by Charles Proteus Steinmetz. Cloth covers, 242 pages, 50 illustrations, size 6¼ x 9½ inches. Price $2.50. Publisht by McGraw-Hill Book Company, Inc., New York, N. Y.

This volume contains some of the most interesting lectures given by Dr. Steinmetz, and forms a most valuable work which will find a welcome in the library of every engineer, electrical man and student. Dr. Steinmetz is a speaker and writer of articles which possess great expanse of viewpoint. When he speaks of the incandescent lamp, for instance, in lecture 16 of this series here presented, the reader will be surprised at the wide range of topics he discusses. Practically every important type of lamp and their relative operating efficiencies and characteristics are treated upon in this lecture, even down to the modern gas-filled Mazda tungsten lamp. The several other lectures, of which there are 18 in all, cover such interesting and important subjects as electrochemistry, the alternating current railway motor, electric railways, lightning protection, direct current regulation and control, hunting and synchronous machines, high frequency oscillations, surges and impulses, higher harmonics of the generator wave, long distance transmission, arc lighting, modern power generation, etc., etc.

STANDARD WIRING FOR ELECTRIC LIGHT AND POWER, by H. C. Cushing, Jr. Leather covers, 360 pages, profusely illustrated, size 6¼ x 4¼ inches. Price $1.50. Publisht by H. C. Cushing, Jr., 1918, New York, N. Y.

One of the most widely read and also one of the most clearly written and easily understood works available to electrical men in all branches of the industry. Mr. Cushing's manual has been useful for many years. Each year a new edition is brought out covering the latest changes in the Fire Underwriter's rules. The author follows the Underwriter's rules and describes with the aid of simple formulas, numerous tables, and special illustrations, the exact meaning of the various clauses in the wiring code, so that this book becomes very valuable to electricians, architects, superintendents and engineers. Some of the simplest tables and methods of using them for calculating both light and power distribution wiring ever given are included in this manual, and any electrical man can understand them easily. A number of diagrams of electric motor connections, including series, shunt and compound machines, are given as well as instructions for the proper installation of all such machinery. House wiring receives special attention all the way thru the work, and electrical wiremen will find this manual a most useful and authoritative companion. It settles all wiring disputes.

Learn Electricity

In the Great Shops of

COYNE

Trade and Engineering Schools
Dept. 22, 39-51 E. Illinois St., Chicago, Ill.

PRACTICAL INSTRUCTION

FINISH IN 3 MONTHS

Thousands of skilled Electricians are needed. The demand is becoming more urgent every day. The big Industries are employing every one they can get, causing a great scarcity of trained men, throughout the country. **Big salaries are being paid everywhere.** Right now is *your* big opportunity. Make up your mind now to prepare for one of these big jobs and then get here as quick as you can for your training.

Earn $150.00 to $450.00 A Month

In the Electrical business. Come here where you will be trained in these great $93,000 shops. Experts show you everything and you learn right on the actual apparatus. You work on everything from the simple bell to the mighty motors, generators, electric locomotives, dynamos, switchboards, power plants, everything to make you a master electrician. We have thousands of successful graduates. Just as soon as you have finished we assist you to a good position. We now have more positions than we can fill. Think of it.

PREPARE for a BIG PAYING POSITION

Peace demands thousands of trained electrical men NOW all industries are preparing for the greatest year in the Nation's History in 1919. This is the big opportunity for YOU. Will You grasp it?

These courses are thorough, short and practical. All instruction given on the actual equipment. No books or useless theory. Each man trained individually and stays as long as he likes. Start any time—day or evening.

Our graduates are in great demand. We are continually receiving letters, telegrams, and telephone calls from contractors, manufacturing firms, etc., seeking our graduates to fill responsible positions. We have now more positions than we can fill and the demand is steadily growing. Every comfort is given our students while here. They live in comfortable homes in the most beautiful section of Chicago—on the lake.

The War is Over—Yes!

but the men "over there" will not be back for months—perhaps years, for their work "over there" isn't over. And so you, and thousands more must fill up the gap now that the absence of these brave workers has made in the ranks of skilled labor. Trained Electricians are needed more, perhaps, than any other class of men. The sudden ending of the war has caused the big industries to start up work sooner than any of us expected and in consequence the Manufacturers are Calling for Trained Men, and we are training men as fast as we can to meet these urgent calls. You are needed, Young Man, now! Don't wait. Don't put it off. Get in touch with us Today. Get ready to join the great "Peace Army" here at home. Your country calls. Again we say, prepare to serve your country! We'll make a trained electrician of you in three months! Let's go!

LEARN DRAFTING

Skilled Draftsmen are always in demand. Our courses are thorough—short—practical, preparing a man fully to hold a position of responsibility. We have more positions than we can fill. We also have thorough practical courses in *Plumbing and Heating and Motion Picture Operating.*

EARN YOUR WAY

Many students earn a large part of their living expenses by doing a little work in their spare time. Our employment dept. furnishes these positions without charge.

Famous Scientific Illusions

(*Continued from page 694*)

The earliest trials were made by Dalibrand in France, but Franklin himself was the first to obtain a spark by using a kite, in June, 1752. When these atmospheric discharges manifest themselves today in our wireless station we feel annoyed and wish that they would stop, but to the man who discovered them they brought tears of joy.

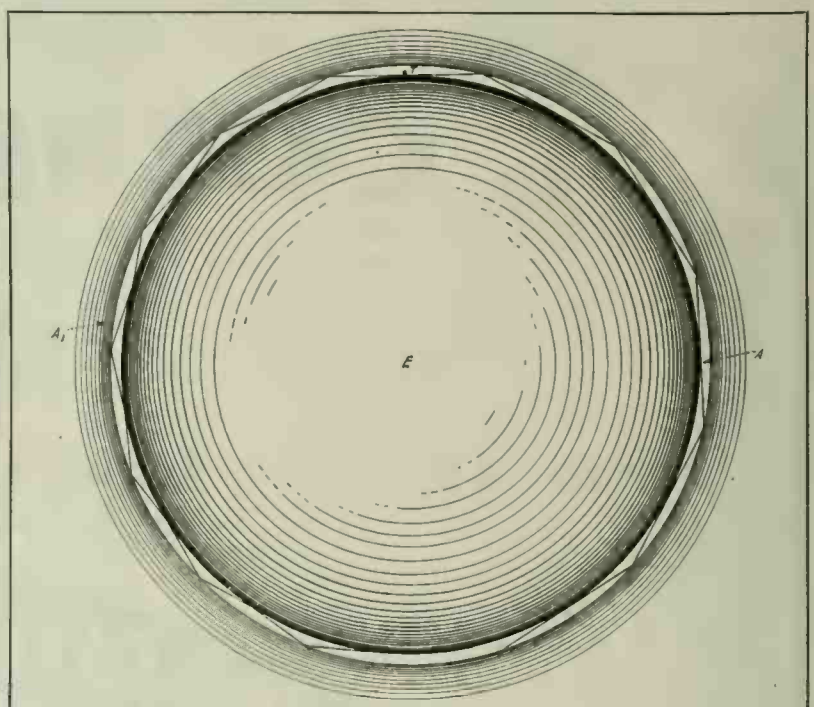

Fig. 7

The Theory Has Been Seriously Advanced and Taught that the Radio Ether Wave Oscillations Pass Around the Earth by Successive Reflections, as Here Shown. The Efficiency of Such a Reflector Cannot be more than 25 Per Cent; the Amount of Energy Recoverable in a 12,000-mile Transmission being but One Hundred and Fifteen Billionth Part of One Watt, with 1,000 Kilowatts at the Transmitter.

The lightning conductor in its classical form was invented by Benjamin Franklin in 1755 and immediately upon its adoption proved a success to a degree. As usual, however, its virtues were often exaggerated. So, for instance, it was seriously claimed that in the city of Piatermaritzburg (capital of Natal, South Africa) no lightning strokes occurred after the pointed rods were installed, altho the storms were as frequent as before. Experience has shown that just the opposite is true. A modern city like New York, presenting innumerable sharp points and projections in good contact with the earth, is struck much more often than equivalent area of land. Statistical records, carefully compiled and publisht from time to time, demonstrate that the danger from lightning to property and life has been reduced to a small percentage by Franklin's invention, but the damage by fire amounts, nevertheless, to several million dollars annually. It is astonishing that this device, which has been in universal use for more than one century and a half, should be found to involve a gross fallacy in design and construction which impairs its usefulness and may even render its employment hazardous under certain conditions.

For explanation of this curious fact I may first refer to Fig. 3, in which s is a metallic sphere of radius r, such as the capacity terminal of a static machine, provided with a sharply pointed pin of length h, as indicated. It is well known that the latter has the property of quickly dissipating the accumulated charge into the air. To examine this action in the light of present knowledge we may liken electric potential to temperature. Imagine that sphere s is heated to T degrees and that the pin or metal bar is a perfect conductor of heat so that its extreme end is at the same temperature T. Then if another sphere of larger radius, r_1, is drawn about the first and the temperature along this boundary is T_1, it is evident that there will be between the end of the bar and its surrounding a difference of temperature $T - T_1$, which will determine the outflow of heat. Obviously, if the adjacent medium was not affected by the hot sphere this temperature difference would be greater and more heat would be given off. Exactly so in the electric system. Let q be the quantity of the charge, then the sphere—and owing to its great conductivity also the pin—will be at the potential $\frac{q}{r}$. The medium around the point of the pin will be at the potential $\frac{q}{r_1} = \frac{q}{r+h}$ and, consequently, the difference $\frac{q}{r} - \frac{q}{r+h} = \frac{qh}{r(r+h)}$. Suppose now that a sphere S of much larger radius $R = nr$ is employed containing a charge Q this difference of potential will be, analogously $\frac{Qh}{R(R+h)}$. According to elementary principles of electro-statics the potentials of the two spheres s and S will be equal if $Q = nq$ in which case $\frac{Qh}{R(R+h)} =$

"Here's an Extra $50, Grace

—I'm making *real* money now!"

"Yes, I've been keeping it a secret until pay day came. I've been promoted with an increase of $50 a month. And the first extra money is yours. Just a little reward for urging me to study at home. The boss says my spare time training has made me a valuable man to the firm and there's more money coming soon. We're starting up easy street, Grace, thanks to you and the I. C. S.!"

Today more than ever before, money is what counts. The cost of living is mounting month by month. You can't get along on what you have been making. Somehow, you've simply got to increase your earnings.

Fortunately for you hundreds of thousands of other men have proved there is an unfailing way to do it. Train yourself for bigger work, learn to do some one thing well and employers will be glad to pay you real money for your special knowledge.

You can get the training that will prepare you for the position you want in the work you like best, whatever it may be. You can get it without sacrificing a day or a dollar from your present occupation. You can get it at home, in spare time, through the International Correspondence Schools.

It is the *business* of the I. C. S. to prepare men in just your circumstances for better positions at better pay. They have been doing it for 27 years. They have helped two million other men and women. They are training over 100,000 now. Every day many students write to tell of advancements and increased salaries already won.

You have the same chance they had. What are you going to do with it? Can you afford to let a single priceless hour pass without at least finding out what the I. C. S. can do for you? Here is all we ask—without cost, without obligating yourself in any way, simply mark and mail this coupon.

TEAR OUT HERE

INTERNATIONAL CORRESPONDENCE SCHOOLS

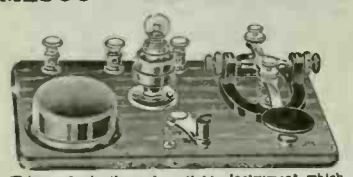
Mesco Telegraph Practice Set

For Learning Telegraph Codes

The Practice Set comprises a regular telegraph key, without circuit breaker, a special high pitch buzzer, one cell Red Seal Dry Battery, and four feet of green silk covered flexible cord.

The key and buzzer are mounted on a highly finished wood base, and three nickel plated binding posts are so connected that the set may be used for five different purposes.



List No. Price

342 Telegraph Practice Set, with Battery and Cord.....$3.24

Weighs 4 lbs. packed.

Price does not include postage.

MESCO Combination Practice Set for learning the Morse and Continental Visual and Audible Codes

This outfit is the only reliable instrument which will enable students to become proficient operators in the U. S. Naval Service, because it is equipped with a buzzer and miniature lamp enabling the user to master both the visual and audible signals quickly.

List No. 52—Practice Set with Red Seal Battery and Cord.....$4.05

Weighs 4 lbs. packed. Price does not include postage.

Send for the New Edition of Our Catalog W28

It is pocket size, contains 248 pages, with over 1,000 illustrations, and describes in plain, clear language all about Bells, Push Buttons, Batteries, Telephone and Telegraph Material, Electric Toys, Burglar and Fire Alarm Contrivances, Electric Call Bells, Electric Alarm Clocks, Medical Batteries, Motor Boat Horns, Electrically Heated Apparatus, Battery Connectors, Switches, Battery Gauges, Wireless Telegraph Instruments, Ignition Supplies, etc.

$\frac{nqh}{nr(nr+h)} = \frac{qh}{r(nr+h)}$. Thus the difference of potential between the point of the pin and the medium around the same

Fig. 4, Tesla Explains the Fallacy of the Franklin Pointed Lightning Rod, Here Illustrated, and Shows that Usually Such a Rod Could Not Draw Off the Electricity in a Single Cloud in Many Years. The Density of the Dots Indicates the Intensity of the Charges.

will be smaller in the ratio $\frac{r+h}{nr+h}$ when the large sphere is used. In many scientific tests and experiments this important observation has been disregarded with the result of causing serious errors. Its significance is that the behavior of the pointed rod entirely depends on the linear dimensions of the electrified body. Its quality to give off the charge may be entirely lost if the latter is very large. For this reason, all points or projections on the surface of a conductor of such vast dimensions as the earth would be quite ineffective were it not for other influences. These will be elucidated with reference to Fig. 4, in which our artist of the Impressionist school has emphasized Franklin's notion that his rod was drawing electricity from the clouds. If the earth were not surrounded by an atmosphere which is generally oppositely charged it would behave, despite all its irregularities of surface, like a polished sphere. But owing to the electrified masses of air and cloud the distribution is greatly modified. Thus in Fig. 4, the positive charge of the cloud induces in the earth an equivalent *opposite* charge, the density at the surface of the latter diminishing with the cube of the distance from the static center of the cloud. A brush discharge is then formed at the point of the rod and the action Franklin anticipated takes place. In addition, the surrounding air is ionized and rendered conducting and, eventually, a bolt may hit the building or some other object in the vicinity. The virtue of the pointed end to dissipate the charge, which was uppermost in Franklin's mind is, however, infinitesimal. *Careful measurements show that it would take many years before the electricity stored in a single cloud of moderate size would be drawn off or neutralized thru such a lightning conductor.* The grounded rod has the quality of rendering harmless most of the strokes it receives, tho occasionally the charge is diverted with damaging results. But, what is very important to note, it invites danger and hazard on account of the fallacy involved in its design. The sharp point which was thought advantageous and indispensable to its operation, is really a defect detracting considerably from the practical value of the device. I have produced a much improved form of lightning protector characterized by the employment of a terminal of considerable area and large radius of curvature which makes impossible undue density of the charge and ionization of the air.* *These protectors act as quasi-repellents and so far have never been struck tho exposed a long time.* Their safety is experimentally demonstrated to greatly exceed that invented by Franklin. By their use property worth millions of dollars which is now annually lost, can be saved.

III. The Singular Misconception of the Wireless.

To the popular mind this sensational advance conveys the impression of a single invention but in reality it is an art, the successful practise of which involves the employment of a great many discoveries and improvements. I viewed it as such when I undertook to solve wireless problems and it is due to this fact that my insight into its underlying principles was clear from their very inception.

In the course of development of my induction motors it became desirable to operate them at high speeds and for this purpose I constructed alternators of relatively

*Refer to the October, 1918, issue of this journal wherein Dr. Tesla's new form of non-pointed lightning rod was fully described and illustrated.

ELECTRICITY

Taught By A Practical Man

and in Your Home!

IT IS UP TO YOU

I am teaching electricity and drafting to many men, young and old, and ladies too, and wish to interest you sufficiently so you will send for my catalog which tells the whole story, as it is too much to tell here. It is up to you whether you look into the proposition, but if you are earnest in your desire to get into the electrical industry, or to become more proficient in this line, you will send for the catalog and you will not regret the time you give in doing so.

THE PURPOSE OF THE COURSE OF STUDY

I have been designing courses in electrical instruction and teaching electricity, off and on during the past 17 years, and during that time I have had an unusual opportunity to make a special study of the teaching business, from the standpoint of a practical man. This course of my own is designed with a view of reaching those who do not have a lot of time and money to devote to study work, and to give them as thorough a knowledge as possible of electricity, in the shortest possible time. The instruction is given like you were working on various jobs and I was the boss telling you what to do and how to do it, and giving the explanation necessary for the understanding of the theory covered by the subject under discussion. There are many conditions which seldom occur in the every day run of electrical experience, and these conditions I lay particular stress on. This part of the instruction makes the course particularly attractive and valuable to those already engaged in active electrical work.

FIFTY FIFTY

I work absolutely on a 50-50 basis with my students. You pay me the comparatively low price I ask, and I give you the instruction and other help as is stated in my catalog. No student is permitted to pay cash for his entire course on starting, the course being paid for in small monthly payments as you go along. Students have the privilege of discontinuing the work if they should find that it was not just what they were after, and their payments stop at the same time. This is my way of doing business and I would not want your money when I was not giving you the instruction.

Apparatus, Instruments, Material, Etc.

Certain electrical apparatus, instruments, material, charts, drafting implements, etc., as detailed in the catalog, are included in the course and are a part of the regular instruction for which there is no extra charge as it is covered by the regular monthly payments.

YORKE BURGESS,
BURGESS ELECTRICAL SCHOOL,
745 East 42nd Street, Chicago, Illinois.

Gentlemen:—
Send me catalog describing your course in Electricity and Drafting.

NAME .....
ADDRESS .....
CITY .....
STATE .....

To Practical Men and Electrical Students:

(See review of this book by Editor in December issue of your Electrical Experimenter, page 568)

I have prepared a pocket-size note book especially for the practical man and those who are taking up the study of electricity. It contains drawings and diagrams of electrical machinery and connections, over two hundred formulas for calculations, and problems worked out showing how the formulas are used. This data is taken from my personal note book, which was made while on different kinds of work, and I am sure it will be found of value to anyone engaged in the electrical business.

The drawings of connections for electrical apparatus include Motor Starters and Starting Boxes, Overload and Underload Release Boxes, Reversable Types, Elevator Controllers, Tank Controllers, Starters for Printing Press Motors, Automatic Controllers, Variable Field Type, Controllers for Mine Locomotives, Street Car Controllers, Connections for reversing Switches, Motor and Dynamo Rules and Rules for Speed Regulation. Also, Connections for Induction Motors and Starters, Delta and Star Connections and Connections for Auto Transformers, and Transformers for Lighting and Power Purposes. The drawings also show all kinds of lighting circuits, including special controls where Three and Four Way Switches are used.

The work on Calculations consist of Simple Electrical Mathematics, Electrical Units, Electrical Connections, Calculating Unknown Resistances, Calculation of Current in Branches of Parallel Circuits, How to Figure Weight of Wire, Wire Gauge Rules, Ohm's Law, Watt's Law, Information regarding Wire used for Electrical Purposes, Wire Calculations, Wiring Calculations, Illumination Calculations, Shunt Instruments and How to Calculate Resistance of Shunts, Power Calculations, Efficiency Calculations, Measuring Unknown Resistances, Dynamo and Dynamo Troubles, Motors and Motor Troubles, and Calculating Size of Pulleys.

Also Alternating Current Calculations in finding Impedance, Reactance, Inductance, Frequency, Alternations, Speed of Alternators and Motors, Number of Poles in Alternators or Motors, Conductance, Susceptance, Admittance, Angle of Lag and Power Factor, and formulas for use with Line Transformers.

The book called the "Burgess Blue Book" is published and sold by the Burgess Engineering Company for one dollar ($1.00) per copy, postpaid. If you wish one of the books, send me your order with a dollar bill, check or money order. I know the value of the book and can guarantee its satisfaction to you by returning your money if you decide not to keep it after having had it for five days.

FAMOUS SCIENTIFIC ILLUSIONS

(*Continued from page 730*)

high frequencies. The striking behavior of the currents soon captivated my attention and in 1889 I started a systematic investigation of their properties and the possibilities of practical application. The first gratifying result of my efforts in this direction was the transmission of electrical energy thru *one wire* without return, of which I gave demonstrations in my lectures and addresses before several scientific bodies here and abroad in 1891 and 1892. During that period, while working with my oscillation transformers and dynamos of frequencies up to 200,000 cycles per second, the idea gradually took hold of me that the earth might be used in place of the wire, thus dispensing with artificial conductors altogether. The immensity of the globe seemed an unsurmountable obstacle but after a prolonged study of the subject I became satisfied that the undertaking was rational, and in my lectures before the Franklin Institute and National Electric Light Association early in 1893 I gave the outline of the system I had conceived. In the latter part of that year, at the Chicago World's Fair, I had the good fortune of meeting Prof. Helmholtz to whom I explained my plan, illustrating it with experiments. On that occasion I asked the celebrated physicist for an expression of opinion on the feasibility of the scheme. He stated unhesitatingly that it was practicable, provided I could perfect apparatus capable of putting it into effect but this, he anticipated, would be extremely difficult to accomplish.

I resumed the work very much encouraged and from that date to 1896 advanced slowly but steadily, making a number of improvements the chief of which was my system of *concatenated tuned circuits* and method of regulation, now universally adopted. In the summer of 1897 Lord Kelvin happened to pass thru New York and honored me by a visit to my laboratory where I entertained him with demonstrations in support of my wireless theory. He was fairly carried away with what he saw but, nevertheless, condemned my project in emphatic terms, qualifying it as something impossible, "an illusion and a snare." I had expected his approval and was pained and surprised. But the next day he returned and gave me a better opportunity for explanation of the advances I had made and of the true principles underlying the system I had evolved. Suddenly he remarked with evident astonishment: "Then you are not making use of Hertz waves?" "Certainly not," I replied, "*these are radiations.* No energy could be economically transmitted to a distance by any such agency. In my system the process is one of *true conduction* which, theoretically, can be effected at the greatest distance without appreciable loss." I can never forget the magic change that came over the illustrious philosopher the moment he freed himself from that erroneous impression. The skeptic who would not believe was suddenly transformed into the warmest of supporters. He parted from me not only thoroly convinced of the scientific soundness of the idea but strongly exprest his confidence in its success. In my exposition to him I resorted to the following mechanical analogues of my own and the Hertz wave system.

Imagine the earth to be a bag of rubber filled with water, a small quantity of which is periodically forced in and out of the same by means of a reciprocating pump, as illustrated. If the strokes of the latter are effected in intervals of more than one hour and forty-eight minutes, sufficient for the transmission of the impulse thru the whole mass, the entire bag will expand and contract and corresponding movements will be imparted to pressure gauges or movable pistons with the same intensity, irrespective of distance. By working the pump faster, shorter waves will be produced which, on reaching the opposite end of the bag, may be reflected and give rise to stationary nodes and loops, but in any case, the fluid being incompressible, its inclosure perfectly elastic, and the frequency of oscillations not very high, the energy will be economically transmitted and very little power consumed so long as no work is done in the receivers. This is a crude but correct representation of my wireless system in which, however, I resort to various refinements. Thus, for instance, the pump is made part of a resonant system of great inertia, enormously magnifying the force of the imprest impulses. The receiving devices are similarly conditioned and in this manner the amount of energy collected in them vastly increased.

The Hertz wave system is in many respects the very opposite of this. To explain it by analogy, the piston of the pump is assumed to vibrate to and fro at a terrific rate and the orifice thru which the fluid passes in and out of the cylinder is reduced to a small hole. There is scarcely any movement of the fluid and almost the whole work performed results in the production of radiant heat, of which an infinitesimal part is recovered in a remote locality. However incredible, it is true that

Wireless Stations Will Shortly Re-open

Date, only, uncertain

Heed Our Advice ***ORDER NOW***

As a matter of law Congress loses all control over wireless receiving stations and transmitting stations with a range within the borders of the state where located as soon as peace is declared. The Radio Inspector of this district has already asked our co-operation in printing in the next edition of our catalog the necessity of securing licenses for transmitting sets with a range beyond the borders of the state. No wireless manufacturer wants the stations to open tomorrow. They could not take care of the business. Order now and be prepared. We have a big stock of wireless instruments.

No. 11 is our latest catalog. No new price list.

Please do not write for catalog if you have No. 11. Paper costs three times as much as formerly. Let the amateur without a catalog secure one. Write for prices in advance. Just now we have no price list, because the changes have been so frequent. Will advise through this magazine when revised price list is ready, which will be as quickly as possible.

Send 8c in coin or stamps today for our big 300 page No. 11 Electrical and Wireless Catalog. Any wireless amateur will tell you it is the one catalog to have. You need no others. Our catalog contains most everything in wireless worth while, and is a guarantee that the goods are dependable.

the minds of some of the ablest experts have been from the beginning, and still are, obsest by this monstrous idea, and so it comes that the true wireless art, to which I laid the foundation in 1893, has been retarded in its development for twenty years. This is the reason why the "statics" have proved unconquerable, why the wireless shares are of little value and why the Government has been compelled to interfere.

We are living on a planet of well-nigh inconceivable dimensions, surrounded by a layer of insulating air above which is a rarefied and conducting atmosphere (Fig. 5). This is providential, for if all the air were conducting the transmission of electrical energy thru the natural media would be impossible. My early experiments have shown that currents of high frequency and great tension readily pass thru an atmosphere but moderately rarefied, so that the insulating stratum is reduced to a small thickness as will be evident by inspection of Fig. 6, in which a part of the earth and its gaseous envelope is shown to scale. If the radius of the sphere is 12½", then the non-conducting layer is only 1/64" thick and it will be obvious that the Hertzian rays cannot traverse so thin a crack between two conducting surfaces for any considerable distance, without being absorbed. The theory has been seriously advanced that these radiations pass around the globe by *successive reflections*, but to show the absurdity of this suggestion reference is made to Fig. 7 in which this process is diagrammatically indicated. Assuming that there is no refraction, the rays, as shown on the right, would travel along the sides of a polygon drawn around the solid, and inscribed into the conducting gaseous boundary in which case the length of the side would be about 400 miles. As one-half the circumference of the earth is approximately 12,000 miles long there will be, roughly, thirty deviations. The efficiency of such a reflector cannot be more than 25 per cent, so that if none of the energy of the transmitter were lost in other ways, the part recovered would be measured by the fraction $(¼)^{30}$. Let the transmitter radiate Hertz waves at the rate of 1,000 kilowatts. Then about *one hundred and fifteen billionth part of one watt* is all that would be collected in a *perfect* receiver. In truth, the reflections would be much more numerous as shown on the left of the figure, and owing to this and other reasons, on which it is unnecessary to dwell, the amount recovered would be a vanishing quantity.

Consider now the process taking place in the transmission by the instrumentalities and methods of my invention. For this purpose attention is called to Fig. 8, which gives an idea of the mode of propagation of the current waves and is largely self-explanatory. The drawing represents a solar eclipse with the shadow of the moon just touching the surface of the earth at a point where the transmitter is located. As the shadow moves downward it will spread over the earth's surface, first with infinite and then gradually diminishing velocity until at a distance of about 6,000 miles it will attain its true speed in space. From there on it will proceed with increasing velocity, reaching infinite value at the opposite point of the globe. It hardly need be stated that this is merely an illustration and not an accurate representation in the astronomical sense.

The exact law will be readily understood by reference to Fig. 9, in which a transmitting circuit is shown connected to earth and to an antenna. The transmitter being in action, two effects are produced: Hertz waves pass thru the air, and a current traverses the earth. The former propagate with the speed of light and their energy is *unrecoverable* in the circuit. The latter proceeds with the speed varying as the cosecant of the angle which a radius drawn from any point under consideration forms

Increase Your Will Power In One Hour

Author of This Article Tells How He Quickly Acquired a Dominating Will Power That Earns Him Between $50,000 *and* $70,000 *a Year*

FOUR YEARS ago a man offered me a wonderful bargain. He was hard up for money and wanted to sell me some shares in a young, growing company for $1,000. Based on the earnings of the Company the stock offered me was easily worth $5,000—in fact, the man who finally bought the shares sold them again in five months at a profit of $4,300.

The reason I didn't buy the shares was that I could no more raise a thousand dollars than I could hop, skip, and jump across the Atlantic Ocean. A thousand dollars! And my income only twenty-five a week.

The second chapter in my life began a few months later, when another opportunity came to me. It required an investment of $20,000 during the first year. I raised the money easily, paid back every penny I borrowed, and had $30,000 left at the end of the first year! To date, in less than four years, my business has paid me a clear profit of over $200,000 and is now earning between $50,000 and $70,000 a year. **Yet for twelve years before, the company had been losing money every year!**

The natural question for my reader to ask is, "How could you borrow $20,000 to invest in a business which had previously been a failure, after being unable to borrow $1,000 for an investment that seemed secure?" It is a fair question. And the answer can be given in two little words— **WILL POWER.**

When the first proposition came to me I passed it by simply because I didn't have the money and couldn't borrow it. I went from one friend to the next and all turned me down. Several refused to talk business with me at all. They all liked me personally, and they asked me about the kiddies, but when it came to money matters I hadn't a chance. I was scared stiff every time I talked to one of them. I pleaded with them, almost begged them. But everybody had their "money all tied up in other investments." It was an old excuse, but I accepted it meekly. I called it hard luck. But I know today that it was nothing in the world except my lack of Will Power, or rather my weak Will Power, which kept me from getting what I wanted.

When I heard that the man sold those shares at a profit of $4,300, it seemed that my sorrow could not be greater. That profit was just about what my salary amounted to for four years! But instead of grieving over my "hard luck," I decided to find out why I was so easily beaten in everything I tried to accomplish. It must be that there was something vital that made the difference between success and failure. It wasn't lack of education, for many illiterate men become wealthy. What was this vital spark? What was this one thing which successful men had and which I did not have?

Partial List of Contents

The Law of Great Thinking
The Four Factors on which it depends.
How to develop analytical power.
How to think "all around" any subject.

Seven Principles of drill in Mental, Physical, Personal power
FIFTY-ONE MAXIMS for Applied Power of Perception. Memory, Imagination, Self-Analysis, Control.
How to develop a strong, keen gaze.
How to concentrate the eye upon what is before you—object, person, printed page, work.
These are only a few of the many subjects treated.

I began to read books about psychology and mental power. But everything I read was too general. There was nothing definite—nothing that told me **what to do.**

After several months of discouraging effort, I finally encountered a book called "Power of Will," by Prof. Frank Channing Haddock. The very title came to me as a shock. When I opened the book I was amazed. I realized that will power was the vital spark—the one thing that I lacked. And here in this book were the very rules, lessons and exercises through which anyone could increase their will power. Eagerly I read page after page; including such articles as, The Law of Great Thinking; How to Develop Analytical Power; How to Concentrate Perfectly; How to Guard Against Errors in Thought; How to Develop Fearlessness; How to Acquire a Dominating Personality.

An hour after I opened the book I felt like a new person. My sluggish will power was beginning to awaken. There was a new light in my eye, a new spring in my step, a new determination in my soul. I began to see, in my past, the many mistakes I had made, and I knew I would never make them again.

I practiced some of the simple exercises. They were more fascinating than any game of cards or any sport.

Then came an opportunity to acquire the business which had lost money for twelve years, and which I turned into a $50,000 a year money maker. Instead of cringing before the moneyed people, I won them over by my sheer force of will. I would not be denied. And my every act and word since then has been the result of my training in will power.

I am convinced that every man has within himself every essential quality of success except a strong will. Any man who doubts that statement need only analyze the successful men he knows, and he will find himself their equal, or their superior, in every way except in will power. Without a strong will, education counts for little, money counts for nothing, opportunities are useless.

I earnestly recommend Prof. Haddock's great work, "Power of Will," to those who feel that success is just out of reach—to those who lack that something which they cannot define, yet which holds them down to the grind of a small salary.

Never before have business men and women needed this help so badly as in these trying times. Hundreds of real and imaginary obstacles confront us every day, and only those who are masters of themselves and who hold their heads up will succeed. "Power of Will" as never before is an absolute necessity—an investment in self-culture which no one can afford to deny himself.

I am authorized to say that any reader who cares to examine "Power of Will" for five days may do so without sending any money in advance. If after one hour you do not feel that your will power has increased, and if after a week's reading you do not feel that this great book supplies that one faculty you need most to win success, return it and you will owe nothing. Otherwise send only $3, the small sum asked.

Some few doubters will scoff at the idea of will power being the fountainhead of wealth, position and everything we are striving for, but the great mass of intelligent men and women will at least investigate for themselves by sending for the book at the publisher's risk. I am sure that any book that has done for me—and for thousands of others—what "Power of Will" has done—is well worth investigating. It is interesting to note that among the 250,000 owners of "Power of Will" are such prominent men as Supreme Court Justice Parker; Wu Ting Fang, Ex-U. S. Chinese Ambassador; Gov. McKelvie, of Nebraska; Assistant Potmaster-General Britt; General Manager Christeson, of Wells-Fargo Express Co.; E. St. Elmo Lewis; Senator Arthur Capper of Kansas and thousands of others. In fact, today "Power of Will" is just as important, and as necessary to a man's or woman's equipment for success, as a dictionary. To try to succeed without Power of Will is like trying to do business without a telephone.

As your first step in will training, I suggest immediate action in this matter before you. It is not even necessary to write a letter. Use the form below, if you prefer, addressing it to the Pelton Publishing Company, 30-B Wilcox Block, Meriden, Conn., and the book will come by return mail. You hold in your hand, this very minute, the beginning of a new era in your life. Over a million dollars has been paid for "Power of Will" by people who sent for it on free examination. Can you, in justice to yourself, hesitate about sending in the coupon? Can you doubt, blindly, when you can see, without a penny deposit, this wonder-book that will increase your will power in one hour.

The cost of paper, printing and binding has almost doubled during the past three years, in spite of which "Power of Will" has not been increased in price. The publisher feels that so great a work should be kept as low-priced as possible, but in view of the enormous increase in the cost of every manufacturing item, the present edition will be the last sold at the present price. The next edition will cost more. I urge you to send in the coupon now.

PELTON PUBLISHING COMPANY
30-B Wilcox Block, Meriden, Conn.

I will examine a copy of "Power of Will," at your risk I agree to remit $3 or remail book in 5 days.

MOTORS

We have 1000 NEW WASHING MACHINE MOTORS. These are of standard manufacture and carry the regular factory guarantee. Shipped in original boxes. Complete as cut.

Bought from Bankruptcy Stock

Suitable for operating Coffee Grinders, Cream Seperators, Bottle Washers, Air Compressors, Small Lathes, Etc.

Mail $8.00 cash or Money Order. We will send C.O.D. subject to full examination. MONEY BACK GUARANTEE

$18.50 EACH

Special Quantity Prices Regular Value $34

MANUFACTURERS' DISTRIBUTER

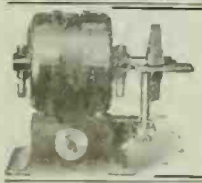
CHAS. H. JOHNSTON - West End - Pittsburgh, Pa.

BARGAINS in Small Motors and Generators. Write for Catalogue

Wireless Taught By Mail

Merchant Marine Needs THOUSANDS of Operators

Men also needed for big Land Wireless Stations—Aerial Mail Service—Railroad and Telegraph companies. Salaries up to $200 a month. Excellent opportunities to win promotion to Radio Engineer—Inspector—or Draftsman. Chance to travel the world over or locate at Land Station in America.



Complete Course by Mail in Ten Weeks

Our students actually pass the commercial examination in Ten Weeks or less. Start studying NOW in spare time at home. We send you Complete Set Practice Instruments for receiving and sending messages, with first lessons. We help you secure position in any branch of Commercial or Government Radio Service. Write TODAY for Free Particulars. A postal will do.

NATIONAL RADIO INSTITUTE

Grinding and Buffing Motors

An indispensable tool in any shop or laboratory. Your equipment is not complete without a BODINE grinding and buffing motor.

Save time and money by keeping your lathe tools, milling cutters and drills sharp.

Send for bulletin No. 522 giving full details of this handy machine.

BODINE ELECTRIC COMPANY. 2254 W. Ohio St., Chicago.

with the axis of symmetry of the waves. At the origin the speed is infinite but gradually diminishes until a quadrant is traversed, when the velocity is that of light. From there on it again increases, becoming infinite at the antipole. Theoretically the energy of this current is *recoverable* in its entirety, in properly attuned receivers.

Some experts, whom I have credited with better knowledge, have for years contended that my proposals to transmit power without wires are sheer nonsense but I note that they are growing more cautious every day. The latest objection to my system is found in the cheapness of gasoline. These men labor under the impression that the energy flows in all directions and that, therefore, only a minute amount can be recovered in any individual receiver. But this is far from being so. The power is conveyed in only one direction, from the transmitter to the receiver, and none of it is lost elsewhere. It is perfectly practicable to recover at any point of the globe energy enough for driving an airplane, or a pleasure boat or for lighting a dwelling. I am especially sanguine in regard to the lighting of isolated places and believe that a more economical and convenient method can hardly be devised. The future will show whether my foresight is as accurate now as it has proved heretofore.

SHIP RADIO OPERATORS ASK INCREASED WAGES.

Increased wages and the fixing of a standard wage scale for radio operators on vessels operating under Government direction was asked of the Shipping Board recently by a delegation representing the Marconi Radio Telegraphers' Association. The radio operators included in the request made of the Board are those on vessels operating in transatlantic and Gulf waters. Assurances were given the radio representatives by Board officials that their request would be taken under advisement for immediate consideration.

SKINDERVIKEN TRANSMITTER BUTTON

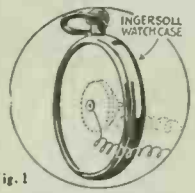

Fig. 1

Fig. 2

THE SKINDERVIKEN TRANSMITTER BUTTON presents the latest advance in microphones and marks a revolution in transmitter construction. It works on an entirely new principle, takes up practically no room, and marks the end of all telephone transmitter troubles.

The SKINDERVIKEN TRANSMITTER BUTTON can be placed in any position and it will talk loudly and distinctly and is at the same time extraordinarily sensitive. It was primarily designed to replace the old damaged or burnt out transmitter. Simply unscrew and remove the telephone transmitter front, disconnect the two inside wires, unscrew and remove the bridge and the old electrode. There remains only the diafram. These wires are then connected with the Skinderviken button, the latter screwed to the diafram, and after screwing the old transmitter housing together again, the telephone is ready for work.

ELECTRICAL EXPERIMENTER readers will be particularly interested in all the different experiments that can be performed with the Skinderviken Button. Fig. 1 shows the Skinderviken button attached to the back of an Ingersol watch case. When speaking towards the inside of the case, it will be found that the voice is reproduced clearly and loudly Fig. 2 shows another interesting stunt. By attaching the buttoo to a tin diafram about the size of half a dollar, and by holding the diafram at the side of the throat, as shown, speech can be transmitted with surprising clarity. Fig. 3 illustrates the same arrangement placed on the chest as shown. In this position the transmitter will talk clearly and loudly. Fig. 4 shows an arrangement whereby the Skinderviken button is attached on a thin wood board at the preacher's pulpit. His voice is clearly transmitted so that people hard of hearing can readily hear the sermon. Fig. 5 shows an interesting stunt, whereby a hole is drilled in the side of a thin glass water-tumbler; the sides of the glass thus acting as a diafram, the voice is clearly transmitted. Fig. 6 shows a simple match box Detectophone. The Skinderviken button is concealed inside of the box, only the small brass nut showing on the outside. This can be camouflaged as well. This device talks well. Fig. 7 shows how to transmit phonograph music at a distance merely by drilling a small hole in the phonograph arm and attaching the Skinderviken button; a very favorite experiment with all experimenters. Fig. 8 shows how a very sensitive Detectophone can be made by placing one of the buttons in the center of a lithographed cardboard picture, so that only the small brass nut shows. The large surface of the picture acts as a big diafram, and the voice is well reproduced.

$1.00 prepaid

We have such unlimited confidence in the Skinderviken transmitter button that we make the following remarkable offer. Send us one dollar ($1.00) for which we will mail one button prepaid. If you do not wish to keep it, return it within five days and your money will be refunded. Boys! send stamp for booklet No. 4. It gives diagrams and experiments using the Skinderviken Transmitter Button, and prices of telephone equipment.

ALEXANDER WIRELESS BILL, AMENDED.

(Continued from page 707)

"Seventh. It shall be lawful for the Government to deputize owners of private or amateur stations at a nominal fee for the purpose of having the radio rules and regulations enforced in such localities as the number of stations so warrants such a proceeding.	No fundamental objection to this phase. It was already done in a silent way by tacit agreement among the amateurs before the war. It was very common for the Editor of this as well as other publications to receive letters from amateurs complaining of fellow amateurs who had infracted the law. A letter to such violators from the various publications devoted to wireless usually brought speedy redress. Apparently no law was necessary.
"Eighth. The Government shall have the right to permanently revoke any license held by a private or amateur station as an extreme penalty for disobeyance of the radio rules and regulations set forth by this Act and any previous Acts concerning radio telegraphy.	We have no objection against this either. An amateur should have his license revoked if he does not play the game fair. In the five years that the 1912 Radio Act was in effect, however, we have not heard of a single case where a license was revoked.
"Ninth. It shall be lawful for the Government to provide technical schools and State universities with radio stations for the benefit of science and the training of radio operators.	No objection to this.
"Tenth. It shall be lawful for the Government to require all private or amateur stations to use inductive coupling between the antenna circuit and the circuit which includes the power transformer for damped radiotelegraphic communication.	No objection.
"Eleventh. It shall be unlawful for any private or amateur station to use a spark coil operating on direct current for the sending of radio disturbances into the ether.	We fail to see the wisdom of this. An amateur with a spark coil, we admit, can cause a lot of disturbance, but it should be remembered that a Government or commercial station can readily tune out such an amateur station without any trouble whatsoever even if it operates a block away. Furthermore, if no spark coils could be used, the amateur would naturall resort to a transformer, and there is no such apparatus made today which uses less than 100 watts. Most of the spark coils use less than 30 or 40 watts, consequently send out less disturbance than would be the case under the new measure.
"Twelfth. It shall be unlawful, except by special license, for any private or amateur station to use more than one hundred and twenty-five watts as measured in the antenna circuit, for the sending of radiotelephonic communications.	We believe that 125 watts is not sufficient. In a few years there will be thousands of radio telephone stations operating all over the country, and they will be as common as the telephone is today. Ours is a country of vast distances. This law would work especial harm to our western states where there are often no settlements a hundred miles apart. One hundred and twenty-five watts as measured in the antenna circuit we believe is insufficient to bridge such distances. We believe 250 watts should be the minimum.
"Thirteenth. The Government shall have the right to suspend the sending of radio disturbances into the ether by private or amateur stations for definite periods of the night or day in such zones as may become necessary, but nothing in this article shall be construed to mean that the sending of private or amateur stations shall be permanently suspended.	Yes, every bill must have its usual joker, and it is right here. If this clause becomes a law then any officious Government operator can take it into his head to prohibit sending in his district between the hours of 4 P. M. and 12 A. M. This period would be considered night. You said it, "GOOD Night." It would, of course, blot out all the sending stations with one stroke. If we must have a time limit, let it be stated in the law so there will not be any "ifs" and "buts"—at best such a clause as this would tend to create eternal friction between amateurs and Government officials. We believe such a clause is unjust and only at best reflects on poor and inadequate Government apparatus and still more inefficient Government radio operators.
"Fourteenth. The owner of the license of any private or amateur station must display in his station a copy of the rules and regulations of the Government regarding radio stations and failure to do so shall be punishable by a fine not exceeding $100, such rules and regulations to be furnished by the Government at a nominal cost."	No objection to this, altho every amateur operator before the war was only too proud to display his Government license once he had gone thru the trouble to get one.

RADIO AMATEURS DISCUST OFFICIALLY.

During the hearings of the Alexander Bill, H. R. 13159, before the committee on the Merchant Marine and Fisheries on December 12, 1918, many interesting points were brought out.

Lieut. J. C. Cooper, Jr., U. S. N. R. F., had been intrusted with drafting the amateur amendment, printed elsewhere in this issue. Lieutenant Cooper, who calls himself an "amateur naval officer", undertook the thankless job of drafting an amendment which would satisfy both the Navy and amateurs. In fairness to Lieutenant Cooper, let us state that he tried hard to be fair to both interests. But it is our opinion that neither Navy Department nor Amateurs are fully satisfied with the compromise amendment.

Lieutenant Cooper's statement before the committee follows:

Statement of Lieut. J. C. Cooper, Jr., United States Naval Reserve Force.

Lieut. Cooper: Gentlemen, I am an ex-amateur radio operator and "amateur naval officer," as I am soon going back to civil life to take up the practise of my profession again. As many other amateurs, when the war broke out, I offered to do what I could for the service, and have had some duties in connection with radio work which have given me an opportunity, I hope, to be able to see the point of view of the Navy and the point of view of the amateur operator to some extent at the same time.

Several days ago there was a meeting called in Capt. Todd's office—without knowing how many men would be present—of all of the ex-amateurs who happened to be on duty in the naval service in Washington. There were about 25 or 30 men present. The question of the operation of amateur stations after the war was very liberally discust, and a memorandum was prepared and sent to each of those men and other men in the naval service in Washington who had been amateurs that we could locate, with the request that the questions be answered and sent back as soon as possible, with an idea of drafting an amendment to the present law which would, as far as possible, meet the combined view of themselves as previous amateurs, knowing amateur operations and knowing what the amateur desires to do and what he has done, and also with their experience since the war as part of the Government's service that has controlled radio. I had the unfortunate responsibility of having to say the final word on collating those opinions and putting them into the form of an amendment. There is no body of men, I believe, who disagree more violently among themselves on every subject that concerns them than do the amateur radio operators. I am convinced that from now on, as these hearings are going to be printed, my name is going down in radio history among the amateurs to some as guilty of high treason, to others as being foolish, to others as deserving some credit if this amendment goes into law. I do not expect all the amateurs to agree with it all. It is the collective judgment, however, of a certain number of amateurs who have seen both the Navy point of view and the amateur point of view, and I, myself, with the approval of the department, and it is offered as an amendment to the bill.

The present law states that the amateur who does not hold a special license is authorized within 5 miles of a Government station to use a transformer input of one-half kilowatt, elsewhere 1 kilowatt,

(Continued on page 737)

Learn Drafting

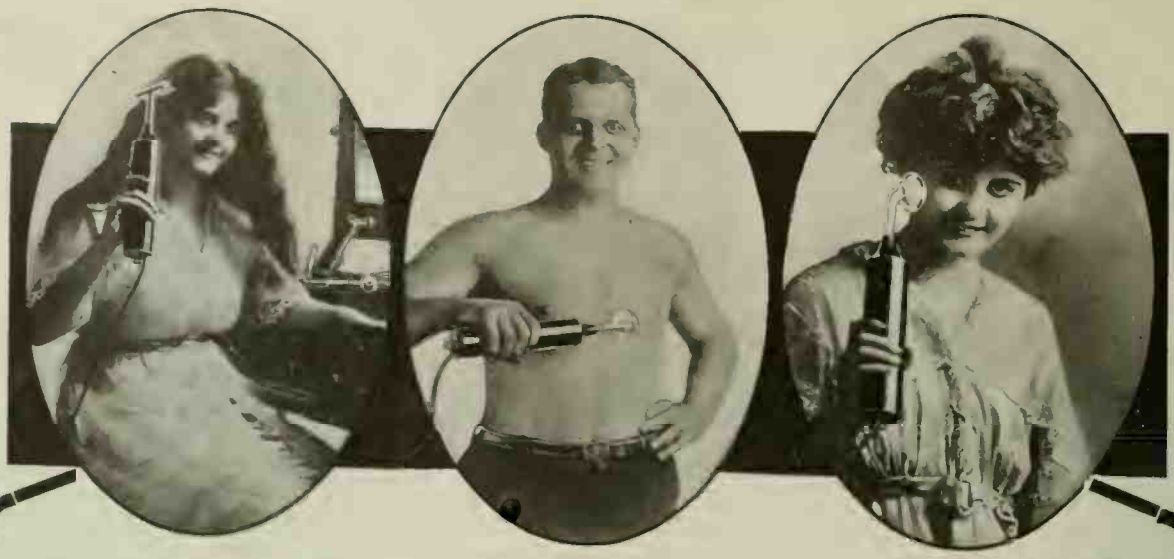
Employers everywhere are looking for skilled draftsmen. They are offering good salaries to start with splendid chances for advancement.

Drafting offers exceptional opportunities to a young man because drafting itself not only commands good pay, but it is the first step toward success in Mechanical or Structural Engineering or Architecture. And drafting is just the kind of work a boy likes to do. There is an easy delightful way in which you can learn right at home in spare time. For 27 years the International Correspondence Schools have been giving boys just the training they need for success in Drafting and more than 200 other subjects. Thousands of boys have stepped into good positions through I. C. S. help, but never were opportunities so great as now.

Let the I. C. S. help *you*. Choose the work you like best in the coupon, then mark and mail it. This doesn't obligate you in the least and will bring you information that may start you on a successful career. This is your chance. Don't let it slip by. Mark and mail this coupon now.

TEAR OUT HERE

INTERNATIONAL CORRESPONDENCE SCHOOLS
BOX 6175, SCRANTON, PA.



Explain, without obligating me, how I can qualify for the position, or in the subject, *before* which I mark X.

Try This Wonderful New

VIOLET-RAY

Machine—10 Days Free!

NOW in your own home you can have wonderful Violet-Ray treatments exactly as are given by eminent physicians and beauty specialists throughout the country. Now you can rid yourself of headaches, catarrh, constipation, eczema, insomnia, lumbago, nervousness. Relieve your pain from neuritis, rheumatism, and other disturbances. Multiply your bodily health, vitalize your nerves, double or treble your energy by using Violet-Rays. Sleep better, increase your strength, and improve your appetite and digestion. Soothe your nerves, reduce or increase your flesh. Tone and strengthen the entire system. Beautify your complexion! All with Violet Rays!

Not a Vibrator

The wonderful Violetta is not a Vibrator. It is not a machine that contracts the muscles—it does not shock, it does not pound the muscles—it is absolutely painless. Violet-Rays administered by the Violetta are wonderful even for infants! Relieve pain and suffering in every part of the body. Simple tests prove that Violet-Rays pass completely through every part of the body, stimulating every cell and organ. It is electricity in its highest remedial form.

Treat Yourself at Home

Here is a partial list of ailments treated successfully, with the Violetta, Violet-Ray Machine.

Asthma	Earache	Obesity
Barbers' Itch	Eczema	Pains
Boils	Eye Disease	Paralysis
Blackheads	Falling Hair	Piles
Bunions	Hay Fever	Pimples
Callous	Headache	Pyorrhea
Catarrh	Goitre	Rheumatism
Chilblains	Insomnia	Skin Diseases
Colds	Lumbago	Sore Throat
Corns	Nervousness	Sprains
Constipation	Neuralgia	Tonsilitis
Dandruff	Neuritis	Whooping Cough
Deafness		

What Physicians and Users Say

Trixie Friganza, well known actress says: "Cheerfully will I add my praise for Violetta. It's the best "pain chaser" and "soother" I've had the good fortune to find. It's WONDERFUL. It cured my brother of neuritis. As for myself I use it for facial treatments and general massage. I cannot say too much for it."

Dr. Bert H. Rice, of Vinton, Iowa, says: "I have good results with the Violetta High Frequency Instrument in all cases of neuralgia. Almost instant relief in Facial Neuralgia."

K. L. Allen, D. C., 205 Boone National Building, Boone, Iowa, says: "I have had very good results with the application of High Frequency Current in cases of Paralysis, Rheumatism and Neuritis, and think it a great help in drugless healing."

Dr. Daniels, Lisbon, North Dakota, says: "Have used the VIOLETTA in such cases as Goitre, Bronchitis, Pleurisy, Neuritis, Neuralgia, and Lumbago, and find it very beneficial. In fact, I would not be without it in my office."

Frank Borzone, Seattle, Wash., says: "I purchased the VIOLETTA for my wife who was suffering from an acute attack of Sciatica. From the very first treatment it induced peaceful rest and she is entirely well now."

www.americanradiohistory.com

RADIO AMATEURS DISCUST OFFICIALLY.

(Continued from page 735)

and to use a maximum wave length of 200 meters. All amateurs are agreed that you can not properly tune an efficient amateur station quite as low as 200 meters; that an extension in wave length is desirable. The consensus of opinion of those I have talked to is that the limitations of this amendment—that is, not to exceed 250 meters—will greatly increase the efficiency of amateur stations and will enable the amateur to further fulfill his real function, which is to train him as an operator for any national emergency that may arise, and to possibly train him as a further developer of the radio art. The amateur has no place in the scheme of things if he is not useful. The ether is a means of communication which must be put to the use of the community as a whole for the advancement of the community. Unless the amateur operator advances the art, or advances the community, the amateur has no right to exist. I, personally, as a naval officer, have had many operators under me. I have found that of the new men under me the easiest trained, the most adaptable to the new apparatus, and the most efficient men I had were ex-amateur operators.

I took two of my best men the other day and put them on the President's ship to receive official messages from Washington. They were both ex-amateur operators; and I think that I speak for Capt. Todd and the Navy when I say that no one more than the Navy realizes the value that the amateur operator was to the Navy when the war first broke out. I, personally, of course am prejudiced in favor of the amateur, because I am praising myself when I praise the amateur, because I am an amateur operator.

This amendment also licenses receiving stations without requiring a license of the operator. In other words, the jeweler who has a receiving station simply for the purpose of receiving the Arlington time signals and checking up his chronometer will not require to be a radio operator to operate his receiving station. Likewise, the amateur who is only learning to send, who is just starting, will not have to have any license in order to operate a receiving station.* We do not think, on the other hand, that any amateur ought to have a right to touch the key and to cause possible blundering interference by his lack of ability as an operator unless he can receive and send what is usually called 15 words per minute; that is, 75 letters per minute, in the ordinary standard of 5 letters to the word, which is what we use in averaging an operator's speed. I personally do not think that that limit is too high. Others may disagree with me. I personally think that no operator ought to touch a key and ought to be allowed to interefere with this medium of commerce, which is the ether, unless he has that degree of skill. If he is required to have that degree of skill, it will be an incentive to him when he is first learning the art to get up to that degree of skill as soon as he can, so that he can have a transmitting license.

This amendment includes a clause authorizing the Government, where it is found expedient—as, for instance, in large centers or elsewhere—to limit the transformer input of amateur stations to one-half kilowatt if within 100 miles of the seacoast or within 5 miles of a Government receiving station to one-fourth kilowatt. I am frank to say that those powers are higher than the consensus of opinion of these written documents from which I compiled the amendment. Those powers are more liberal than the great majority of the men who compiled these memorandums thought proper, but after talking with Capt. Todd and Commander Hooper, and with especially this idea in view, namely, that there are many amateur stations which will have to apply for license before they can again reopen, who, if the input is cut down very much from the present law, will be required to remodel a part of their apparatus or give up their apparatus if we change the power limits very much. Personally, I think that those limits are as reasonable as can be safe from the point of view of non-interference with the real business of radio, which is sending official and commercial dispatches, and that those powers are ample to provide full experimentation that an amateur ought to have occasion to do and all communication that he may have occasion to make. Mark me, it does not say that a license can not be issued up to 1 kilowatt under those limitations. It says that the Government may in its discretion put those limits on.

For example, we will take on the peninsula of Michigan or on parts of the more or less uninhabited coasts of the Gulf, there is no reason why there would be stations near enough or ships working near enough so that 1 kilowatt would necessarily cause interference by what we call "forced oscillation." The amendment leaves it in the discretion of the licensing power to cut down to those limitations amateur stations which are near the centers of commerce, where other stations are using radio for its real purpose, and still it allows the amateur to work.

There are a lot of amateur operators here, some of whom I have known personally; some I have met since I have been here to-day; some I have had correspondence with before the war. A lot of them are going to disagree with me; some of them are going to think these limitations too low and some are going to think these limitations too high. That will be for the committee to decide. This is submitted by the Navy as a measure to assist in the future development of amateur radio.

*The amendment, printed elsewhere, fails to show this.—EDITOR.

(Continued on page 738)

K. I. Shorthand hastened his promotion from stenographer to executive; now he depends upon it more than ever

You Need K.I. Shorthand Whatever Your Calling

The wonderful thing about K. I. Shorthand is the way it helps people in all walks of life. Engineers, chemists, contractors, clerks, mechanics, professional men and women, and farmers have learned K. I. Shorthand and are enthusiastic in its praise. At last you can learn shorthand so quickly and so inexpensively that it is worth your while.

This new, amazingly simple stenography will enable you to put down conversations rapidly as spoken, take messages verbatim, record board-meeting facts, jot down business-getting ideas, and stand ready to help you every time anything important must be written down fully and instantly. You do not have to study months to do this. Just five evenings at home is all that is necessary. Greater speed comes quickly with practice. Learn K. I. Shorthand because it will be the biggest little investment of your life.

You can learn in 5 evenings

K. I. Shorthand is the ideal system for stenographers or secretaries. You can prepare yourself for a position in weeks as compared to months by the old-fashioned systems—there is so much less to learn and remember. It is the most practical, concise and readable system in the world. Notes years old can be transcribed as readily as when fresh—just like longhand. Would you not give best satisfaction to your employer with a stenographic system that enables you to do that?

30 Days' Approval

Do not doubt for a minute that you can learn K. I. Shorthand in five evenings even though you may not know the first thing about stenography. It is not a bit remarkable for anyone to learn all the lessons in the system that quickly.

Why put in months of grinding study at some difficult old-fashioned system? Save time! Save money! Learn K. I. Shorthand, the new easy as A-B-C method of speed writing.

The cost of the course is lower than it has ever been possible to purchase a stenographic education. Everyone can afford it. K. I. Shorthand is used in government service and courts as well as public corporations and private businesses. Preferred for highly technical matter because of its remarkable accuracy and legibility.

Simplified K. I. Shorthand dispenses with all special positions, light and heavy shading and other confusing and speed-retarding rules of old systems. You will be delighted.

Try 2 Lessons FREE

You learn K. I. Shorthand in your own home by our mail tuition course. The lessons are fascinating. Experts guide you in quickly acquiring proficiency. Send for two free lessons and complete information. You may then continue the entire course on a month's approval.

"Go ahead! I'm getting it all in K. I. Shorthand"

Here is a complete course—not merely a text-book. Remember, there is no system to compare with K. I. Shorthand in brevity and practicability—and no course giving correspondence instruction obtainable at anything like our price.

We give you a positive guarantee that you can learn or no cost to you. King Institute is incorporated in New York State $100,000.00 authorized capital. Mail the coupon or write a letter asking for free lessons and complete information. Be sure to mention "Electrical Experimenter."

Used in Professions—"I am now past 83 and use K. I. Shorthand for my professional work in making records of cases. I like K. I. Shorthand System very much, indeed, and have recommended it to some who I think will enroll."
A. P. DAVIS, M.D.

In One Week!—"I learned K. I. Shorthand within five hours and in one week afterwards I was able to write 90 words per minute. I set down all my notes in K. I. Shorthand and can read them weeks afterwards. I believe that everybody should learn K. I. Shorthand as it is simple and also inexpensive. It is worth ten times what is asked for it. You have done everything you promised."
BYRON W. CREW.

A Pleasure to Learn—"It was a pleasure to learn K. I. Shorthand. Within three hours I could write any word. I can now write over 100 words per minute and am positive that by a little more practice I could speed up to 150 words a minute. It is easy to read one's notes in K. I. Shorthand."
(Miss) JOY WADSWORTH.

Professional Stenographer—"Until recently I knew absolutely nothing of shorthand. To-day I am holding a position as stenographer in the office of Inspector of Buildings where the terms apply almost wholly to building construction. I think this sufficient recommendation of your system."
(Mrs.) E. M. FULTON.

Used in Big Business—"I learned your system of shorthand to save time in making notes while passing about the plant. After only slight study I can take down ordinary conversations. K. I. Shorthand is practical, time-saving and simple."
S. B. ROPER

7 Electrical Money Makers Each 1¢ a Day!

It's Only a Step to the Big Jobs From Where You Are!

There is a big job waiting for you in the electrical profession. All you need is special training on advanced points which big men must know. And here is all this special knowledge which will enable you to master every electrical problem. This great 7-volume Cyclopedia of Applied Electricity bridges the gap between your present job and the $5,000 a year jobs.

50 Years of Electrical Experience Now at Your Finger Tips

Here in convenient form you will find everything from wiring a bell to the newest wireless discoveries. Tells all about elements of electricity—electrical measurements—underwriter's requirements—theory calculation, design and construction of generators and motors—dynamo-electric machinery—lighting machinery—power transmission—electric railways—power stations—switchboards and switching—storage batteries—applied electro-chemistry—electric elevators—electric welding and heating—wire and wireless telegraphy.

What the 7 Volumes Clearly Cover

Elements of Electricity—Electrical Measurements—Underwriter's Electrical Requirements — Theory, Calculation, Designs and Construction of Direct Current Generators and Motors — Types of Generators and Motors—Management of Electrical Machinery—Electric Lighting—Alternating Current Machinery—Power Transmission—Electric Railways—Self-Propelled Railway Cars—Trackless Trolleys—Power Stations—Switchboards and Switching—Storage Batteries—Applied Electro-Chemistry — Electric Elevators — Electric Welding and Heating—Wireless Telegraphy and Telephony — Land and Submarine Telegraphy.

Help You Fill These Jobs

Electrical Engineers, Substation Operators, Trouble Men, Switchboard Operators and Dynamo Tenders are wanted by light and power companies everywhere. The demand for their services exceeds the supply. Why not prepare yourself in your spare time—for a job paying up to $5,000 yearly? The Library of Electricity will give you the knowledge you need—in plain, everyday language.

Half Price—Easy Terms NO MONEY IN ADVANCE

Regular price $5.00 per volume. Special price less than $3.00 per volume. Easy terms only $2.00 a month—less than 1 cent a day per volume. Entire set shipped for free examination—no money in advance. Send no money. Just mail the coupon above.

MAIL COUPON NOW!

With each set we include a $12.00 Consulting Membership free. Advice of our experts for one year free. Don't be satisfied with a small job when the biggest jobs are open to trained men. Training is now offered you at a remarkable bargain. Mail coupon today without money.

Mr. Saunders: I want to ask you a few questions about the amateur. You have read the bill that is under consideration by the committee?

Lieut. Cooper: I have read it, sir.

Mr. Saunders: Aside from your amendment you have been discussing, there is no provision in the bill whatever relating to amateurs, is there?

Lieut. Cooper: I understand, sir, it was the intention of the department to license amateur operators.

Mr. Saunders: Under the bill that has been introduced there is no provision for the amateur?

Lieut. Cooper: Not under the name "amateur."

Mr. Saunders: Is there under any other name?

Lieut. Cooper: I think, sir, there would have been no reason why amateur stations should not have been licensed under the term "experimental stations."

Mr. Saunders: Suppose it is just a single individual. I understand a great many of these people who are amateurs took up this thing before the war—just young men who took up the business themselves?

Lieut. Cooper: I did so myself.

Mr. Saunders: That would not be called a station, would it?

Lieut. Cooper: Oh, yes, sir.

Mr. Saunders: Do you think, under the language "experimental stations," that any little individual amateur operator in the wilds of my district, I will say, who has been working on the thing himself as an intellectual improvement, could be described as "experimental station"?

Lieut. Cooper: I think so. But I say it is a moot point in view of the amendment.

Mr. Saunders: I do not see how that could be done with respect to the provision as to who is to be licensed as an amateur. Under that, necessarily, before any man could start out as an amateur, he must have had the opportunity to take some training at some school.

Lieut. Cooper: Very frankly I think that very few amateurs ever went to a training school.

Mr. Saunders: You require them to possess certain capacities by your amendment; they have got to have a certain facility.

Lieut. Cooper: The amateur can learn that by using the buzzer. All amateurs do the same thing, all operators.

Mr. Saunders: Can he experiment enough with the wireless apparatus to acquire that facility without having a trainer?

Lieut. Cooper: May I suggest, sir, that the process would be something like this: That by listening in, as we call it—and you will note that no license is required for receiving—a man can become accustomed to using the receiving apparatus, and he can become accustomed to the sending with a key hitched to a little buzzer, which is not a radio operator, and he can be taught to send up to any speed he can ever attain.

Mr. Saunders: He can teach himself, in other words, can he?

Lieut. Cooper: Teach himself, or be taught by other amateurs.

Mr. Saunders: He can pick that up by his own efforts, and by his own ingenuity and application at home and can acquire the facility which you have imposed upon him before he can receive a license?

Lieut. Cooper: I think any of the amateurs here will agree with me on that.

Mr. Saunders: With respect to this amateur, after he has attained that speed, and then is given the license that you contemplate, all of his operations would be controlled by the terms of his license?

Lieut. Cooper: They are at present, under the present law.

Mr. Saunders: Do you contemplate any difficulty in that connection if he operates according to the terms of his license, with the commercial operation of the Government system, or any other commercial system?

Lieut. Cooper: The limitation of wave lengths, sir, and the limitations of power in the present law of 1912, as amended by this amendment, are designed to prevent the amateur from causing interference with commercial stations.

Mr. Saunders: But you can see no danger of interference with the wireless system in the hands of private enterprise or Government control?

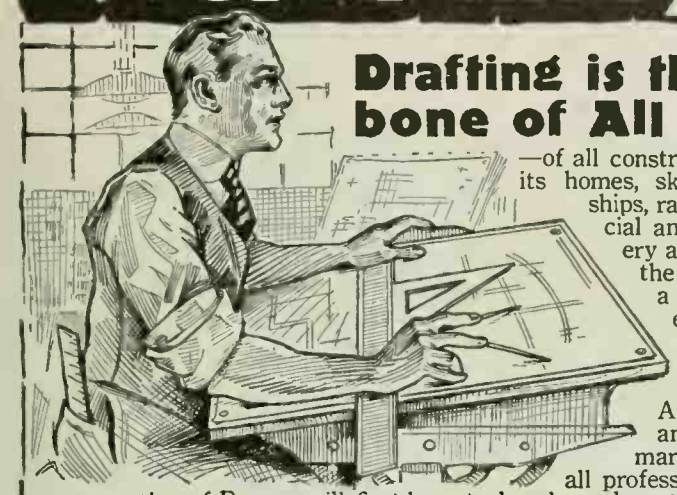
Lieut. Cooper: It was my view, sir, in drafting the amendment as it is, that these limitations on power and wave lengths would prevent such interference.

Mr. Saunders: So that in considering the general problem with respect to the necessity of having this entire business under Government ownership and control, we can eliminate any factor of danger from amateur operators?

Lieut. Cooper: I think so, sir, with the exception of the fact that adequate inspection of amateur stations must be had in the future if the amateur is to maintain the dignified position in the radio world that he should.

Mr. Saunders: That is by regulation?

Lieut. Cooper: Yes, sir.



Mr. Saunders: As I said, you eliminate the amateur experimentors as a factor in determining this policy, because they will operate in a field outside of the field that this policy is designed to control?

Lieut. Cooper: That is the idea of the amendment. There is one coming factor in radio work which may adversely affect amateur operating which should be looked forward to at the present time. The fleet—and this is not disclosing military secrets—is using for intercommunicating purposes very short wave length, shorter than the one hundred fifty meters mentioned here as the minimum length that an amateur should use. Aircraft are also using various wave lengths, some of which are almost

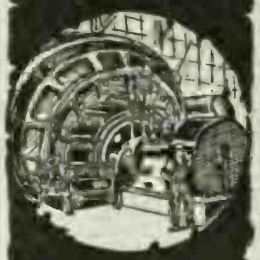
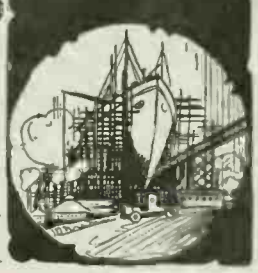
What Drafting Means to the World-and You



Drafting is the Backbone of All Industry

—of all construction. The world—its homes, skyscrapers, factories, ships, railroads, and commercial and industrial machinery are all monuments to the draftsman's skill. As a profession—as an avenue for advancement in every known form of engineering—drafting has no equal. Aim as high as you like and you can reach your mark in this greatest of all professions. Just as the reconstruction of Europe will first have to be planned on the drafting table, so has the world been built—so will the world continue to be built. That is why **there is no limit to your success** as a draftsman.



Make Drafting Your Profession

The American School Home Study Course will enable you to master this great, interesting and congenial profession without in any way interfering with your present work. Just give us a part of your **spare time** and we'll do the rest. Our lessons are simplified, well illustrated, easily understood—and we coach you carefully from first lesson to the last. **You simply can't fail if you want to win.**

Draftsmen in Big Demand

Think for a minute of the colossal reconstruction plans of the United States—to say nothing of Europe—and you will get an idea of the busy years ahead for draftsmen in all branches. But there is ALWAYS a big demand for draftsmen—BECAUSE they are the fundamental factors in world's progress.

Satisfaction Guaranteed

Don't hesitate. Don't think you can't master our lessons by Home Study until you TRY. So sure are we that you can do as well as any of our thousands of students, we **Guarantee Satisfaction** or refund your money in full. That's how confident we are in our methods. Have you as much confidence in yourself? If so, check and mail the Coupon for FREE Bulletin.

DO YOU KNOW?

Do you know how to make chemical tricks?
Do you know how cloth is bleached?
Do you know how to test soil?
Do you want to make invisible ink?
Do you know how to test flour?
Do you know how Chlorine Smoke and Chlorine Gas (German War Gas), is made?
What do you know about chemistry in general?

These and hundred other interesting questions are answered and demonstrated with our Chemistry Laboratory which we present herewith.

CHEMISTRY!

We present herewith to our friends our new E. I. Co. Chemical Laboratory which contains real chemicals and apparata to perform real chemical experiments. This outfit is not a toy, put up merely to amuse, but a practical laboratory set, with all the chemicals, apparata and reagents necessary to perform real work and to teach the beginner all the secrets of inorganic chemistry. With this outfit we give free a book containing a Treatise in Elementary Chemistry, useful data and recipes, and 100 instructive and amusing experiments.

44 Chemicals
17 Apparata
1 Instruction Book with 100 Experiments

PRICE $5.00

Shipping Weight 10 lbs

CAN BE SHIPPED BY EXPRESS ONLY

The chemicals furnished are all technically pure and put up in appropriate wooden boxes and glass bottles, and there is a sufficient quantity to make dozens of experiments with each. The apparata are of standard laboratory size and quality.

Altho all chemicals have nearly doubled in price, we have decided not to raise the price for this outfit for the present.

Read the list of chemicals and apparata and look at the actual photograph of the outfit at your right.

And order one today!

THE E. I. Co. CHEMICAL LABORATORY

DESCRIPTION OF THE OUTFIT

It contains the following 44 chemicals:

Ammonium Chloride	Brimstone	Ferrous Sulphate	Iron Chloride
Alum	Iron Oxide	Nickel Sulphate	Calcium Oxide
Antimony	Sulphate of Zinc	Sodium Phosphate	Stannous Chloride
Boracic Acid	Magnesia Carbonate	Zinc Carbonate	Nickel Chloride
Charcoal	Zinc, Metallic	Ammonium Sulphate	Hydrochloric Acid
Sodium Nitrate	Sodium Bicarbonate	Ammonium Carbonate	Sulphuric Acid
Sodium Carbonate	Sodium Sulphate	Ammonium Aqua	Iodine
Sodium Borate	Sodium Chloride	Calcium Chloride	Mercury, Metallic
Sodium Sulphite	Calcium Sulphate	Chloride of Zinc	Tin, Metallic
Manganese Dioxide	Barium Chloride	Copper Sulphate	Litmus Paper
Oxalic Acid	Lead Acetate	Glycerol	Ferrous Sulphide

The following apparata are furnished:

One Standard Washbottle	Six Assorted Test-Tubes	Glass Tubing
One Alcohol Lamp	One Test-Tube Holder	One book containing Treatise on
One Conical Glass Measure	Ten Sheets of Filter Paper	Elementary Chemistry and 100
One Erlenmeyer Flask	One Glass Dropper	Chemical Experiments to be per-
One Glass Funnel	One Spoon Measure	formed with this outfit.
One Delivery Tube

PATENT ADVICE

Edited by H. GERNSBACK

In this Department we publish such matter as is of interest to inventors and particularly to those who are in doubt as to certain Patent Phases. Regular inquiries address to "Patent Advice" cannot be answered by mail free of charge. Such inquiries are publisht here for the benefit of all readers. If the idea is thought to be of importance, we make it a rule not to divulge all details, in order to protect the inventor as far as it is possible to do so.

Should advice be desired by mail a nominal charge of $1.00 is made for each question. Sketches and descriptions must be clear and explicit. Only one side of sheet should be written on.

Readers' attention is called to the fact that due to the great amount of letters to this department it is quite impossible to answer them all thru these columns: The inquiries answered in this issue date as far back as August, and if readers wish speedy service they should carefully note the announcement appearing in the preceding paragraph.

Combination Carriage and Sled.

(299) Peter E. Sparri, Detroit, Mich., sends us a description of a combination foot-power carriage and sled. This apparatus works by means of a paddle that can be raised or lowered at will. When converting the sled into a carriage, the runners are taken off, the back wheels are placed on the paddle axles and are pulled down and locked.

A. This idea is very unique and should find favor particularly in our northern states where there is a good deal of snow. We think a patent might be obtained on this device.

The same inventor also submits what he terms a "desk telephone," which is to do away with hanging up and taking down of the receiver. The idea is to have a stand which when lifted up makes the connections, while the entire combination is similar to the hand telephones, which incorporate a receiver and microphone combined.

A. This is a good idea, but we cannot offer much encouragement as to the patent phase, for the reason that a great many such devices are on the market and hundreds more have actually been patented. Somehow or other, there does not seem to be a very widespread demand for this apparatus.

Diving Device.

(300) Jess F. Perrin, Rapid City, S. D., writes as follows: "I have two ideas on which I would like to have your opinion as to practicability, usefulness and demand on the market. The first one is a small rubber device which fits in the nostrils to exclude the water when diving. It is thought that a device of this kind would be of great service to amateurs in learning how to swim. It could be retailed at 10c."

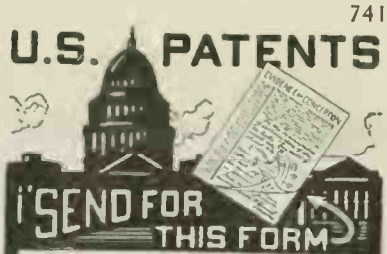
A. Without seeing the details and construction of this device, it is impossible for us to say whether it has any merit. We think, however, that there might be a demand for a device of this kind.

"The other device is an automatic printer for printing pictures. An automatic counter keeps the operator apprised as to the number of prints being taken. The prints are run thru all the necessary solutions and run out on a belt to dry. This machine could be made at an expense not exceeding $20.00. Your advice on this would also be appreciated."

A. There does not seem to be anything fundamentally new to this idea, and there are several printing machines of this kind on the market at the present time.

Automatic Airplane Control Stabilizer.

(301) Edward R. Young, Covington, Ky., writes: "Most airplanes are controlled by a 'joystick,' a lever on a universal joint arranged so that by moving it from side to side the airplane is steered and by moving backward and forward the elevation is changed. My idea embraces two levers, one to move forward and backward and the other to move from side to side. At the top of each of these levers, which are connected to the regular control wires just like a double control 'plane, is an iron rod. At the ends of these iron rods are magnets so that when the magnet at either end is excited it draws the iron rod, and joystick, a few inches in that direction, thus controlling the 'plane. Another magnet when excited will draw the rod still farther. The same applies to the other end of the iron rod and the other "joystick."



The principal part is the means for telling when these magnets should be excited. Just as we have tubes in our heads to tell us when we are off balance (literally) so is this apparatus intended to tell the airplane when it's off balance. A closed tube, longer than it is wide to prevent electrolyte from splashing, is fitted with a main contact in the bottom and contacts at each end so that if the 'plane dips forward (for example) the electrolyte runs forward, makes circuit with the first contact, excites first magnet and by the magnet drawing the "joystick" forward the level of the 'plane is corrected. If the 'plane continues to dip, the second magnet is excited which draws the "joystick" forward still farther. A large number of small magnets may be used so as to affect the 'plane very gradually and thus prevent jerks and strains. The other "joystick" fitted the same way only crosswise of the 'plane warps the wings or moves the aerofoils (at ends of wings) to control the direction of the 'plane and keep the two wings on a level.

The "brain" unit is made of porcelain, with a number of ridges on the inside to prevent the rather thick oily electrolyte from moving too freely, has a main contact to the battery and the other contacts (as many in each end as there are magnets at each end of "joystick") at each end of the tube. This is only a few inches long, the magnets are not heavy, and the whole apparatus does not take up much room and does not call for extensive changes in the airplane.

When the aviator changes the level of the 'plane he also changes the level of the porcelain tube so that when the airplane gets off of that level the device automatically corrects the position. The position of the magnets change when the aviator changes the level of the porcelain tubes so that when the airplane is on the correct level the magnets are at the ends of the iron rods at the tops of the "joysticks" ready for business. The aviator puts the 'plane on a certain level and this apparatus automatically keeps it there."

A. This is a highly ingenious idea, and Mr. Young deserves much credit for his invention. As will be noted Mr. Young has tried to design an "electro-mechanical brain" for the airplane. It is well known that the human brain has a device of this kind to keep us in an upright position. Fine tubes have a liquid which runs back and forward in these tubes and we thus stabilize ourselves. Mr. Young has tried to make use of this principle by using an electrolyte in a closed vessel and arranged to close various contacts so as to energize certain control magnets, substantially as set forth above.

While the idea is good, we have only one fault to find, viz., that the vessel containing electrolyte must be very small, as any abrupt lurching of the airplane would tend to throw the entire mechanism out of order, as can be readily imagined. If the contacts can be arranged in relatively fine, long

Don't Lose Your Rights

Before disclosing your inventioo to anyone send for blank form "Evidence of Conceptioo" to be signed and witnessed. A sample form together with printed instructions will show you just how to work up your evidence and establish your rights before filing application for patent. As registered patent attorneys we represent hundreds of inventors all over the U. S. and Canada in the advancement of inventions. Our schedule of fees will be found reasonable. The form "Evidence of Conception," sample, instructions relating to obtaining of patent and schedule of fees sent upon request. Ask for them,—a post card will do.

tubes where a displacement of the liquid will take place gradually, we believe that the device will function with a greater degree of success.

Automatic Air Hose Coupling.

(302) James Witkowski, Albion, N. Y., submits a drawing of an automatic air hose coupling with drawing, and wishes our opinion whether it is patentable and if it would be of any value if a patent could be obtained on it.

A. It is impossible to figure out on paper whether the brake would work satisfactorily. Indeed, we are not sure that the device is at all new. We would advise our correspondent to have a search made in the patent office thru one of the patent attorneys to ascertain what has been done previously in the art.

Electric Heater.

(303) Gottlieb Samuel Leventhal, Elmira, N. Y., submits a drawing on an electrical idea for heating water. The device is of the usual type whereby it can be attached to any faucet, the water started running and the current turned on. As the water runs thru this device and over the heating wires, the water is heated.

A. There is nothing fundamentally new to the device as submitted, except for the attractive form that our correspondent has given it, which is in the shape of a round ball. Outside of this, there is nothing new shown, and we are quite certain that no patent could be obtained.

Mechanical Brake.

(304) Emilio R. Salazar, Havana, Cuba, writes as follows: "I am enclosing blue-print and description of a contrivance to apply brakes on railroad cars with a request for you to publish it with your advice on the idea in your Patent Advice Section. Will you kindly let me know the possibilities of this invention?"

A. This is quite a complicated apparatus, and without seeing a model we think it is almost impossible for anyone to give an intelligent opinion. A brake of this kind looks all right on paper, but it is difficult to predict in advance if it will work out in practise. We would earnestly advise that before applying for patent on this apparatus that a model should be built.

BOY BURNED WHEN WET KITE STRING TOUCHES WIRES.

While Wm. Oliver of Port Stanley was amusing himself recently flying his kite he was severely burnt on both hands, when the flying string came in contact with the high voltage wires of a local railway. While flying his kite a strong wind sent it to the ground, and the wet cord came in contact with this power wire, as it fell over it. The victim got the full benefit of the voltage. This was much too strong for the string as it burnt it in two, for which William is very thankful as it saved his life. The only other small boy there ran away when he saw what had happened so he was alone when all was over. The burnt hands healed up all right, but Master Oliver, for one, will keep clear of all overhead electric wires hereafter, when he goes kite flying. It is remarkable that he was not killed outright, the high resistance of the kite string probably being the factor that saved his life.

RADIO AMATEURS DISCUST OFFICIALLY.

(*Continued from page 738*)

down to 250 meters. There may be trouble in the future, sir, between aircraft operating overland and working with their receiving or transmitting stations, and amateur stations. That is a possibility of the future that I will call the attention of the committee to at this time, because this thing may come up here at another time under some future law, and, I simply want to warn the committee that this is a new field that we know nothing about. Aircraft radio was not in existence to any extent when amateurs last operated. There may be interference between amateur operators and aircraft radio stations, but it is hoped that there will not be.

Mr. Saunders: Government ownership has nothing to do with that problem?

Lieut. Cooper: Except the Government would probably be operating the stations for aircraft.

Mr. Saunders: The possibility which you speak of which may arise hereafter is a thing that will be met by appropriate regulations, is it not?

Lieut. Cooper: It might be, sir, if this amendment is past, that it might have to be met by legislation again reducing the wave length back to where it is now.

Mr. Saunders: Appropriate legislation?

Lieut. Cooper: It might be legislation and not regulation.

Mr. Saunders: Legislation is just that much more authoritative than regulation.

Lieut. Cooper: I usually think of "regulation" as a regulation of a department.

Mr. Saunders: I admit that is so in general, where you think of something issued by some department head or some Bureau Chief.

PRESIDENT WILSON ALWAYS IN TOUCH WITH WASHINGTON—VIA RADIO.

(*Continued from page* 708)

Lyons Station, France, was established long before the *Pennsylvania* was beyond communication range of the United States.

The *Pennsylvania* has six receiving booths, which were able to receive on eight different tunes simultaneously as follows: One booth guarded Annapolis or New Brunswick tunes 16,900-13,000 meters; one booth guarded Lyons tunes 15,500 meters; one booth guarded Tuckerton's tune 9,200 meters; one booth guarded 4,000 meters (the Standard arc calling tune); one booth guarded 450 meters for the U. S. S. *George Washington* vacuum tube transmitter tune and one booth guarded 297 meters (the radio telephone tune). One additional operator guarded 600 and 952.

The radio stations at Otter Cliffs, Maine and Lyons, France, were used to receive messages from the President, transmitted by the U. S. S. *Pennsylvania's* arc.

The *George Washington's* radio equipment consisted of the following: One low power spark transmitting set, one 16,900 long wave receiving set, one short wave 600 meter spark receiving set, one short range radio telephone transmitting and receiving set, one vacuum tube 450 meter transmitting and receiving set. The U. S. S. *George Washington* was able to intercept messages transmitted by the Annapolis or New Brunswick stations and guard 600 meter (commercial calling, and emergency tune and the radio telephone and vacuum tunes) simultaneously. Messages for the President transmitted from the United States by the Annapolis, New Brunswick, Tuckerton and the Lyons station were received by the U. S. S. *Pennsylvania* and relayed to the *George Washington* by means of radio telephone and vacuum tube transmitting sets simultaneously.

The messages from the President destined to United States or France were sent from the *George Washington* to the *Pennsylvania* by the vacuum tube or radio telephone set and were relayed by the *Pennsylvania's* high power arc transmitter direct to the United States, Lyons or Brest, France.

The radio communication was directed by Commander H. W. McCormack, U.S.N., Fleet Radio Officer. Lieutenant S. V. Edwards is in charge of the radio of the *Pennsylvania*.

NIKOLA TESLA AND HIS INVENTIONS.

(*Continued from page* 697)

nerve-racking spectacle. Then, inevitably, in the stillness of night, a vivid picture of the scene would thrust itself *before* my eyes and persist despite all my efforts to banish it. Sometimes it would even remain fixt in space tho I pushed my hand thru it. If my explanation is correct, it should be possible to project on a screen the image of any object one conceives and make it visible. Such an advance would revolutionize all human relations. I am convinced that this wonder can and will be accomplished in time to come; I may add that I have devoted much thought to the solution of the problem.

To free myself of these tormenting appearances, I tried to concentrate my mind on something else I had seen, and in this way I would often obtain temporary relief; but in order to get it I had to conjure continuously new images. It was not long before I found that I had exhausted all of those at my command; my "reel" had run out, as it were, because I had seen little of the world—only objects in my home and the immediate surroundings. As I performed these mental operations for the second or third time, in order to chase the

Learn Public Speaking

10 LESSONS FREE

Write — quick — for particulars of this extraordinary offer; an opportunity you will never forget if you take advantage of it. Ten lessons in effective public speaking absolutely FREE to those who act promptly, to introduce our course in localities where it is not already known.

We teach you by mail to become a powerful and convincing speaker—to influence and dominate the decisions of one man or an audience of a thousand. We have trained hundreds and helped them to increase their earnings and their popularity. Learn, in your spare time at home, how to overcome "stage fright" and conquer fear of others; how to enlarge your vocabulary; how to develop self-confidence and the qualities of leadership; how to RULE others by the power of your speech alone; how to train your memory. Our

WHAT THE COURSE TEACHES YOU.

How to talk before your club or lodge;
How to address board meetings;
How to propose and respond to toasts;
How to make a political speech;
How to tell entertaining stories;
How to make after-dinner speeches;
How to converse interestingly;
How to write better letters;
How to sell more goods;
How to train your memory;
How to enlarge your vocabulary;
How to develop self-confidence;
How to acquire a winning personality;
How to strengthen your will power and ambition;
How to become a clear, accurate thinker;
How to develop your power of concentration;
How to be the master of any situation.

New Easy Method

perfected and taught only by Prof. R. E. Pattison Kline, former Dean of the Public Speaking Department of the Columbia College of Expression, can be learned in 15 minutes a day. Prof. Kline is one of the foremost authorities in the country on public speaking and mental development. Do not let this chance escape you.

What 15c will bring You from the Nation's Capital

Washington, the home of the Pathfinder, is the nerve center of civilization; history is being made at this world capital. The Pathfinder's illustrated weekly review gives you a clear, impartial and correct diagnosis of public affairs during these strenuous, epoch-making days.

The little matter of 15c in stamps or coin will bring you the Pathfinder 13 weeks on trial. The Pathfinder is an illustrated weekly, published at the Nation's center, for the Nation: a paper that prints all the news of the world and tells the truth and only the truth: now in its 26th year. This paper fills the bill without emptying the purse: it costs but $1 a year. If you want to keep posted on what is going on in the world, at the least expense of time or money, this is your means. If you want a paper in your home which is sincere, reliable, entertaining, wholesome, the Pathfinder is yours. If you would appreciate a paper which puts everything clearly, fairly, briefly—here it is. Send 15c to show that you might like such a paper, and we will send the Pathfinder on probation 13 weeks. The 15c does not repay us, but we are glad to invest in new friends. **The Pathfinder, Box 76, Washington, D.C.**

Monuments—Mausoleums—Statuary

No matter what your needs, we can serve you most advantageously. Estimates and designs submitted. Mail orders as carefully executed as though you had called in person. Write for particulars.

SPECIALISTS IN DESIGN AN DCONSTRUCTION

appearances from my vision, the remedy gradually lost all its force. Then I instinctively commenced to make excursions beyond the limits of the small world of which I had knowledge, and I saw new scenes. These were at first very blurred and indistinct, and would flit away when I tried to concentrate my attention upon them, but by and by I succeeded in fixing them; they gained in strength and distinctness and finally assumed the concreteness of real things. I soon discovered that my best comfort was attained if I simply went on in my vision farther and farther, getting new impressions all the time, and so I began to travel—of course, in my mind. Every night (and sometimes during the day), when alone, I would start on my journeys—see new places, cities and countries—live there, meet people and make friendships and acquaintances and, however unbelievable, it is a fact that they were just as dear to me as those in actual life and not a bit less intense in their manifestations.

This I did constantly until I was about seventeen when my thoughts turned seriously to invention. Then I observed to my delight that I could visualize with the greatest facility. I needed no models, drawings or experiments. I could picture them all as real in my mind. Thus I have been led unconsciously to evolve what I consider a new method of materializing inventive concepts and ideas, which is radically opposite to the purely experimental and is in my opinion ever so much more expeditious and efficient. The moment one constructs a device to carry into practise a crude idea he finds himself unavoidably engrost with the details and defects of the apparatus. As he goes on improving and reconstructing, his force of concentration diminishes and he loses sight of the great underlying principle. Results may be obtained but always at the sacrifice of quality.

My method is different. I do not rush into actual work. When I get an idea I start at once building it up in my imagination. I change the construction, make improvements and operate the device in my mind. It is absolutely immaterial to me whether I run my turbine in thought or test it in my shop. *I even note if it is out of balance.* There is no difference whatever, the results are the same. In this way I am able to rapidly develop and perfect a conception without touching anything. When I have gone so far as to embody in the invention every possible improvement I can think of and see no fault anywhere, I put into concrete form this final product of my brain. Invariably my device works as I conceived that it should, and the experiment comes out exactly as I planned it. In twenty years there has not been a single exception. Why should it be otherwise? Engineering, electrical and mechanical, is positive in results. There is scarcely a subject that cannot be mathematically treated and the effects calculated or the results determined beforehand from the available theoretical and practical data. The carrying out into practise of a crude idea as is being generally done is, I hold, nothing but a waste of energy, money and time.

My early affliction had, however, another compensation. The incessant mental exertion developed my powers of observation and enabled me to discover a truth of great importance. I had noted that the appearance of images was always preceded by actual vision of scenes under peculiar and generally very exceptional conditions and I was impelled on each occasion to locate the original impulse. After a while this effort grew to be almost automatic and I gained great facility in connecting cause and effect. Soon I became aware, to my surprise, that every thought I conceived was suggested by an external impression. Not only this but all my actions were prompted in a similar way. In the course of time it became perfectly evident to me that I

www.americanradiohistory.com

was merely an *automaton* endowed with power of movement, responding to the stimuli of the sense organs and thinking and acting accordingly. The practical result of this was the art of *telautomatics* which has been so far carried out only in an imperfect manner. Its latent possibilities will, however, be eventually shown. I have been since years planning self-controlled automata and believe that mechanisms can be produced which will act as if possest of reason, to a limited degree, and will create a revolution in many commercial and industrial departments.

I was about twelve years old when I first succeeded in banishing an image from my vision by wilful effort, but I never had any control over the flashes of light to which I have referred. They were, perhaps, my strangest experience and inexplicable. They usually occurred when I found myself in a dangerous or distressing situation or when I was greatly exhilarated. In some instances I have seen all the air around me filled with tongues of living flame. Their intensity, instead of diminishing, increased with time and seemingly attained a maximum when I was about twenty-five years old. While in Paris, in 1883, a prominent French manufacturer sent me an invitation to a shooting expedition which I accepted. I had been long confined to the factory and the fresh air had a wonderfully invigorating effect on me. On my return to the city that night I felt a positive sensation that my brain had caught fire. I saw a light as tho a small sun was located in it and I past the whole night applying cold compressions to my tortured head. Finally the flashes diminished in frequency and force but it took more than three weeks before they wholly subsided. When a second invitation was extended to me my answer was an emphatic NO!

These luminous phenomena still manifest themselves from time to time, as when a new idea opening up possibilities strikes me, but they are no longer exciting, being of relatively small intensity. When I close my eyes I invariably observe first, a background of very dark and uniform blue, not unlike the sky on a clear but starless night. In a few seconds this field becomes animated with innumerable scintillating flakes of green, arranged in several layers and advancing towards me. Then there appears, to the right, a beautiful pattern of two systems of parallel and closely spaced lines, at right angles to one another, in all sorts of colors with yellow-green and gold predominating. Immediately thereafter the lines grow brighter and the whole is thickly sprinkled with dots of twinkling light. This picture moves slowly across the field of vision and in about ten seconds vanishes to the left, leaving behind a ground of rather unpleasant and inert grey which quickly gives way to a billowy sea of clouds, seemingly trying to mould themselves in living shapes. It is curious that I cannot project a form into this grey until the second phase is reached. Every time, before falling asleep, images of persons or objects flit before my view. When I see them I know that I am about to lose consciousness. If they are absent and refuse to come it means a sleepless night.

To what an extent imagination played a part in my early life I may illustrate by another odd experience. Like most children I was fond of jumping and developed an intense desire to support myself in the air. Occasionally a strong wind richly charged with oxygen blew from the mountains rendering my body as light as cork and then I would leap and float in space for a long time. It was a delightful sensation and my disappointment was keen when later I undeceived myself.

During that period I contracted many strange likes, dislikes and habits, some of which I can trace to external impressions while others are unaccountable. I had a

The Man Who *Wouldn't* Stay Down

He was putting in long hours at monotonous unskilled work. His small pay scarcely lasted from one week to the next. Pleasures were few and far between and he couldn't save a cent.

He was down—but he *wouldn't stay there!* He saw other men promoted, and he made up his mind that what they could do *he* could do. Then he found the *reason* they were promoted was because they had special training—an expert knowledge of some one line. So he made up his mind that *he* would get that kind of training.

He marked and mailed to Scranton a coupon like the one below. That was his first step upward. It brought him just the information he was looking for. He found he could get the training he needed right at home in the hours after supper. From that time on he spent part of his spare time studying.

The first reward was not long in coming—an increase in salary. Then came another. Then he was made Foreman. Now he is Superintendent with an income that means independence and all the comforts and pleasures that make life worth living.

It just shows what a man with ambition can do. And this man is only one out of hundreds of thousands who have climbed the same steps to success with the help of the International Correspondence Schools.

What about *you?*

Are you satisfied merely to hang on where you are or would you, too, like to have a real job and real money? It's entirely up to you. You don't *have* to stay down. You *can* climb to the position you want in the work you like best. Yes, you can! The I. C. S. are ready and anxious to come to you, wherever you are, with the very help you need.

Surely when you have an opportunity that means so much, you can't afford to let another priceless hour pass without at least finding out about it. And the way to do that is easy—without cost, without obligating yourself in any way, mark and mail this coupon.

CORE WIRE

We have been fortunate in securing thru auction several tons of guaranteed pure, double annealed Norway Iron Core Wire and are selling this wire to "Experimenter" readers

AT PRE-WAR PRICES 20cts LB.

This wire is just the thing for spark coils, transformers, etc., and it is, of course, a very much more superior product than the usual iron wire. We absolutely guarantee the quality.

If you ever thought of building a spark coil, transformer, or similar apparatus, now is the chance to get the right material for it. As far as we know this is the only lot of iron Norway Core Wire in the hands of any dealer at the present time, and none can be gotten until after the war.

We have only two sizes left:

26 INCHES 36 INCHES

Thickness about No. 21 B and S

If either of these sizes should be too long we advise cutting the wire down yourself by means of shears. It will pay you to do so as real Norway Iron Wire, sold by a few dealers last year, brought from 40c to 50c a pound. American core wire now sells for from 30c upwards per pound.

As long as the supply lasts we offer this wire as described above to our customers at the very low price of 20c a pound. Order at once.

ELECTRO IMPORTING CO., 231 Fulton St., N. Y. C.

$1.00 Down
Brings You A Suit
Tailor-Made-To-Order

Greatest suit offer ever made! Think of it—for only $1.00 down we make up a suit from the fabric you select strictly according to your own individual measurements, and send it to you for examination and try on. If you are perfectly satisfied, keep it and pay balance in easy monthly payments so small you scarcely miss the money. If not satisfied, return suit and we will immediately refund your dollar. Send for Style Book and see how you can

Save Half

Because of our early buying in vast quantities, our enormous volume and direct selling plan you actually get your suit at about half what it would ordinarily cost. Don't buy ready mades—don't pay double our price for a strictly made-to-order suit—a suit that is made to fit the lines of your figure perfectly, has snap and style, gives you long wear and holds its shape. That's the kind of suit you get from Stanley-Rogers and besides you have

5 Months To Pay

Absolutely wide open credit. You wear the suit while paying for it. We trust you absolutely. Your word is all the security we ask. No red tape, no delay.

$1000 Reward to anyone who proves that we do not make all our men's suits tailor-made-to-order according to each customer's individual measurements. Some firms try to fool you by telling you they make clothes "to measure", and then simply sell "hand-me-downs" altered here and there. There's a big difference between "made-to-order" and "made-to-measure". Stanley-Rogers solts SHOW the difference in style, fit and long wear.

FREE Style Book Write at once for your free copy of our wonderful 1918-19 Style Book. See the actual cloth samples of most beautiful weaves and perfect reproduction of latest fashions. Send postal or letter—NOW! Get free style book. Don't delay! Write today.

1015 Jackson Blvd. Dept. 805 Chicago

THIS is Richard A. Oldham. He earned $2200.00 in four months with a Haywood Tire Repairing outfit. For 20 years he was telegraph operator on the Illinois Central Railway. He is now 58 years old. He answered my advertisement—quit his job—bought a plant and opened a business. He just wrote me "I have made more in eight months than 2½ years as operator." There are now 500 stations where tire repairing is neglected.

I Must Have 500 Men
To Fill These Positions

I have a Big interesting Book to send you. It tells all about tires—gives inside figures and profit. Send for it! What Oldham and others are doing You can do. $2500.00 to $4,000.00 per year is conservative. Like Mr. Oldham—One machine will start you. Then open a shop. You can see business all around you. Put out a Haywood Sign and business will come to you. Now get started. Send for the Big Book and start making money.

violent aversion against the earrings of women but other ornaments, as bracelets, pleased me more or less according to design. The sight of a pearl would almost give me a fit but I was fascinated with the glitter of crystals or objects with sharp edges and plane surfaces. I would not touch the hair of other people except, perhaps, at the point of a revolver. I would get a fever by looking at a peach and if a piece of camphor was anywhere in the house it caused me the keenest discomfort. Even now I am not insensible to some of these upsetting impulses. When I drop little squares of paper in a dish filled with liquid, I always sense a peculiar and awful taste in my mouth. I counted the steps in my walks and calculated the cubical contents of soup plates, coffee cups and pieces of food,—otherwise my meal was unenjoyable. All repeated acts or operations I performed had to be divisible by three and if I mist I felt impelled to do it all over again, even if it took hours.

Up to the age of eight years, my character was weak and vacillating. I had neither courage or strength to form a firm resolve. My feelings came in waves and surges and vibrated unceasingly between extremes. My wishes were of consuming force and like the heads of the hydra, they multiplied. I was opprest by thoughts of pain in life and death and religious fear. I was swayed by superstitious belief and lived in constant dread of the spirit of evil, of ghosts and ogres and other unholy monsters of the dark. Then, all at once, there came a tremendous change which altered the course of my whole existence.

Of all things I liked books the best. My father had a large library and whenever I could manage I tried to satisfy my passion for reading. He did not permit it and would fly into a rage when he caught me in the act. He hid the candles when he found that I was reading in secret. He did not want me to spoil my eyes. But I obtained tallow, made the wicking and cast the sticks into tin forms, and every night I would bush the keyhole and the cracks and read, often till dawn, when all others slept and my mother started on her arduous daily task. On one occasion I came across a novel entitled "Abafi" (the Son of Aba), a Serbian translation of a well known Hungarian writer, Josika. This work somehow awakened my dormant powers of will and I began to practise self-control. At first my resolutions faded like snow in April, but in a little while I conquered my weakness and left a pleasure I never knew before—that of doing as I willed. In the course of time this vigorous mental exercise became second nature. At the outset my wishes had to be subdued but gradually desire and will grew to be identical. After years of such discipline I gained so complete a mastery over myself that I toyed with passions which have meant destruction to some of the strongest men. At a certain age I contracted a mania for gambling which greatly worried my parents. To sit down to a game of cards was for me the quintessence of pleasure. My father led an exemplary life and could not excuse the senseless waste of time and money in which I indulged. I had a strong resolve but my philosophy was bad. I would say to him, "I can stop whenever I please but is it worth while to give up that which I would purchase with the joys of Paradise?" On frequent occasions he gave vent to his anger and contempt but my mother was different. She understood the character of men and knew that one's salvation could only be brought about thru his own efforts. One afternoon, I remember, when I had lost all my money and was craving for a game, she came to me with a roll of bills and said, "Go and enjoy yourself. The sooner you lose all we possess the better it will be. I know that you will get over it." She was right. I conquered my passion

Skinderviken Transmitter Button

See what the editor of Electrical Experimenter says about the button:

New York, Oct. 22, 1918.
J. SKINDERVIKEN, National Hotel, Washington, D. C.

In writer's opinion, obtained by actual elaborate tests, your Transmitter Button is probably most efficient device of its kind on market today, due to its simplicity and other outstanding features. Should have a great future.

H. GERNSBACK.

See what a couple of Electrical Experimenter readers say about the button:

New Brighton, Pa.
Dec. 16, 1918.

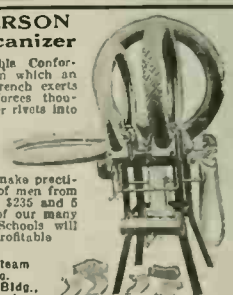
Dear Sirs:
I have been using one of your Transmitter Buttons for experimental work, and it certainly lives up to all you say for it and then some.

Yours truly,
HARRY H. BRUHN.

Wash, D. C.
Dec. 18, 1918.

DEAR SIRS:
I received the Transmitter Button and I am well pleased with it. It is everything you claim it to be and more too.

Yours truly,
G. A. WICK.



We have now thousands of buttons in stock and can ship same day as order is received. Send remittance with order as per our money back guarantee. See our ad page 734.

We have large stock of necessary supplementary equipment for experimenting. Send for a complete list. Receivers $1.00. Induction Coils from $0.35. Ringers from $0.35. Generators from $1.75.

then and there and only regretted that it had not been a hundred times as strong. I not only vanquished but tore it from my heart so as not to leave even a trace of desire. Ever since that time I have been as indifferent to any form of gambling as to picking teeth.

During another period I smoked excessively, threatening to ruin my health. Then my will asserted itself and I not only stopt but destroyed all inclination. Long ago I suffered from heart trouble until I discovered that it was due to the innocent cup of coffee I consumed every morning. I discontinued at once, tho I confess it was not an easy task. In this way I checked and bridled other habits and passions and have not only preserved my life but derived an immense amount of satisfaction from what most men would consider privation and sacrifice.

After finishing the studies at the Polytechnic Institute and University I had a complete nervous breakdown and while the malady lasted I observed many phenomena strange and unbelievable.

(*To be continued in our March issue*)

TEN TELEPHONE OR FORTY TELEGRAPH CURRENTS OVER ONE CIRCUIT.

POSTMASTER GENERAL BURLESON on December 12th made public a letter from Theodore N. Vail announcing the invention and development by the technical staff of the Bell system of a practical method of multiplex telephony and telegraphy, which is expected to revolutionize long-distance wire communication.

Mr. Vail, who is President of the American Telephone and Telegraph Company, explained that there can be a combination of telegraphy and telephony under this invention by which a pair of wires, i.e., one full metallic circuit, will be available either for *five simultaneous telephone conversations* (*ten voices*) or for *forty simultaneous telegraph messages*, or partly for one and partly for the other.

With this new system four telephone conversations over one pair of wires are simultaneously carried on *in addition to* the telephone conversation provided by the ordinary methods. Thus, over a single pair of wires a total of five telephone conversations are simultaneously operated, each giving service as good as that provided by the circuit working in the ordinary way.

Heretofore the best telephone methods known to the art provided only one telephone conversation at a time over a single pair of wires. A number of years ago there was developed the *phantom circuit* arrangement, by which three telephone circuits were obtained from two pairs of wires, an important improvement, of which extensive use has been made commercially. Now, by the multiplex method we are enabled to obtain *five telephone circuits* over one pair of wires, that is, *ten simultaneous telephone conversations* from the two pairs of wires which formerly could be used for only three simultaneous telephone conversations. This represents an increase of more than threefold in the telephonic capacity of the wires, as compared with the best previous state of the art.

Some proposals made by the earlier workers in this particular field have naturally proved suggestive in the successful solution of the problem, particularly a suggestion made by Maj. Gen. George O. Squier, Chief Signal Officer of the United States Army, about ten years ago, and which at the time attracted very general attention.

Furthermore, while working in entirely different fields and with a different objective, Dr. Lee deForest a number of years ago invented a wireless device known as the Audion, which by improvements and adaptation has been made an important part of the Bell telephone system.

Become an Electrician In One Year Here
Or Learn An Electrical Trade In 6 Months

THIS school teaches electricity thoroughly, from the very fundamentals, including the laws and principles of electricity and the theory of direct current—together with practical lectures and problems, actual training in laboratory work and electrical machine departments of designing, building, repairing, installing, operating, etc. And the faculty here are practical electrical engineers who know how and what to teach because they know what knowledge and ability the great field of Electricity requires.

As one example of this school's thoroughness and practical training and development, witness the picture above, showing view of armature winding department, where students actually wind armature—D.C. and A.C.—by a most successfully practical and unique method.

The thoroughness in essentials here, the practical training and able faculty, together with this school's broad facilities and intensive abilities, are the reasons why you can become an Electrician here in one year, or master one of the Electrical Trades in 6 months.

If you are determined to achieve success in the Electrical Field this is your school. You will acquire and accomplish more in a shorter time at a less cost and be a fully developed, practical electrical man when you finish. Mail the coupon at the right and get complete illustrated and descriptive details of the advantages this school affords. If interested in Electrical Engineering with B.S. degree, check same on coupon. Mail the coupon now.

A STUDENTS' Cooperative Dormitory and Boarding Club is organized here with modern and completely equipped school quarters for housing and boarding students—conducted by student committees for the athletic, social and academic welfare of the students and establishing living economy and comfort. Fully explained on request.

You Can Earn While You Learn

WE will provide you with part time employment to help defray your expenses here and give you actual outside experience—without interfering with your class hours—which is fully explained in our catalog. Mail the coupon.

Salesmen Must Take the Place of War Contracts

Now That The War Is Over

SALESMEN

are Needed to Get Peace-Time Orders to Keep Plants Busy

$2,500 to $10,000 A Year for Salesmen

Factories everywhere have been working day and night on war contracts. With peace returned, these factories must go back to peace time work. War contracts require no salesmen. Peace time orders must be produced by salesmen. Salesmen will be the most vital factor in business. Factories backed by best salesmen will be the busiest. Crack salesmen will command practically their own price. Prepare now for this most essential peace time work.

Let Us Make You a STAR SALESMAN

We taught E. C. Kisler—formerly earning $75 a month—has earned as high as $375 a month as salesman. We taught C. W. Birmingham—former clerk at $15 a week—has earned $125 a week as sales manager. We taught George W. Kearns—formerly earned $60 a month—has since earned $306 in one week as a salesman. Our simple course teaches the exact laws of successful selling—making you more efficient than 99 out of 100 men who learned only through grinding experience. We train you in your spare time in your own home, so you can earn while you learn.

Wonderful New Book FREE!

Investigate by writing for our free book "A Knight of the Grip" which tells what our Training and Service will do for you. Let us tell you about our Free Employment Department, which has constantly on file more requests for salesmen than we can possibly fill. WE TRAIN you and PLACE you. Write today—Now. Easy terms and special price for limited time. Don't rob your whole future by one minute's neglect. Mail coupon or postal NOW.

STECO. 2134 N. Clark St., Chicago, Ill.

CURING SOLDIERS' ILLS WITH ELECTRICITY.

(*Continued from page 695*)

were 3,000 shell-shock victims; the day the armistice was signed 2,000 of them recovered, showing what a peculiar and baffling mental ailment this is.

The photograph, Fig. 2, was taken at the American Red Cross War Hospital, located at Paignton, Devon, France, which is one of the finest and best equipt in the Red Cross service. This hospital has a staff of 150 nurses under the direction of Army medical officers. The photograph shows a soldier undergoing an electric bath treatment for rheumatism. This treatment is given in the massage room at the hospital, where multifarious other electrical machines and appliances are to be found, including electrical massage vibrators, electric heating pads, etc.

In some of the larger base hospitals, very elaborate electrical equipment has been made available. In some of the American Army hospitals in the United States, where the returning wounded are being carefully attended to, so as to make them as well and strong as they were when they went overseas to fight the Boche, there are some of the very latest instruments and apparata about which little is known outside of the medical profession. This equipment includes among other things the *Electro-cardiograph*, which comprises an extremely sensitive electrical galvanometer, capable of recording the beats of the heart on a photographic film, so that the exact condition of the heart with regard to its manner of beating and its strength, can be minutely and accurately studied by the physicians.

At one of the large New York debarkation hospitals everything is done by electricity—even to the cooking. This hospital has one of the largest X-ray laboratories in the world, each of the 26 X-ray rooms being equipt with a special dark room for rapidly developing and finishing the X-ray plates. The X-ray in itself has undoubtedly saved thousands of lives in the great conflict, in many cases when the victims of bullet and shell wounds would certainly have died, had it not been for this wonderful scientific machine. Owing to the terrific fragmentation (splintering) of the shell now used, which often causes small steel splinters to penetrate parts of the body where they would never be suspected, and which, if they were not quickly discovered by the X-ray, would be quite liable to affect the heart, lungs or blood vessels at some unexpected time and cost the victim his life. For this reason the returning wounded are most minutely examined and X-rayed, especially in the abdomen and chest regions, where many of these shell splinters, and even bullets, are fond of lodging and camouflaging themselves for long periods, only to cause trouble at some later date, with possibly fatal results.

THE UNKNOWN PURPLE.

(*Continued from page 690*)

last act, in which scene the hero is visible to the eye in flesh and blood but slowly and gradually fades away into nothing, leaving only the purple glow. This was quite impressive and, of course, was done by the usual magician's mirror effect, whereby the hero was not on the stage at all, but below it, thus casting his reflection on a fine screen on the stage; then by manipulating the lights in a certain manner the picture would dissolve into emptiness.

Altogether the stage technique is very cleverly arranged with an absurdly simple effect which in a similar attempt would be very elaborate. Outside of that the plot and theme of the play is quite out of the ordinary and is deserving of mention.

To show just how different this play is from others, reference must be made to a note in the program over which audiences puzzle themselves until the play itself makes the meaning clear. To wit: "The first epi-

sode of the last act occurs before the last episode of the preceding act." It simply means that at that critical time the action is going on in two places at once: and because the stage cannot jump back and forth in a flash like the motion picture, part of the story has to be postponed until the scene shifters catch up.

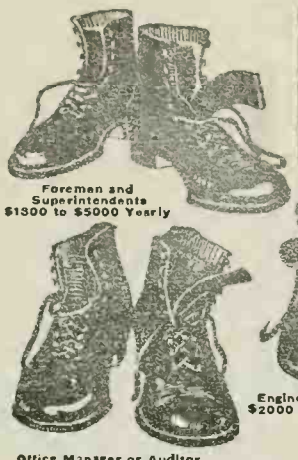
The illustrations which we present herewith are, of course, doctored up for the reason that if they were not nothing at all would be seen. It is very necessary to show the pictures in this manner, otherwise we would revert back to our camouflaged front cover,—the blank space showing nothing,—and as the Editors must show pictures—well you know how it is:

A little camouflage here and then
Is often mightier than the pen!

EXPERIMENTAL MECHANICS.

(*Continued from page 717*)

much more difficult than the ordinary run of lathe work. Fig. 5 shows how a crank pin, 1, with its rods, is set to be revolved between centers 2, 2, of the lathe. This is made with provisions for attaching to the crank rod 4, 4, temporary support plates 3, 3, on the ends of the crank shaft, and drilling center holes in the plates in line with the *center of the crank pin to be turned.* The main portions of the crank shaft D, D, must first be turned, tho not necessarily to their finished size. The plates 3, 3, must be bored out to be a tight fit on the ends of the crank shafts, to which they are further secured by a set screw as indicated. The crank shaft is then laid on a surface plate or on the lathe bed, which will answer this purpose very well, and the centers of the crank pin, 1, determined and carefully marked on the supporting plates, 3, 3, so that when mounted between lathe centers the axis shall pass thru the central axis of the crank pin. The center holes should be drilled and countersunk in the usual way at these points. The crank shaft may then be mounted in the lathe on its centers, and one end secured to the face plate with a dog and the crank pin then turned to proper size.



It will be found in turning crank shafts that the work as a whole is very much out of balance, and will require a counterbalance weight on the opposite side to the driving of the lathe. This work will be of interest to those building engines, etc.

(*To be continued*)

PRODUCING RAIN BY ELECTRICITY AND X-RAYS.

(*Continued from page 687*)

valve rectifiers, is used to produce the high potential current for operating the X-ray tube, and this current is fed to the tube thru the two wires leading up to the balloon. The X-ray tube itself is placed in a light water-proof compartment suspended from a spar just below the balloon, as the illustration shows. As will be seen, the Röntgen-ray tube is so hung that its rays are directed upward, so as to impinge upon the metallized surface of the balloon, which, as will be remembered, is charged at a very high potential. Suitable high voltage, strain insulators are placed in the lead wires at all the points shown. A recording instrument such as hot-wire ammeter is connected in series with the high tension lead wire. If the ground switch is closed, then any static charge in the neighborhood of the balloon is conveyed to earth, an indication being obtained on the instrument. When the ground switch is opened and the power circuit closed, the air surrounding the balloon for a radius of several hundred feet is endowed with conductive qualities as a result of the emanations from the X-ray tube. When the ultra-high voltage

Learn to Fill Bigger Shoes

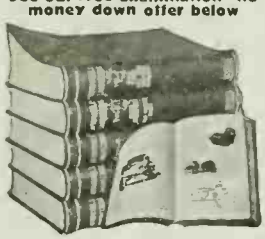
NO matter what kind of work you are doing now, a set of these great home study books will quickly fit you for a bigger and better paying job. We will send any set you select for one week's FREE examination, and if you want to keep them you pay only the special reduced price—at the rate of 50 cents a week. This is your opportunity to make more money—grasp it NOW. Use these books and a little spare time and LEARN TO FILL BIGGER SHOES.

Carpentry and Contracting
Five volumes, 2138 pages and more than 400 illustrations. Prepares for Contractor, Building Superintendent and Carpenter Foreman. Regular price, $25.00. Special price, $17.80.

Civil Engineering
Nine volumes, 3900 pages and 3000 illustrations, plates and diagrams. Prepares for Civil or Structural Engineer, Transitman, Estimator, Designer or Chief Draftsman. Regular price, $45.00. Special price, $29.80.

Telephony and Telegraphy
Four volumes, 1725 pages and 2000 illustrations, plates and diagrams. Prepares for Telephone Engineer, Wire Chief, Exchange Manager, Trouble Man or Telegrapher. Regular price, $20.00. Special price, $12.80.

Steam and Gas Engineering
Seven volumes, 3300 pages and 2500 illustrations, plates, diagrams, etc. Prepares for Stationary, Marine or Locomotive Engineer or Fireman. Regular price, $35.00. Special price, $21.80.



Law and Practice
(with Reading Course in 25 bound pamphlets). Thirteen volumes, 6000 pages and 24 illustrations. Prepares for all Bar Examinations. A wonderful aid to business men. Regular price, $72.00. Special price, $39.80.

Practical Accounting
Four volumes, 1840 pages and 800 illustrations, plates and diagrams. C. P. A. questions and practical problems. Prepares for Accountant, Bookkeeper or Cost Clerk. Regular price, $20.00. Special price, $12.80.

Pay Raisers

These books are written by well known authorities—the top-notchers in each line. They will help you make more money. You can't fail to understand them, because they are written in plain, everyday language. Thousands of photographs, diagrams, charts, etc., help to make difficult points as simple as A-B-C.

ELECTRICITY!

HERE'S just the book on Electricity that you need to answer your many questions—to solve your knotty problems, to teach you new kinks, to be your memory for tables, rules, formulas and other Electrical and Mechanical facts that some people try to carry in their heads—and fail.

With this "Little Giant" I. C. S. Electrical Engineer's Handbook in your pocket, toolchest, on your work bench, drawing table or desk, an hour or a day need not be lost "digging up" some forgotten rule, some unfamiliar fact; you'll just turn to the very complete index and get it "in a jiffy." Just a few of the subjects treated are:

Electricity and Magnetism: Electrical Symbols: Batteries; Circuits: Magnets; Direct and Alternating Currents: Dynamos and Motors; Belts; Shafting; Electroplating; Electrical Measurements: Meters; Arc and Incandescent Lamps: Mercury Arc Rectifiers; Transformers; Insulation; Electric Cars: Single and Multiple-Unit Control: Transmission: Rail Welding: Tables of Wires—Sizes, Capacities, etc.,—Mathematical Rules: Formulas, Symbols: Tables of Constants, Equivalents, Roots, Powers, Reciprocals, Areas, Weights and Measures: Chemistry: Properties of Metals: Principles of Mechanics: First Aid, etc.

The Electrical Engineer's Handbook is one of 22 I. C. S. Handbooks covering 22 Technical, Scientific and Commercial subjects (See titles in coupon below.) They have the contents of a full-size book condensed into pocket size ready to go with you anywhere and be at your instant command. Substantially bound in cloth, red edges, goldleaf stamping, printed from new, clear, readable type on good quality book paper and illustrated wherever a picture will help.

No Risk Money-Back Offer!

The price of the famous I. C. S. Handbooks, of which more than 2,000,000 have been sold and are in practical everyday use, is $1 per copy. So confident are we that you will find them exactly what you need for ready reference in your work, that we stand ready to promptly and cheerfully refund your money if for any reason you are not fully satisfied with their value. Simply send a letter or the coupon below, enclosing $1 for each book wanted. If at any time within 10 days you wish to return the books, your money will be refunded.

charging circuit is closed and the metallized balloon surface electrified, then the air in the vicinity of the balloon receives a powerful electrostatic charge, which acts on the aqueous particles suspended or floating in the air in the manner aforementioned. The inventor has elaborately cared for many problems which might arise in the application of his apparatus, and among other things he describes various forms of high tension uni-directional current generators and means for application against lightning discharges.

The inventor mentions that two or more operating stations for rain production may be used in cooperation, depending upon the observed meteorological conditions, these stations being located at greater or lesser distances apart. In operating multiple stations the degree and sign of the charges used therein, respectively, may be varied as required. The use of ultra-violet rays instead of Röntgen rays for ionizing the atmosphere is discust by Mr. Balsillie in the description of the apparatus, but they are of little practical use, as he points out, for they produce practical ionization effects only when reflected from a fluorescent surface.

EXPERIMENTAL CHEMISTRY.

(*Continued from page 718*)

will contain crystallin deposits. Some of the sublimat will be amorphous.

THE CARBON TEST.—In this the Arsenious Oxid [As_2O_3] is reduced by Carbon [CO being formed] to metallic Arsenic, which sublimes as in Marsh's Test.

HYDROGEN SULFID TEST.—The hydrogen sulfid preciptates arsenious sulfid [As_2S_3] [Yellow] from an acid solution of any arsenious salt

$$2AsCl_3 + 3H_2S = As_2S_3 + 6HCl.$$

Physiological Effects.

Like other arsenical comounds, the oxid is very poisonous, the lethal dose being about 2½ grains, or $^1/_6$ gram. It is called an *Irritant* poison, and acts rather slowly, as the digestive fluids have to transform it before absorption. The antidote is freshly prepared ferric hydrat [$Fe[OH]_3$], together with Magnesia.

$$2FeCl_3 + 3Mg[OH]_2 = 2Fe[OH]_3 + 3MgCl_2.$$

This forms a compound of arsenic insoluble in the fluids of the body, and precipitated in the stomach, etc. An overdose may act as an emetic.

For evidence of arsenical poisoning in post-morten examination of the liver, the stomach, etc., these organs and their contents are sometimes dialyzed before the Marsh and other tests can be applied, in order to separate the arsenic from the viscera and food products. After being treated with Hcl, $KClO_3$, etc., the finely divided substances are put into a dialyzer [a parchment membrane, see Fig. 156], and suspended in water, when the arsenic compounds, being more diffusive, pass thru the membrane in to the water of the outer vessel, leaving the other substances behind. This outer solution is then concentrated and tested for arsenic. Generally, however, the contents with the arsenic are dissolved in aqua regia and then tested by Marsh's or Reinsch's test.

Uses.

It is employed in shot manufacture to give a globular form to the grains.

Cobalt Glance, a compound of Arsenic and Cobalt, has considerable use as fly-poison under the name of *Fly-stone*. Arsenic also finds use in many rat poison compounds.

TESTS FOR ARSENIC.

Marsh's Test.

Experiment No. 148.

Make two constrictions in a tube of hard

BLISS
Electrical School

AGAIN OPEN TO CIVILIANS

FOR A QUARTER OF A CENTURY this institution has been training men for the electrical industries.

SINCE JUNE 15, 1918, the School has been filled to its maximum capacity with soldiers detailed by the WAR DEPARTMENT to receive an intensive course of instruction for electrical positions in the service.

DUE TO THE CESSATION OF HOSTILITIES the War Department has discontinued this work. We will, therefore, resume our CONDENSED COURSE IN ELECTRICAL ENGINEERING, JANUARY 15, 1919. This 26th class will graduate September 17, 1919.

The school is provided with fireproof dormitories, dining hall, excellent laboratories and shops, all thoroughly equipped throughout. A judicious combination of theory and practice results in a well-balanced course.

Because of the demand for admission EARLY APPLICATION is necessary. Catalogue upon request.

glass [about 25 cm. long, and 8 mm. diameter] by the use of a blast-lamp flame. The first capillary should be 5 or 6 cm., from one end, or as near the end as is convenient to hold in the flame; the second one 5 or 6 cm. from the first. These capillaries should not be less than 4 or 5 mm., in diameter at the narrowest part. Between the two constrictions bend the tube upward at an obtuse angle [D]. See Fig. 157. The opposite end of the tube is next fire-polished. When all the parts are cool lay the tube down and draw a file gently across the middle of the constriction nearest the short end, and break it at this point, thus leaving a small opening and completing the tube E. A drying tube 10 or 12 cm long, 8 mm. diameter at each end, with bulb, is filled with calcium chlorid, but not so full as to clog and prevent the gas from passing. This is attached to an Erlenmeyer flask of thick glass [about 125 or 250 cc.] and to the arsenic tube. See Fig. 158. The two-hole stopper of the flask carries a thistle tube. The flask may be raised on an iron ring stand or other support, so as to allow a Bunsen flame, flattened by use of a "wing-top" to heat the arsenic tube, the latter being also supported. Not over 5 grams of arsenic-free [or C. P.] zinc are put into the flask and covered with distilled water. Thru the thistle tube are poured small successive portions of C. P. hydrochloric acid. After letting the hydrogen escape for a minute, to expel all the air from the apparatus, test the gas in the usual way, using the utmost caution to prevent an explosion. When sure that all the air is expelled, ignite the escaping hydrogen. Hold the concave side of a porcelain dish in this flame a minute to test the purity of all chemicals. If no deposit is made, pour into the flask not over 5 cc. of a solution of arsenious chlorid [$AsCl_3$] or of sodium arsenit [Na_3AsO_3]. Put the Bunsen burner under the combustion tube, having the top of the flame near the capillary, but on the side towards the flask. Keep the hydrogen burning well at the end of the tube, adding more hydrochloric acid as needed.

Look for any change of color in the hydrogen flame, and in the event of noting any, try to explain it. Hold a dish against the flame as before. What is the effect, and its explanation. Observe any deposit in the capillary; describe and account for it.

When there is no further deposit near the capillary, and the flame becomes yellow, blow out the hydrogen flame, and when the tube is cool, detach it [*avoid inhaling the fumes*] and pour 3 or 4 cc. of sodium hypochlorit into the arsenic tube, closing the capillary end with the finger. See whether the deposit dissolves. This test serves to distinguish an arsenic deposit from one of antimony, which is insoluble in sodium hypochlorit [NaOCl]. Write reactions for:

1. The action of HCl on zinc.
2. $AsCl_3$ on nascent hydrogen, forming the DEADLY gas arsin [AsH_3].

POPULAR ASTRONOMY.

(*Continued from page 701*)

thruout the equatorial segment of which A-B is a cross-section.

It should be borne in mind in connection with Fig. 1, that space, so far as we know, is without limits. Strictly speaking we should set no boundary for the universe such as is implied when we place a circle around the system of globular clusters. The region beyond A-B is unexplored. The extent of the Galaxy in the direction A-B may be even greater than is represented here. The limits in Fig. I are simply those set by the systems of globular clusters. When the distances of some of the spiral nebulae have been determined it is con-

Become a Doctor of Chiropractic
Advanced Science of Spinal Adjustment

This is the day of drugless healing! In Chiropractic—treatment of disease by spinal adjustment—Science has made a forward step. Look at the newspapers and magazines—note the trend toward the principles of drugless healing, especially Chiropractic.

You can now become a Doctor of Chiropractic through home study during spare time! We teach you thoroughly either by mail or in class. You can know independence and position! Makes no difference where you live or what you do—you should be able to qualify for this great profession. Some of our graduates report that they

Earn $3,000 or More a Year

Dr. M. D. Moore, Ky., writes of having 17 patients in one day at $2 each. Dr. L. H. Roche, New Jersey, $5,550 a year. Dr. A. H. Morrow, of Illinois, reports earning $22 a day. We could name many other Chiropractors who are making good incomes. See the facts in our Free Book. It's only a question of preparation on your part, to enter a profession that is paying others $3,000 to $5,000 or more a year. Think what it would mean to you to earn such an income and to be your own boss with your own hours. Isn't this the kind of life you are desirous of leading? Well, it is now within your reach. Truly this is a chance for you!

Don't Be a Sickly Failure!

STRONGFORT
The Perfect Man

Are you dragging yourself about from day to day, always tired and dispirited; suffering from backache, indigestion, constipation; your billiousness showing in your face, your lack of energy in your eyes, your good-for-nothing physical conditon in the hang-dog air with which you meet your fellowmen? Have you about given up hope—and has your wife given up all hope—that you will ever get a h e a d and amount to anything in the world?

Pull Yourself Together!

Brace up! There's a way out! You can be a man again. You can be full of life and energy and good health, you can trample under foot the sickly troubles that are pulling you down; you can change the watery fluid in your veins to sparkling red blood, that will nourish mind and body, overcome all your ills, and put you at the top of the heap.

No matter what brought you to your present condition; no matter how low you have sunk; you can be RE-BUILT into a MAN, with health and strength and mental and physical vigor and efficiency.

It's Never Too Late

Strongfortism doesn't know the meaning of the words "too late." No matter what your age or condition; no matter how long you have been mired in the slough of despondency or struggling under the handicap of physical irregularities, Strongfortism can make a new man of you. Strongfortism can improve every part of your system; strengthen your heart, lungs, liver, stomach; clear your brain; steady your nerves, rid you of that eternal languid, tired feeling and start you on the path to success.

I Can Re-Create You

I KNOW that I can make you over, can improve you 100 per cent., because I have helped and am helping thousands of other men—some of them pretty far gone, too, before they took up Strongfortism. I have no pills, powders or patent medicine dope to offer you; no drugs of any kind. EXPERIENCE instead; the solid experience of a lifetime with myself and my pupils; the experience and study that have enabled me to dig out and apply to you the secret laws on which human health and happiness and vitality depend.

Send for My Free Book

"Promotion and Conservation of Health, Strength and Mental Energy" tells you all about Strongfortism; tells you how you can overcome your mental and physical ailments; how you can strengthen your vital organs; how to attain symmetry of form and figure. It's forty-eight pages of talk straight from the shoulder, telling how you can get the most pleasure out of life, from a man who knows what he's talking about.

Mark the coupon below, showing what ailments you suffer from and send it with three 2c stamps to cover mailing expenses and I will send you the book free.

ceivable that the limits of the celestial sphere may be still further extended or modified. At present our tentative diagrams of the universe must be in accord with the extent of our knowledge at this time, just as the maps of the world and of our solar system drawn several centuries ago were representative of the state of man's knowledge in that age.

The theory that the structure of the Milky Way resembles a spiral nebula we have considered in a recent article on the *"Spiral Nebulae."* The laws governing the motion of bodies in a spiral formation are not yet known, but the star streams that exist within and parallel to the galactic plane may be manifestations of the workings of such laws. New methods of attacking the complicated problem of the structure of the universe and the movements of the stellar bodies are constantly being devised and perfected. The advance of astronomy in this direction has been very great in the past few decades, and a rapid increase of our knowledge in this direction is to be expected.

The center of the complete galactic system has been located according to Dr. Shapley's investigations of the globular star clusters in the direction of the richest star clouds of

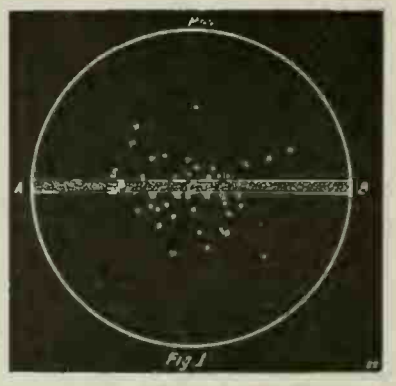

Fig. 1, Above, Shows a Section of the Celestial Sphere made by a Plane Perpendicular to the Plane of the "Milky Way." The Crosses Represent the Positions of Some of the Globular Star Clusters Projected Upon this Plane. The Equatorial Section A-B is 12,000 Light Years in Width and 300,000 Light Years in Diameter. Midway Between its Upper and Lower Limits Lies the Plane of the "Milky Way," the Pole of Which is at P. C Marks the Center of the Entire System, and the Globular Clusters are Distributed Symmetrically with Reference to this Point

Sagittarius, near the boundary of *Scorpio* and *Ophiuchus*. If there is a central nucleus of the Galaxy, it is to be looked for in this general direction which is also the center of the system of globular clusters, which are symmetrically distributed around this position (marked C in Fig. 1) above and below the plane of the Milky Way. In this direction also lies the vertex of one of the two star streams, the majority of the loosely-formed star clusters, the planetary nebulae and the peculiar Wolf-Rayet stars. It is also the region most conspicuously avoided by the spiral nebulae.

Our own solar system is situated well within the equatorial segment of the universe. It is to be found about half way from the center to the edge of the Galaxy (see S in Fig. 1) and is fully *sixty thousand light years* distant from the center of the complete system situated in Sagittarius, and only thirty light years above the central plane of the segment. It is simply one of the stars of the Milky Way, one of the numberless units of the universe. The nature of its journeyings to and fro within the limits of the equatorial region, granted that its travels are thus limited, will not be known until more is discovered regarding the details of the structure of the Milky Way and the laws that control the motions of its various members. Why the great majority of all the stars, as well as the

gaseous nebulae, remain closely confined to these equatorial regions, leaving to the immensity of undefined space beyond, vast and complicated systems such as the Magellanic Clouds the globular clusters and the spiral nebulae, is a problem still unsolved as is also the cause of the tremendous velocity, averaging a thousand miles per second, that is characteristic of all objects beyond the immediate vicinity of the Milky Way.

Whatever may prove to be the form and structure of the Milky Way, it is, according to all that has so far been discovered, of fundamental importance in the plan of the universe and exerts an influence over vast and massive systems situated far exterior to it.

(The next installment will appear in an early issue.)

A USEFUL ELECTRICAL LABORATORY SWITCH-BOARD.

(Continued from page 715)

are fifteen contacts and they should be spaced about ⅛" apart. The construction is shown in Fig. 8. The rods in both the transformer slide and the rheostat are mounted on a hardwood or fiber block, the dimensions of which are shown in figure 9. The rod is fastened to the block by means of screws or by a long pin thru the entire rod and block. The handle is fastened by bending a piece of brass as illustrated in the side-view. The contacts are six in number and are ⅛" thick 1" long and ¾" wide. Fasten to the marble with No. 8—32 flat-head machine screws countersunk into the contacts. Make them extend far enough behind the board to serve as connections. Therefore the heads must fit snugly because they will have to carry 60 amperes of current.

Next we will take up the construction of the transformer. The dimensions are given in Fig. 6. The core is built of No. 28 sheet iron or stove pipe iron will do. The pieces are cut 5" x 1¼" and 2¾" x 1¼". Use enough to build a core 1¼" thick when compress. The primary for 110 volts consists of 580 turns, 290 turns on each leg, of No. 18 D.C.C. magnet wire

The secondary consists of 180 turns of No. 14 or better No. 12 D.C.C. Taps are brought out for 1 volt at the fifth turn and at every additional five turns until the tap for 10 volts is brought out. Then bring out taps at the 60th turn, the 90th, 120th, 150th, and 180th turns. These are connected to the transformer contacts and the beginning of the coil is connected to one side of the plug receptacle. The other side of the plug receptacle is connected to the brass rod. But the transformer must be mounted first. Figure 7 shows how this is done.

The rheostat is made by winding No. 18 iron wire on 6 wooden cylinders three inches in diameter and 12 inches long. Wind 29 ft. of wire on each. Use nails or screws to start and end the winding. Connect in series and immerse in water. Tap the iron wire connections between each coil by using a heavy copper wire and be sure to let the copper wire make connection below the water. If the water gets too low the wire will almost instantly melt if it is carrying full load of 50 or 60 amperes. The connections are much the same as those of a starting box. Connect one side of line to rod and the other side to the 50 ampere stage plug. Then connect other terminal of stage plug to last lead of rheostat and connect the first terminal or beginning of first coil to contact No. 1, beginning of second coil to second contact, etc.

The main-line wires must be No. 1. This wire is expensive, therefore the switchboard must or rather should be near the entrance cut-out.

A 100 ampere current at 110 volts is 11 K.W., and this means the transformer supplying your house must be of that capacity.

DRAWING
Big Pay—Easy Pleasant Work

Draftsman earn $150.00 to $300.00 a month. The work is pleasant and the hours are short.

You can get this big pay too. All you need is the new 1919 edition of the Cyclopedia of Drawing and a little of your spare time. The cost is only 7 cents a day, and we give a year's consulting service free. See the FREE examination offer below.

Cyclopedia of DRAWING

4 big volumes each 6½x8¾ in., bound in genuine American Morocco and trimmed in gold 1678 pages and more than 1000 illustrations plates, diagrams and blue prints.

The only books that thoroughly cover Mechanical, Structural and Architectural Drafting in a non-technical way. You don't have to know anything about the subject to understand them. They begin at the beginning and tell you everything about Blue print Reading—Mechanical Drawing—Machine Design—Machine Drawing—Structural Drafting—Architectural Drawing and Lettering—Shades and Shadows—Perspective Drawing—Freehand Drawing—Pen and Ink Rendering—Typographical Drafting—Drawing Instruments and Their Uses and hundreds of other things connected with the work.

Use One WEEK FREE!

A Sample of What You Can Do With This Outfit

This illustration, made from an actual photograph, shows only a very few instruments that can be made with the Boy's Electric Toys: Electric Pendulum, Electric Telegraph, Current Generator, Electric Dancing Spiral, Galvanometer, Space does not permit us to show the hundreds of experiments that can be performed with this wonderful outfit.

The outfit contains 114 separate pieces of material and 24 pieces of finished articles ready to use at once.

Among the finished material the following parts are included: Chromic salts for battery, lamp socket, bottle of mercury, core wire (two different lengths), a bottle of iron filings, three spools of wire, carbons, a quantity of machine screws, flexible cord, two wood bases, glass plate, paraffine paper, binding posts, screw-driver, etc., etc. The instruction book is so clear that anyone can make the apparatus without trouble, and besides a section of the instruction book is taken up with the fundamentals of electricity to acquaint the layman with all important facts in electricity in a simple manner.

We guarantee satisfaction.

The size over all of the outfit is 14x9x2¾. Shipping weight, 8 lbs. **No. EX2002 "The Boy's Electric Toys," outfit as described. $5.00**

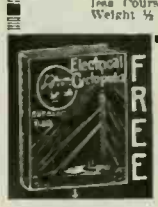
IMMEDIATE SHIPMENTS

No. EX2002

THE BOY'S ELECTRIC TOYS" contains enough material TO MAKE AND COMPLETE OVER TWENTY-FIVE DIFFERENT ELECTRICAL APPARATUS without any other tools, except a screw-driver furnished with the outfit. The box contains the following complete instruments and apparatus which are already assembled:

Student's chromic plunge battery, compass-galvanometer, solenoid, telephone receiver, electric lamp. Enough various parts, wire, etc., are furnished to make the following apparatus:

Electromagnet, electric cannon, magnetic pictures, dancing spiral, electric hammer, galvanometer, voltmeter, hook for telephone receiver, condenser, sensitive microphone, short distance wireless telephone, test storage battery, shocking coil, complete telegraph set, electric riveting machine, electric buzzer, dancing fishes, singing telephone, mysterious dancing man, electric jumping jack, magnetic geometric figures, rheostat, erratic pendulum, electric butterfly, thermo electric motor, visual telegraph, etc., etc.



This does not by any means exhaust the list, but a great many more apparatus can be built actually and effectually.

With the instruction book which we furnish, one hundred experiments that can be made with this outfit are listed, nearly all of these being illustrated with superb illustrations. No other materials, goods or supplies are necessary to perform any of the one hundred experiments or to make any of the 25 apparatus. Everything can be constructed and accomplished by means of this outfit, two hands, and a screw-driver.

The "Electro" Radiotone

HIGH FREQUENCY SILENT TEST BUZZER

This instrument gives a wonderful high pitched MUSICAL NOTE in the receivers. Impossible to obtain with the ordinary test buzzer. The RADIOTONE is built along entirely new lines; it is NOT an ordinary buzzer, reconstructed in some manner. The RADIOTONE has a single fine steel reed vibrating at a remarkably high speed, adjusted to its most efficient frequency at the factory. Hard silver contacts are used to make the instrument last practically forever.

Yes, the RADIOTONE is SILENT. In fact, it is so silent that you must place your ear on top of it to hear its beautiful musical note.

You will be astounded at the wonderfully clear, 500 cycle note, sounding sharply in your receivers. To learn the codes, there is absolutely nothing like it. With the radiotone, a key and one dry cell and ANY telephone, a fine learner's set is had. Two or more such sets in series will afford no end of pleasure for intercommunication work. **Shipping Weight 1 lb.**

Radiotone as described.....each **$.90**

IMMEDIATE SHIPMENTS

The "Electro" Telegraph

is not a toy, but a practical, honestly built telegraph outfit, which not only sounds but works like the big commercial instruments. By studying the code for 30 days you can become a first-class telegraph operator. Such operators are in big demand now. Outfit consists of TWO complete telegraph instruments each measuring 3½ x 2½ x 2¼. All metal parts are highly nickel plated, including key lever. Note hard rubber knob. Telegraph Code Chart, telegraph blanks and connecting wire comes with set, but no batteries. Outfit works on 2 dry cells (one cell for each instrument). The "Electro" is the ONLY Outfit that works both ways, each station can call; no switches, no extras. Nothing to get out of order. Guaranteed to please you or money back. **Price Complete as Illustrated (TWO INSTRUMENTS)..... $1.25**

Shipping Weight, 2 lbs.

IMMEDIATE SHIPMENTS

The "Electro" Codophone (*Patents Pending*)

What this remarkable instrument is and does.

$1.50

The "Electro" Codophone is positively the only instrument that will imitate a 500 cycle note exactly as heard in a Wireless receiver. The loud-talking receiver equipped with a horn, talks so loud that you can hear the sound all over the room, even if there is a lot of other noise.

THAT'S NOT ALL. By loosening or tightening the receiver cap, a tone from the lowest, softest quality, up to the loudest and highest screaming sound can be had in a few seconds.

FOR INTERCOMMUNICATION. Using two dry cells for each instrument, two Codophones when connected with one wire and return ground, can be used for intercommunication between two houses one-half mile apart.

One outfit alone replaces the old-fashioned learner's telegraph set, consisting of key and sounder.

The "Electro" Codophone is a handsome, well made instrument, fool proof, and built for hard work. Contacts are of hard silver ⅛ inch in diameter, that will outlast the instrument.

There is also a neat code chart and full directions enabling any intelligent young man or girl to learn the codes within 30 days, practising one-half hour a day.

Sizes: 6¾ x 3 x 2¾". Shipping weight, 2 lbs.

The "Electro" Codophone as described, complete..... **$1.50**

MT. WILSON'S HUNDRED-INCH TELESCOPE.

(*Continued from page 703*)

detailed description of the process of figuring the mirror. Roughly speaking it may be divided into two stages. In the first stage the mirror was brought to a spherical figure; in the second this spherical form was charged to paraboloid. The second process tho requiring much less time than the first involved very great care and frequent optical tests to avoid the introduction of zonal errors. The largest deviation of the paraboloid from the sphere in the case of this mirror is only one-thousandth of an inch. All of the optical work, with the exception of the first rough shaping, was carried on with wooden tools of various sizes and forms, and the use of rouge and distilled water as the polishing material.

After the completion of the mirror a series of photographic tests was made to determine the accuracy of its figure. These showed a remarkably high degree of perfection, every portion of the surface having the same focal length to within one part in about 90,000.

A few figures may be of interest in this connection. The finished mirror weighs *4½ tons*, about one ton of glass having been removed in the process of shaping and figuring. Its diameter is closely 101 inches, and its thickness at the edge 13 inches. The depth of the curve at the center is about 1¼ inches. The focal length of the mirror is five times its aperture, or 42 feet. A direct photograph of the moon at this focus, accordingly, would have a diameter of 4.4 inches. As in most modern reflecting telescopes the 100-inch reflector will be provided with two small convex mirrors to be attached to the upper end of the tube, either of which may be utilized to increase the focal length in much the same way as telephoto lenses are used in ordinary photography. With these mirrors focal lengths of 134 and 251 feet may be obtained and the magnification correspondingly increased.

As soon as the optical work upon the mirror disk was fully under way the design of the telescope mounting was begun. In view of the great size and the immense weights involved the "closed fork" type was finally adopted. In this form of mounting the telescope tube is hung in the center of a rectangular frame of massive steel girders, the bearings providing for north and south movements of the tube being built into the two side members. The entire rectangle is mounted on bearings at top and bottom, which furnish the east and west motion of the telescope. To relive friction the system of *mercury flotation* used most successfully for the 60-inch reflector is employed, there being two large steel floats and corresponding mercury tanks, one at either end of the rectangular axis. These floats carry about 98 per cent of the moving parts of the telescope, or some 90 tons, the remaining two per cent being carried by two large spherical defining bearings. The instrument is controlled by electric motors, which provide for three rates of speed in both north and south and east and west directions.

The driving clock which moves the telescope at a uniform rate corresponding to the rotation of the earth is placed within the concrete pier which supports the instrument and near the south end. The driving shaft extends from the clock and meshes with a worm wheel 17 feet in diameter, which is attached to the telescope axis.

The building and dome which enclose the telescope form a steel structure 100 feet high and 95 feet in diameter. The walls and roof are double thruout to admit of the free circulation of air, and thus help to equalize the temperature within the building. The shutter is of the double section type, divided in the center, and when fully open provides an aperture 20 feet wide. Like the observing platform, the crane hoist and the dome mechanism, it is operated by electric motors. The dome is mounted on 24 four-wheeled trucks running on specially ground rails, and power is applied by two driving trucks at opposite sides. When rotated the motion of the dome has been found to be remarkably smooth and free from vibration in spite of the great weight involved, which is approximately 600 tons.

Wanted—Railway Mail Clerks

$1100 to $2000 Year

Common Education Sufficient

Sure Pay, Life Job. Pull Unnecessary.

Age 16 to 40

YOU HAVE A BEAUTIFUL FACE

BUT YOUR NOSE?

BEFORE AFTER

IN THIS DAY AND AGE attention to your appearance is an absolute necessity if you expect to make the most out of life. Not only should you wish to appear as attractive as possible, for your own self-satisfaction, which is alone well worth your efforts, but you will find the world in general judging you greatly, if not wholly, by your "looks," therefore it pays to "look your best" at all times.

Permit no one to see you looking otherwise; it will injure your welfare! Upon the impression you constantly make rests the failure or success of your life. Which is to be your ultimate destiny? My new *Nose-Shaper*, "TRADOS" (Model 24) corrects now ill-shaped noses without operation, quickly, safely and permanently. Is pleasant and does not interfere with one's daily occupation, being worn at night.

Write today for free booklet, which tells you how to correct ill-shaped noses without cost if not satisfactory

M. TRILETY, Face Specialist **1038 Ackerman Bldg., Binghamton, N. Y.**

Dear Sirs:

It certainly was SOME RESULTS.
I've almost worn out a good typewriter.
Just about exhausted myself writing.
Used all the paper in this part of America.
And about "Gone Busted" buying postage stamps.

Now, I'm a-goina quit, and will never do it again, or at least I won't promise to answer all the letters I received from an Ad that I put in the "E. E."

The letters are still coming in.—The apparatus advertised has long since been sold. Every piece of it, The letters are from all over the United States, AND ELSEWHERE. Received one today from Shangbai, China. Can you beat that. I'm enclosing the letter from China.

It's a great life, if you don't weaken.

I wish to THANK the "E. E."—Some circulation.

Very Respectfully,
G. R. SMATHERS,
403 N. Brevard St., Charlotte, N. C.

Dont Send a Penny

Here's the biggest bargain in boys' shoes you'll find anywhere. To prove it we will send you a pair without a penny of advance payment. Just send your name and address. We ship on approval so you can compare them with other hi-top shoes costing as much as $6 or $7. You know how hard boys are on shoes. These are made for just that kind of wear—to stand up under the hardest knocks a boy can give them, and you'll find these will outwear three ordinary pair. Prove it at our risk. Keep them only if satisfied. If not satisfactory, return at our expense.

Boys' Special Hi-Tops

Don't Miss This Chance

Make your boy proud and happy and keep his feet dry and warm with a pair of these wonderful Hi-Top Shoes. See how strongly they are made. Solidly made of strong wear-resisting retanned leather. Two buckles and straps fasten closely around leg. Lace Blucher style on comfortable wide last—full round toe. All seams strongly sewed. Extra heavy solid leather soles and heels, to stand the hardest wear. Tan only. Sizes 1 to 6.

SEND no money—just your name and address. See if you can find their equal for $6 or even $7. Pay **$3.90** for shoes on arrival. If not satisfactory, return them and we will refund your money. Be sure to state size wanted. Order by No. X17029. Send your order today. No risk to you.

LEONARD-MORTON & CO., Dept. X553 Chicago

Here's the New Auto-Wheel Book-Free

Write for Your Copy Today

IT'S A BOOK brimful of information a boy ought to have. It tells you how to organize an Auto-Wheel Coaster Club—how to make money with your Auto-Wheel—how to have most fun when camping and what to do in case of accident. It's a valuable book—and it's yours for the asking.

Get a Free Felt Pennant

We want to tell you all about the wonderful Auto Wheel Coaster and the patented Auto-Wheel Convertible Roadster—and to send you one of our beautiful Felt Pennants FREE. When you write for the Auto-Wheel Book give us the names of three coaster wagon dealers, mentioning which one handles the Auto-Wheel, and we'll send you a complete Auto-Wheel Catalog and the Pennant, FREE. WRITE US A LETTER TODAY. Address,

Buffalo Sled Company,

163 Schenck St., N. Tonawanda, N.Y.

In Canada: Preston, Ont.

INDEX to Volumes 1, 2, 3, 4, 5

ELECTRICAL EXPERIMENTER

Postpaid **15c**

Experimenter Publishing Co., 231 Fulton St., N. Y. City.

EXPERIMENTAL CHEMISTRY.

(*Continued from page 751*)

3. The burning of hydrogen.
4. Burning of arsin.
5. Breaking up of arsin by heat. The solution of arsenic in sodium hypochlorit gives.

6. $2As + 5NaOCl + 3H_2O = 2H_3AsO_4 + 5NaCl$.

In the same manner as above, test some solution imagined to contain arsenic.

Experiment No. 149.

Perform an experiment using $SbCl_3$ solution in exactly the same way as the $AsCl_3$ was used, and compare the results. Pay particular attention to the difference between Sb and As in position of deposit, in color, and in solubility in NaOCl.

Reinsch's Test.

Experiment No. 150.

Pour into a dish 3 or 4 cc. of a solution of arsenious chlorid [$AsCl_3$] or sodium arsenit [Na_3AsO_3] acidified with hydrochloric acid. In this solution place a strip of bright copper foil [about 3 cm. x 4 cm.] and boil the liquid for three or four minutes,—longer, if no discoloration of the copper appears.

What is the color? No change in the copper indicates absence of arsenic. In that case add more HCl and boil again. If the copper is finally discolored, take it from the liquid with the forceps, rinse it carefully, and press it lightly between the folds of filter paper to remove moisture. Then cut it into small strips with scissors; drop these strips to the bottom of a long and narrow test tube, and slowly heat the lower part of the tube.

See whether the copper changes color. Look for a sublimat. State its color; its position. Is it in color and appearance like the sublimat in Marsh's test? Compare it with metallic arsenic, arsenious oxid, etc. Examine the sublimat under a microscope, breaking the tube and scraping off a little for this purpose. Is it crystallin or amorphous?

Experiment No. 151.

Make arsenious sulfid [As_2S_3], wash it free from impurities, dry it and put it away for future use.

Experiment No. 152.

Ascertain by experiment a solvent for arsenious sulfid [As_2S_3]. Try [NH_4]$_2$ CO_3.

Experiment No. 153.

Make Paris Green [$Cu_3[AsO_3]_2$], wash, filter and dry, and put away for use.

Experiment No. 154.

Make arsenious oxid [As_2O_3], using not over ½ gram.

Experiment No. 155.

See whether As_2O_3 is at all soluble in water.

Examine the various compounds of arsenic with special regard to colors—red, yellow, green, and white—and attach names.

(*To be continued*)

JAPAN HAS WIRE-WIRELESS CENTRAL.

An exchange to wireless and wire telephones is to be establisht in Kobe very shortly by the Government Department on Communications. A wireless tower 180 feet high is now being erected in front of the largest of the Kobe telephone exchanges. Wireless telephone messages from vessels within 100 miles of the South Japan port will be connected by "Are you there?" girls with the telephones of subscribers in Kobe, Osaka, Kyoto and neighboring cities, thus serving the most densely populated section in Japan.

GREATEST TOY SENSATION OF THE DAY!

FIGHTING DREADNAUGHT

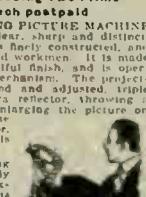
SENSATIONALLY REALISTIC!!!

Here is a model of Uncle Sam's fighting monsters. Eight big guns, each of which flashes, at correct intervals, from twelve to twenty times. Extra ammunition always obtainable Absolutely harmless. Can be operated indoors or out. Now boys, Here's your chance to own a battleship to actions, as the best of it is you can OWN the ship and command the fleet yourself! By having two or more Battleships, you can stage EXCITING NAVAL BATTLES in your own home. Extra Ammunition, Wireless and Ammunition, 15c, three for 40c, or a fleet of 1 ships for $1.50 postpaid. Extra ammunition, 8 cents per doz.

Boys, you can have Movies at your own home with this latest model

MOVING PICTURE MACHINE

Uses Standard Films same as the larger machines. Very easily managed. Simply turn the handle. Good Variety of Films always obtainable



PRICE Complete ONLY **$2.50** Postpaid anywhere including Two Films

Extra Films, 15c each postpaid

THIS IS A GENUINE MOVING PICTURE MACHINE and the motion pictures are clear, sharp and distinct. The Moving Picture Machine is finely constructed, and carefully put together by skilled workmen. It is made of Russian Metal, has a beautiful finish, and is operated by a finely constructed mechanism. The projecting lenses are carefully ground and adjusted, triple polished, standard double extra reflector, throwing a ray of light many feet, and enlarging the picture on the screen up to three or four feet in area. The light is produced by a safety carbide generator, such as is used on the largest automobiles. This throws a dazzling white light on the screen.

It is a solidly constructed and durable Moving Picture Machine. The mechanism is exceedingly simple and is easily operated by the most inexperienced. The pictures shown by this marvelous Moving Picture Machine are not the common, crude and lifeless Magic Lantern variety, but are photographic reproductions of actual scenes, places, and people which never tire the audiences. This Moving Picture Machine has caused a rousing enthusiasm wherever it was used.

JOHNSON SMITH & CO.
Dept. E 3, 54 West Lake Street, CHICAGO

"The Baby" Double Action Hammerless Revolver

A HANDSOME AND MOST EFFECTIVE WEAPON

$5.50 Measures but 4½ inches long

Takes regular .22 calibre cartridges

The new Baby Double Action Hammerless Revolver has been produced to meet the ever increasing demand for a revolver that would combine small size and small in size, yet is just as effective and serviceable as the most expensive weapon sold there is no safer or better one made than this. A great feature is its safety action that guards against accidental discharge, even when it is quite safe to pull the trigger. The illustration gives an idea of its appearance, but it must be seen to be appreciated. The ammunition used is the .22 short (short) cartridge obtainable anywhere, or you may obtain the cartridges from us (cartridges can be shipped only by express). The revolver is only $8.50, sent by mail postpaid to any address. JOHNSON SMITH & CO.

TOOTH-ACHE STOP

Stops the Pain, Stops the Tooth

Squeeze a little on before each meal. The Ache Stops instantly; the pain's hardened forming an antiseptic filling. Absolutely harmless. Will make it ready for the next bad attack. 25c per tube, postpaid.

"SAFETY 1st" PINS

A clever novelty. The National Safety Friend. Convenient for those times very popular. Wear one and show your sweetheart with the movement. Also handy for wearing at amateur theatricals and the like. Two pins in gold-plated and 10c in nickel-plated. 6c each, two for 10c p. pd.

Mysterious Ghost

This is not a pretty object, but there is no fear of any people who has practical ideas. The Ghost, when disguised in a perfectly dark place, glows with a ghastly cold bluish radiance, very startling and a "creepy" sensation even when you know all about it. But a regular shocker for those who come upon it unexpectedly. A great joke to play on your mother in the dark. Price only 15 cents each, or three for 40 cents.

INKLESS PEN

WRITES with WATER 600 words from one filling. Writes as well as you did. Makes its own ink. Astonishingly clear. Better than cheaper fine fountain pens. Will last long time with no dip in glass water. No trouble—no bother—no expense. A pleasure to use. With Nickel Plated Reservoir Holder 15 CENTS. 3 for 25c

SIMPLEX TYPEWRITER ONLY $2.50

Cheap But Good. So Simple a Child Can Use It. We Guarantee the Writing.

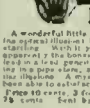
Though so marvelously cheap, the machine is a thoroughly practical Typewriter. It is quite as easy to use it to produce writing equal to your request to that of any $1.00 machine. It can't go wrong—there is no ribbon to get out of order, and you will be surprised. With reasonable care, it will last a lifetime. It is so simple that a child just able to read and write can learn to operate it in a few minutes, and an hour's practice will make you an expert operator. Every business man should have a typewriter. It typifies and writing is indispensable and crowds the important on that the time is wasted. Every one of the business men of the world uses a typewriter. We give you the best for the least money. Prices range from $50 to $100. Our machine is fully described in this issue, and is the equal of any $1.00 machine. It can do nearly all the work that the $100 machine can do. The letters at the alphabet, the numerals 1 to 10, and punctuation marks are so arranged that the letters most used are nearest the center, thus enabling you to write rapidly. The rollers hold the paper in position while writing and at the end of each line a slight turn of the roller moves the paper up one space, which makes a clear and forces the paper forward, giving the proper line space. So that it is never necessary to use more than one hand in order to write. Each typewriter packed in a strong box, with full printed instructions for use. Price complete, $2.50 postpaid.

Johnson Smith & Co., Dept. E 3, 54 W. Lake St., Chicago.

SQUIRT RING

You may have a lot of fun with the Squirting Ring. Expert Ring. It resembles a hard-rubber, is gotten ring, attached to a rubber ball, as shown and that the latter is quite out of view when the ring is on. The proper position both as attaching ring and ball is the secret. It will be the center of attraction. While the victim is accosted in an easy social manner, you just squeeze the rubber ball and the observer appearance, a very great surprise. Price 2 for 25 cents, or 15c each, postpaid. J. S. & CO.

Wonderful X-Ray Tube



A wonderful little instrument producing optical illusion both surprising and startling. With it you can see, as apparently the bones of your fingers the hand in a large glass tube, the flesh appearing in the pale color, and many other similar illusions. A mystery that will have been able to satisfactorily explain Price 10 cents each, 2 for 15 cents, or dozen, 75 cents. Sent by mail, postpaid.

Sneezing Powder

Place a very small amount of this powder on the back of your hand and blow it into the air, and everyone in the room or even without leaving the room—ah. It is most amusing to hear them sneeze, but they never suspect the real reason, but think for a moment it came from the other. Interest the laughing and everyone will be having the time of your life. For parties, holiday entertainments, or any place at all where there is a gathering of people it is the greatest joke ever played. Price 25c a box, 3 for 50c. JOHNSON SMITH & CO.

STAGE MONEY

With a bunch of these bills it is easy for anyone to act the part of a millionaire or prosperous. By flashing a roll of these bills at the right moment, or by the use of a genuine bill at the front of the roll, the effect is startling. Many will be fooled to be all just the genuine. Price 25c a 100 bills, 50 bills 25c, 125 for 50c, or $1.50 thousand.

NEW BOOK ON ROPE SPLICING

USEFUL KNOTS, HITCHES, SPLICES, ETC.

Men Different Knots Are Made and What They Are Used For. Knots to Use and Knots to Avoid.

A good practical handbook giving complete and simple direction for making all the useful knots, hitches, rigging splices, etc. over 100 illustrations. All about wire rope attachments, lashings, tackles, etc. 32 Heraldic Knots illustrated (of great value to mechanics, riggers, campers, boatmen. Price 20c postpaid.

Johnson Smith & Co., Dept. E 3, 54 W. Lake St., Chicago

LUMINOUS PAINT

Make Your Watches, Clocks, Etc., Visible by Night

The very latest discovery in the way of luminous paint. Can be applied to any surface, and when exposed to daylight for a few minutes will remain luminous for hours. Apply it to the hands and figures of your watch, clock, or to the door. THE BRIGHTEST PAINT MADE. Quite a little applied to the dial of your bedroom clock will enable you to tell the time by night. Try one on the door, or other articles made of wood, electric lights, match boxes, and innumerable other purposes. Long time Luminous Paint, 15c a bottle, 2 bottles for 25c, postpaid. Johnson Smith & Co., Dept. E 3, 54 W. Lake St., Chicago

MUSICAL KAZOO

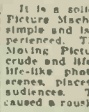
With the Musical Kazoo you can, without practice, play any piece you have ever heard of, imitate any kind of instrument, and sing a tune at the same time. Simply hum or whistle a tune, and the Kazoo will instantly reproduce it, adding a peculiar quality to the tone that is very pleasing. Price 10c each, postpaid. Special offer: 3 for 25c, postpaid.

MAGIC FLUTE

Wonderfully Sweet Toned and Musical

A marvelous musical instrument. Makes music, whether blown by the performer or by the voice. Can play scales, tunes of a chromatic harmonica fast, and close enough can be played upon the Humana Kazoo. Don't be disappointed. It is a scientific self-playing instrument. When properly used a great performance, or an other musical instrument, the effect is wonderful. Full printed instructions for playing sent with each instrument.

Post Paid 15c



Price $1.50 per dozen. Postage 10c extra.

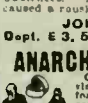
JOHNSON SMITH & CO., Dept. E 3, 54 W. Lake St., CHICAGO

ANARCHIST BOMBS



Consists of a little glass vial, containing in liquid form a chemical which will produce a very horrible odor. One dropped in a room full of people will cause more consternation than a limburger cheese. The smell will entirely disappear in a short time. 3 Boxes for 25c, shipped by express only with a Dollar's worth of other merchandise.

ITCHING POWDER

This is another good practical joke; the intense discomfiture of your victims to every one who tries it. Perfectly harmless, but thoroughly enjoyable. All that is necessary to start the ball rolling is to deposit a little of the powder on a person's clothing and the powder can be relied upon to do the rest. It will result in a vigorous scratch, then some more scratch, and still more scratch. Price 10c each, 3 for 25c. Sent postpaid by express or mail, or order at least One Dollar's worth of other merchandise.)

INVISIBLE INK

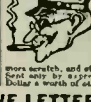
The most confidential messages can be written with this ink, for the writing is INVISIBLE MARK. Cannot be seen, unless you know the secret. Invaluable for many purposes. In daily use in offices and other private memorandums, and for many other purposes. Great fun for pressing practical jokes. Only 15c Bottle

LOVE LETTER INK

Writing written with this remarkable ink vanishes entirely in a few weeks (sooner if desired), leaving the paper QUITE BLANK. 15c p. pd.

LUMINOUS INK Writing can be READ QUITE PLAINLY IN THE DARK. Writing entirely disappears in daylight. Great fun for passing like fire. Quite invisible at daytime. Full directions with each bottle; 2 for 40c postpaid.

JOHNSON SMITH & CO.

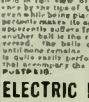


MULTIPLYING BILLIARD BALLS

The Best Feat of its Kind

This trick is an effective one, and a surprising one. The performer stands around the ball for exhibition, and apparently has a thousand in his hands. It is really very simple, and consists of a few balls held between the fingers and a second ball concealed in the palm of the hand. The balls are held in full view of the audience, and the balls of the fingers of the left hand, and even while being placed in position, another ball unapparently appears in its appearance, apparently suffers from some kind of spasm and out another ball is the result. The first can then be performed, the balls disappearing one after another until none remain. It is a very interesting trick that is quite easily performed by following the directions and necessary the apparatus. Price complete, 25 cents. POSTPAID. JOHNSON SMITH & CO.

GOOD LUCK RING

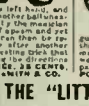


Genuine and Novel. A VERY striking and unusual ring, made of gunmetal finish, in a skull design, with two brilliant red eyes that sparkle out of the darkness of the ring, thus falling any object to which it may be sold. Be sure to send Size of Ring. Lots to the wearer. Price 15 cents each, 2 for 25c, postpaid.

guarantee that it is certainly a very unique ring and we will take a pride in seeing that you get what you want. This is a special bargain we will supply the ring at the above price, postpaid. HALF PRICE. Price, ONLY 25 CENTS. POSTPAID. JOHNSON SMITH & CO.

ELECTRIC INSOLES

Comforting to the Feet and Healthy



You probably suffer from Cold Feet and have you ever spent Electric Insoles in a right shoe, composed of copper and zinc generate a current of electricity constant circulation of the blood and heat to the feet. Positive cure for Chilblains, Sweaty Feet, Rheumatism and Cramps. Sent postpaid for 50c a pair.

JOHNSON SMITH & CO. (Dept. E3), 54 W. LAKE STREET, CHICAGO

THE "LITTLE GIANT" TYPEWRITER

A First Class Writing Machine For $1.25

A toy, yet little typewriter for $1.25. There is absolutely no fake about this machine—it does all the work that a $100 machine does, and is a typewriter that anyone can use. It is simple in construction, so that any one can quickly learn to operate it. It is a practical machine and is fully equipped with a full set of the alphabet, most frequent words being so grouped as to enable one to write rapidly, the numerals 1 to 0, and the usual punctuation marks being together. With this machine you can send your best love letters, address envelopes, make out bills, and do almost any kind of work not requiring a large expensive machine. With each typewriter we send a liberal supply of paper and full printed instructions for using the machine. Price complete $1.25 by mail postpaid.

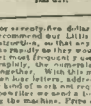
SERPENT'S EGGS

Each box contains 12 Eggs, which are no larger than a grain of oats. When lit with a match, however, each one gradually hatches itself into a Snake several feet long, which curls and twists about in most wriggly manner. Price per box 10c, postpaid. Johnson Smith & Co.

MYSTIC SKELETON

A jointed figure of a skeleton 14 inches in height, will dance to music and perform many gyrations and contortions and more notable who operates it. It is a great novelty and will cause much amusement. The figure may be examined by the spectators. When handed back to the operator it is suspended by a cord to a chair or table, when it will perform its dance, and will move about in a most grotesque manner. At the command of the operator it will bow, salute, stand up, dance, etc. It is very amusing with each Skeleton, 17 the old of which anyone can readily make it perform. 10c postpaid.

CIGARETTE ROLLER



Very neat and handy. Weighs less than a quarter of a pound. It makes better cigarettes than you can buy and makes them easily and quickly. You can use just the tobacco you prefer and not the sticky "cigarette" smoke" than ready made, and more of them for the same money. Just try one and make your cigarettes just to your own liking. Price only 10c or 3 for 25c postpaid, with full instructions for use. JOHNSON SMITH & CO.

MIDGET ILLUSTRATED BIBLE

A Great Curiosity

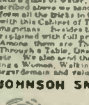
The Smallest Bible in the World

The Midget Bible is a perfect gem in the words of art. It is printed in large, clear postage stamp and contains the OLD AND NEW TESTAMENTS, HUNDRED AND FIFTY PAGES of the NEW TESTAMENT are illustrated. This little Bible is a wonder. It is said to be very good testament. Must be seen to be appreciated. Price, only 12 cents, three Bibles for 30 cents, one dozen Bibles for $1.00, or 100 for $8.00. Good money can be made selling these Midget Bibles amongst friends, church acquaintances, Sunday Schools, bazaars, etc. Sold by Vendors, Coin Trick is sure to be dropped

The CONJURER'S CASKET

Apparatus and Directions for a Number of Mysterious Tricks Enough for an Entire Evening's Entertainment

ANYONE CAN DO THEM



50c

It is great fun mystifying your friends. Get this Conjurer's Cabinet, and you will be a shrewd fellow in your district. It contains the apparatus for seven first-rate tricks, including The Disappearing Ball, which is performed on the lapel of your coat, vanishes from sight at will, the Magic Vase and Ball Trick to Wonder Ball is found in somewhere else's pocket. The Magic Wand with which you can produce anything out from almost to the, the Wonderful Handkerchief is required to be placed in an envelope, and when opened an entirely different handkerchief is found; The Unexpected Visitor, a card is placed in the wonderful box, and when opened again, is found to have vanished entirely, or a card selected by a person is found in a sealed envelope which he has placed in his pocket. Each trick defies the keen eye of examination by anyone from the palm of the hand, nose, cheek, wall, clothing, etc.; The Genuine Vanishing Coin Trick is to coin is dropped into a glass of water, and when the water is poured out the coin has vanished. With the seven tricks described above we send full printed instructions for performing them, and the great amusement of their friends or the public. Any boy or ordinary intelligence can perform these tricks after possessing one or two performances. Do not interfere to remove a single article contained in the Cabinet, there are twenty-five other tests and illusions fully explained with full printed instructions, for which post no extra charge. Remember, the Winner is a Pack of Cards, The first Trick, To Knott a Tumbler Through a Table; One Thousand Dollars, To Find the Number Three Thousand, Mysterious Wedding Ring, all these and the secret of performing three wonderful stage tricks, as follows: The Art of Forming a Woman's Head in the Palm of a Hand, and The Disappearing Lady; complete with full printed instructions for each trick, and reliable hints to amateur conjurers. PRICE COMPLETE ONLY 50 CENTS.

JOHNSON SMITH & CO., Dept. E 3, 54 W. Lake St., CHICAGO

The Newest Novelty Aerial Balloon

Flies gracefully in or outdoors. This is the VERY LATEST SENSATION IN BALLOONS. A brightly colored balloon that one leaves the hand and flies gracefully in the air. When released, the air pressure sends the balloon SOARING UPWARD, the big-back propeller REVOLVING AROUND AT A LIVELY RATE. The effect is startling. It is a graceful flier that makes the spectators WILD WITH JOY. May be used repeatedly indoors or outdoors. An immensely interesting toy. Price 10c each, 3 for 25c postpaid.

JOHNSON SMITH & CO., Dept. E 3, 54 West Lake Street, CHICAGO

"The Baby" Double Action Hammerless Revolver

A HANDSOME AND MOST EFFECTIVE WEAPON

$5.50 Measures but 4½ inches long

Takes regular .22 calibre cartridges

The new Baby Double Action Hammerless Revolver has been produced to meet the ever increasing demand for a revolver that would combine small size and small in size, yet is just as effective and serviceable as the most expensive weapon sold there is no safer or better one made than this. A great feature is its safety action that guards against accidental discharge, even when it is quite safe to pull the trigger. The illustration gives an idea of its appearance, but it must be seen to be appreciated. The ammunition used is the .22 short (short) cartridge obtainable anywhere, or you may obtain the cartridges from us (cartridges can be shipped only by express). The revolver is only $8.50, sent by mail postpaid to any address. JOHNSON SMITH & CO.

THE EXPO WATCH CAMERA

The most wonderful and ingenious Camera made

It is but little larger than a watch, which it closely resembles. You can carry the Expo about in your pocket and take pictures without any one being the wiser.

One Cent a Picture

The Expo loads in daylight with 24 Exposure Films, costing 50c, thus the picture taking cost of a single picture may be had for the nominal sum of One-One cent a picture. 12 Exposure Films are obtainable. The simplicity itself to operate. Take pictures through the lens, where the Real Fine Lens is located. The lens is 0/8.8, 7/81 may be enlarged to any size.

Price $2.50

QUICK AS A FLASH

This and instantaneous shutters; designed by amateurs and professionals the world over. Thoroughly practicable—practical and speeding of films just the same as ordinary cameras. Popular among newspaper reporters, detectives, and the general public. Important feature is the new one-way lock, with the Watch Cannot be unscrewed. Produces clear, sharp negatives indoors or outdoors equal to any camera on the market, all other parts operate as usual.

Expo Watch Camera $2.50 FILMS, 12 Exposure 15c, 24 Exposure, 25c
Extra Lens 50c Extra Shutter

JOHNSON SMITH & CO., Dept. E 3, 54 W. Lake St., CHICAGO

Trim Your Own Hair With the Utility Safety Hair Cutter

Cuts the Hair Any Length, Short or Long—Saves Its Cost First Time Used.

Agents Wanted

Price Only 35c Extra Blades 5c each

If you can COMB your hair you can TRIM your own hair with the UTILITY TRIMMER. Invention. The UTILITY TRIMMER will cut hair any length you desire, short or long, finish. The job so nicely as any barber and in one-fourth the time before your own mirror. The ladies can cut the children's hair at home in a jiffy; can be used as an ordinary razor is required. Made of solid nickel silver throughout, with the sides and the temples and neck. Sharpened like any razor; can be carried in the vest pocket or hand; will last a lifetime.

To use it, stand in front of a mirror, if necessary, and use the UTILITY TRIMMER like you would a comb. Place it over the hair, backward, in the direction the hair lies, but never upward. To cut long hair, first comb the hair and then cut close to the end, then start cutting with downward cuts as high as you desire, evenly all around. The trimmer has rounded ends and temples with a square cut, like a barber.

It is impossible to cut or "cut steps" in your hair with this device, as the handle guard guides the cutter blade evenly over the scalp.

To cut very close, push the blade until the cutting edge is even with the guard teeth.

To shave the face or neck it can be used as an ordinary razor by reversing the blade in the holder, the cutting edge being to the back of the holder, exposing the entire blade, except each corner. To sharpen, place blade in the holder, with the cutting edge to the back, moving the blade out until the cutting edge is clear of the back of the holder. Then move in the usual manner; the edge will be as sharp as an ordinary razor.

JOHNSON SMITH & CO., Dept. E 3, 54 W. Lake St., CHICAGO

New Vamping Card

PIANO PLAYING MADE EASY

By Theodor Hagdad
Burgenlands Simple System

Persons having registered their Musical Education need not despair, for with the aid of our new VAMPING CARD placing the card upright over the piano keyboard, you can play in any key to thousands of Songs, Ballads, Waltzes, Two-Step, etc., etc., equal to a Professional Musician. No knowledge of music is required. After using it a few times, you will be capable with the aid of the Vamping Card entirely. Only 15 cts. p. pd. Johnson Smith & Co., Dept. E 3, 54W Lake St., Chicago

THE GREAT JAPANESE UMBRELLA PALM

A Graceful House or Conservatory Plant, Quite Easily Grown. Easily Grown from Seed, Summer or Winter

The Great Japanese Umbrella Palm is a semi-aquatic plant. It is easily grown from seed in a pot filled with soil and water or in very damp soil. Probably the most novel, as well as the most interesting method, is to cultivate the plant in a bowl or jar—incre filled with water, with two or three inches of good garden soil at the bottom. The seeds need commence to germinate, and the plant shoots up stems two or three feet high and rapidly assumes a most pretty palm-like appearance, as shown in the engraving. The tops of the stems are surrounded by a whorl of umbrella-shaped leaves, of a very graceful form. From the center of the umbrellas, smaller umbrellas branch out, and the effect is decidedly novel. The Umbrella Palm is a perfect fish table or window fish the conservatory, and indeed for all decorative purposes, fish bowls, aquarium, etc. We will take a package of the seed, with full instructions for culture, for only 10 cents, or three packages for 40 cents, postpaid.

Johnson Smith & Co., Dept. E-3, 54 W. Lake St. Chicago

FIGHTING ROOSTERS

A full-blooded pair of fighting game cocks of the Vandyke breed. These birds are hatchers have red feathers, yellow legs and fiery eyes. They are very pugnacious when fighting are perfectly natural and life-like, and the sense of humor mentioned is known only to the operator who can cause them to fight at will. Each pair is sent out as often and as long as desired. Independent of their fighting proclivities they make very pretty mantel ornaments. Price for the pair, in neat box, 10 cents, 3 pair for 25 cents, by mail postpaid. Johnson Smith & Co.

LOADED CIGARETTES

Just Like Ordinary Cigarettes, But Have Been Scientifically

A box containing ten apparently genuine Cigarettes. They contain a charge which will explode when about one-third is smoked.

They appear and feel, and afford as good a smoke (while they last) that the victim be taken entirely by surprise. A great laugh producer and practical joke. Price per box, 10 cents, 3 for 25 cents, postpaid. Johnson Smith & Co., Dept. E3, 54 W. Lake St. Chicago

Potmend

Stops a leak in a minute

The finest repairer for iron—s, Aluminum, Enamelware, etc. Good for kettles, pots, pans, boilers, and every kind of ironware, also for tin, copper, aluminum, tea bottles, iron pipes, cracks in stoves, broken china, porcelain, brick-a-brac, bisque, crockery, woodenware, marble, etc. Will not crack, chip, burn, bake or boil out. THE MENDIS THE STRONGEST SPOT IN THE POT when mended. Just mix the powder with water HARDENS LIKE IRON. Fire proof, Water-proof. You can bil a big hole or a small crack. Mended place stronger than new. Replaces chipped enamel. Averages one to 8; FAILURE IS IMPOSSIBLE. Better and easier than solder. Three sizes, 15 cents, 25 cents and 50 cents.

Every Electrical Man Wants These Books and we ship them for your inspection FREE

Flexible Covers — Handy Pocket-Size Volumes

10 Volumes — 3500 Pages — 4700 Pictures

$1 Per Volume

$1 Per Month

Just what you need to know to succeed in ELECTRICITY

EVERY electrician, every engineer, every mechanic should know about these wonderfully helpful instructive books, which give in plain words a complete working knowledge of electrical engineering in all its phases.

You run into some new electrical problem almost every day. The information you need to help you in your every day work is in

HAWKINS ELECTRICAL GUIDES

These books place electricity at your finger ends. They cover every imaginable subject, principle, theory, problem, trouble, and way of doing things electrically. Every subject is indexed so that you can turn right to it. They are a study course and a reference guide in one, written in plain every day language—no wasted words—only what you need to know—chock full of up-to-the-minute electrical knowledge. The guides are a complete course in electrical engineering. They will help you in every detail of the day's electrical work. You can't ask an electrical question that Hawkins Guides can't answer.

What Electrical Men Say

Helped Him Make Good

"It is only right for me to recommend highly the Hawkins Guides, for they have been of the greatest assistance to me in placing me in my present position as Superintendent of Construction Department of one of Ohio's largest Electrical Companies. I would like to see every man have a set of Hawkins Guides."
Geo. Knecht, Columbus, Ohio.

In the Naval Electrical Dept.

"The Hawkins Guides are great help to me in the Naval Electrical Department, which they cover very thoroughly."
C. J. Cornell,
U. S. Receiving Ship, Brooklyn, N. Y.

Superintendent

"I am now superintendent of the Dunnville Hydro-Electric Systems, and Hawkins Guides were a great help to me in holding down a responsible position."
W. E. Swartz, Dunnville, Ontario.

Wireless Operators

"I have worked wireless for ten years—but I wish I had these books years ago, as they have saved me a great deal of trouble." H. Marshall,
Steamer M & H No. 2,
Walkerville, Ont.

Pocket-Size Flexible Covers

The books are small enough to slip into your coat pocket—handsomely bound in flexible black covers.

You can carry each volume with you until you have mastered its contents. 3,500 pages of actual information and 4,700 illustrations. Once you see these books and put them into actual use you will never again want to be without them. Try it at our expense.

SEND NO MONEY

It will cost you nothing to receive these books—to look them over—ask them all the questions you can think of—use them in your work—study them—pick up some information that will increase your earning ability. We will ship you the entire set of 10 volumes entirely FREE.

This is a sign of our confidence in the guides. Pure gold does not object to being tested. Keep them for seven days and if you do not decide that you can't get along without them, return them to us and owe us nothing.

When you decide to keep them you only have to pay $1.00 down and remit the balance of $9.00 on the easy payment of $1.00 a month till paid for.

Use this coupon to get the books, it will pay you many times over.

You Can Now TREAT YOURSELF at Home
With this Wonderful *Health Restoring*

VIOLET RAY

Most Effective Health, Strength and Beauty Agent Known to Science

YOU CAN HAVE BODILY VIGOR, SUCCESS-ATTAINING ENERGY, ATTRACTIVE, HEALTHFUL BEAUTY—All at practically no cost—The great benefits of the ***Violet Ray treatments*** heretofore only procurable at big expense from physicians and beauty specialists are now available in your own home. Look over list of treatments below. Send for particulars.

Treatment for general debility, nervousness, etc.

Quick relief for rheumatism

Inhaling ozone. For Catarrh, throat and lungs. Marvelous local results with general tonic effect

How Violet Ray Benefits

Electricity from your light socket is transformed into health and beauty-giving Violet Ray—powerfully effective, yet gentle, soothing, perfectly safe. Voltage is raised from ordinary lighting current to *several hundred thousand volts*, giving tremendous penetrative force. The irresistible, revitalizing powers of *Renulife Violet Ray* are carried at once to every nerve cell, fibre and part of body. Blood is enriched and purified by a flood of oxygen, giving added vitality and strength. Assimilation and digestion improved—functions restored to normal—extra supply of fresh blood quickly brought to area treated, removing congestion and supplying nourishment. While relieving pains and aches, the manifest results of disorders, it removes the deep-seated cause; combines the benefits of electricity, vibration, exercise, stimulation and oxidation.

Painless Electricity

Science has modified electricity that the weakest may stand its force without fear or pain. Every tissue and fibre is saturated, patient experiencing only a sensation of relief, as if standing in a ray of sunshine. *Violet Ray high frequency* has no comparison with old, crude, electrical batteries and shocking current. Every jar and shock is removed. The effects are marvelously rapid. Relief can be given in one or more treatments. Often cures are accomplished in that time. It is positive and certain in action. If you value your health, and want to keep or restore your good looks and gain vitality, throw away medicine bottles—take this sensible, scientific means. *Violet Rays* work with nature. Every day's delay makes relief more difficult.

Learn Electricity

In the Great Shops of

COYNE

Trade and Engineering Schools
BENNETT WELLINGTON COOKE, Director
Dept. 23, 39-51 E. Illinois St., Chicago, Ill.

PRACTICAL INSTRUCTION

FINISH IN 3½ MONTHS

Thousands of Electrical experts are needed to help rebuild the world. Come to Chicago to the great shops of Coyne and let us train you quickly by our sure, practical way, backed by twenty years of success. Hundreds of our graduates have become experts in less than four months. *You* can do the same. *Now* is your big opportunity. Come—no previous education necessary.

Earn $125.00 to $350.00 A Month

In the Electrical business. Come here where you will be trained in these great $100,000 shops. Experts show you everything and you learn right on the actual apparatus. You work on everything from the simple bell to the mighty motors, generators, electric locomotives, dynamos, switchboards, power plants, everything to make you a master electrician. We have thousands of successful graduates. Just as soon as you have finished we assist you to a good position. We now have more positions than we can fill. Think of it.

COYNE-TRAINED MEN IN DEMAND

BE A COYNE Trained Expert. Our Graduates are given the Preference. They are in demand Everywhere at big Salaries.

Our graduates are in demand because Coyne is known for its splendid practical training. We are continually receiving letters, telegrams and telephone calls from contractors, manufacturing firms, etc., seeking our graduates to fill responsible positions. We often have many more positions than we can fill and the demand is steadily growing.

We Make You an Expert in Less Than 4 Months

No need of taking from 1 to 4 years to become an expert, we have proved this in thousands of cases. The Coyne method of practical training eliminates all books, useless theory and other non-essentials and trains you in just what you need to know to become an expert.

Day or Evening Courses

Don't worry about the money. Anyone with ambition can learn here. Our tuition is low with small easy payments if desired. All tools and equipment is furnished free. Our students live in comfortable homes in the best section in Chicago—on the lake.

EARN YOUR WAY

Many students earn a large part of their living expenses by doing a little work in their spare time. Our employment dept. furnishes these positions without charge.

LEARN DRAFTING

Skilled Draftsmen are always in demand. Our courses are thorough—short—practical, preparing a man fully to hold a position of responsibility. We have more positions than we can fill. We also have thorough practical courses in *Plumbing and Heating and Motion Picture Operating.*

Send Today for Book

Write today, *now*, for the book. It tells what Coyne graduates have done. What you can do. Fill in the coupon, check the trade you are most interested in or send a postal card, do it *now*.

LIBRARY SEP 2 8 1999 UNIVERSITY OF TORONTO

KNOW ELECTRICITY AS EXPERTS KNOW IT

You can now say to yourself "If others are earning $5,000 per year and up in electrical practice, I can also do it, because Croft's Library contains the same information that these men possess."

Croft's Library does contain just the information you need to reach the big position. It contains all the information you need in electrical practice. Nothing is left out. You are told of every detail in plain language and illustration.

Not one of the thousands of men who own the Croft Library has said he could not understand the books. They are as clear as the elementary readers and arithmetic you studied in school. And yet they are thorough, and do not leave off until you are an expert. They are just as valuable to the beginner as to the highest paid specialist, because they are all practice.

No one interested in any branch of electricity, or who expects to take up the work, can afford to be without Croft's Library.

READ THIS—

Electricity, from the simplest principles, to complete and economical operation of a central station—

Motors, generators, armatures, commutators, transformers, circuits, currents, switchboards, distribution systems.

Electrical machinery of every type, installation, operation and repair.

Wiring for light and power. How to do it mechanically perfect, in accordance with the National Electrical Code.

Wiring of finished buildings. Underwriters' and municipal requirements. How to do the complete job, from estimating it, to completion.

Illumination in its every phase. The latest and most improved methods of lighting. Lamps and lighting effects.

A complete course in mathematics as applied to work. A course which refreshes your mind, and gives you mastery of all the short-cuts in figuring.

Electrical practice complete. Electrical practice as experts know it. Electrical practice by experts.

8 Beautiful flexibly-bound volumes, pocket size, 3000 pages, 2100 illustrations

These eight handy, compact volumes are a work of art. Carefully indexed for quick reference and for study. Every one of the subjects are literally at the finger's end. No turning of pages for what you want.

Not one cent in advance. Merely return the coupon above. Small monthly payments if you are satisfied.

Don't wait another day if you want to know electricity as experts know it. Fill in the coupon now. We will ship the eight volumes charges paid for ten days' examination. Return them at our expense if they are not entirely satisfactory. Pay only $2 per month for eight months if you are pleased

EDITORIAL

Underground Wireless

ELSEWHERE in this issue is disclosed in full detail for the first time what U. S. Navy officials term as the greatest American War Invention: "Underground and Sub-sea Wireless."

Last month we hinted editorially on the theoretical aspect of the problem—this month we are face to face with the accomplisht fact. The war has revolutionized not only peoples, nations and the whole world, but many hitherto unshakable scientific institutions as well. For over twenty years the wireless aërial—the elevated aërial wire system—was synonymous with the wireless art. The great radio station, the trans-atlantic liner, could not well be imagined without its ubiquitous stretch of elevated wires. The greatest pride of the radio amateur, the aërial on top of his house, which to him was symbolic of the young art, is doomed. This change has been brought about over night by the magic wand of science and her servant—Mr. James Harris Rogers, American, of Hyattsville, Md.

The aërial wires, down for the duration of the war, will never go up, at least as far as amateurs and private stations are concerned. As for the commercial stations, their towers too are doomed shortly for the scrap-heap. During the war Mr. Rogers developed underground and sub-sea wireless—for receiving at least—to a heretofore undreamt of state of perfection. His receiving station at Hyattsville never mist a word transmitted from French, English, Italian as well as German high power stations. *He received his messages from Europe when a thunderstorm, accompanied by terrific lightning, was going on directly above his head.* Recently, too, *he has done away entirely with static.*

When the big station at Arlington, near Washington, was out of touch with Europe, due to static disturbances, Mr. Rogers went right on receiving over his buried underground wires, just as if static never existed. Indeed the Rogers invention knows no static. Static being an atmospheric condition, a ground antenna naturally will not be affected by it.

But the most spectacular feature of Mr. Rogers' revolutionizing invention probably is his "Sub-sea Wireless." Scientists the world over, Marconi included, declared it an utter impossibility to communicate by wireless with a totally submerged submarine. Mr. Rogers, however, goes right ahead and does it, not only in fresh water *but thru salt water as well.* Indeed he establisht wireless communication with a submarine *whose aërial wires were 25 feet below the surface of the ocean!*

Altho Mr. Rogers, during the war, gave most of his attention toward receiving messages, he has made considerable progress in underground radio transmission as well. His experiments prove conclusively that, while underground radio receiving is here to stay, underground sending too will soon be practical enough, even for high power stations. It is merely a question of good insulation at present, and the end of this year, we are quite confident, will bring the solution of the problem. The Navy Department has just succeeded in transmitting a distance of 50 miles with the underground system.

At first it would seem reasonable that only long wave lengths could be used with the Rogers system. But this is not the case. Underground Radio-telephone messages, seven miles distant, come in just as clear on 300 meters wave length as does the Nauen (Germany) station with 12,600 meters wave length. This indeed is good news for our amateurs.

But in the meanwhile, all of our pet theories on wireless are thrown in a sad chaos. For we do not know as yet how the Rogers system works. We can now expect a war to the knife between our wave-propagation theorists and the new school of ground-impulse savants. Mr. Rogers himself takes the view—and he is seconded by Tesla—that the transoceanic messages which he receives over his underground system *are not Hertzian waves*—pure or even converted—but merely high frequency ground impulses.

The future may tell us which school is right.

H. GERNSBACK.

The ELECTRICAL EXPERIMENTER is publisht on the 15th of each month at 233 Fulton Street, New York. There are 12 numbers per year. Subscription price is $2.00 a year in U. S. and possessions, Canada and foreign countries, $2.50 a year. U. S. coin as well as U. S. stamps accepted (no foreign coins or stamps). Single copies, 20 cents each. A sample copy will be sent gratis on request. Checks and money orders should be drawn to order of EXPERIMENTER PUBLISHING CO., INC. If you change your address notify us promptly, in order that copies are not miscarried or lost. A green wrapper indicates expiration. No copies sent after expiration.

All communications and contributions to this journal should be address to: Editor, ELECTRICAL EXPERIMENTER, 233 Fulton Street, New York. Unaccepted contributions cannot be returned unless full postage has been included. ALL accepted contributions are paid for on publication. A special rate is paid for novel experiments; good photographs accompanying them are highly desirable.

ELECTRICAL EXPERIMENTER, Monthly. Entered as second-class matter at the New York Post Office under Act of Congress of March 3, 1879. Title registered U. S. Patent Office. Copyright, 1919, by E. P. Co., Inc., New York. The Contents of this magazine are copyrighted and must not be reproduced without giving full credit to the publication.

The ELECTRICAL EXPERIMENTER is for sale at all newsstands in the United States and Canada; also at Brentano's, 37 Avenue de l'Opera, Paris.

How One Evening's Study Led to a $30,000 Job

A Simple Method of Mind Training That Any One Can Follow With Results From the First Day

By a Man Who Made Formerly No More Than a Decent Living

I HOPE you won't think I'm conceited or egotistical in trying to tell others how I suddenly changed from a comparative failure to what my friends term a phenomenal success.

In reality I do not take the credit to myself at all. It was all so simple that I believe any man can accomplish practically the same thing if he learns the secret, which he can do in a single evening. In fact I know others who have done much better than I by following the same method.

It all came about in a ratber odd manner. I had been worrying along in about the same way as the average man thinking that I was doing my bit for the family by providing them with three square meals a day, when an old chum of mine, Frank Powers, whom I had always thought was about the same kind of a chap as I, suddenly blossomed out with every evidence of great prosperity.

He moved into a fine new house, bought a good car and began living in the style of a man of ample means. Naturally the first thing I did when I noticed these things—for he had said nothing to me about his sudden good fortune—was to congratulate him and ask him what had brought the evident change in his finances.

"Bill," he said, "it's all come so quickly I can hardly account for it myself. But the thing that has made such difference in my life lately began with an article I read a short time ago about training the mind.

"It compared the average person's mind to a leaky pail, losing its contents as it went along, which if carried any distance would arrive at its destination practically empty.

"And it showed that instead of making the pail leakproof most of us kept filling it up and then losing all we put into it before we ever reached the place where the contents would be of real use.

"The leak in the pail, the writer demonstrated, was forgetfulness. He showed that when memory fails, experience, the thing we all value most highly, is worthless. He proved to me that a man is only as good as his memory, and whatever progress a man accomplishes can be laid directly to his powers of retaining in his mind the right things—the things that are going to be useful to him as he goes along.

"Farther on in the article I read that the power of the mind is only the sum total of what we remember—that is, if we read a book and remember nothing that was in it, we have not added one particle to our experience; if we make a mistake and forget about it, we are apt to make the same mistake again, so our experience did not help us. And so on, in everything we do. Our judgment is absolutely dependent on our experience, and our experience is only as great as our power to remember.

"Well, I was convinced. My mind was a 'leaky pail.' I had never been able to remember a man's name thirty seconds after I'd been introduced to him, and as you know, I was always forgetting things that ought to be done. I had recognized it as a fault, but never thought of it as a definite barrier to business success. I started in at once to make my memory efficient, taking up a memory training course which claimed to improve a man's memory in one evening. What you call my good fortune to-day I attribute solely to my exchanging a 'leaky pail' for a mind that retains the things I want to remember."

David M. Roth

When Mr. Roth first determined to exchange his leaky mind for one that would retain anything he wanted it to, it was because he found his memory to be probably poorer than that of any man he knew. He could not remember a man's name 20 seconds. He forgot so many things that he was convinced he could never succeed until he learned to remember. Today there are over ten thousand people in the United States whom Mr. Roth has met at different times—most of them only once—whom he can instantly name on sight.

Mr. Roth can and has hundreds of times at dinners and lectures asked fifty or sixty men he has never met to tell him their names, businesses and telephone numbers and then after turning his back while they changed seats, has picked each one out by name, told him his telephone number and business connection.

These are only a few of the scores of equally "impossible" things that Mr. Roth can do, and yet a few years ago he couldn't remember a man's name twenty seconds. Why go around with a mind like a leaky pail when, as Mr. Roth says, "What I have done any one can do."

Powers' story set me thinking. What kind of a memory did I have? It was much the same as that of other people I supposed. I had never worried about my memory one way or another, but it had always seemed to me that I remembered important things pretty well. Certainly it never occurred to me that it was possible or even desirable to improve it, as I assumed that a good memory was a sort of natural gift. Like most of us, when I wanted to remember something particularly I wrote it down on a memorandum pad or in a pocket notebook. Even then I would sometimes forget to look at my reminder. I had been embarrassed—as who has not been?—by being obliged to ask some man whom I had previously met what his name was, after vainly groping through my mind for it, so as to be able to introduce him to others. And I had had my name requested apologetically, for the same purpose, so that I knew I was no different than most men in that way.

I began to observe myself more closely in my daily work. The frequency with which I had to refer to records or business papers concerning things that at some previous time had come under my particular notice amazed me. The men around me who were doing about the same work as myself were no different than I in this regard. And this thought gave new significance to the fact that I had been performing practically the same subordinate duties at exactly the same salary for some three years. I couldn't dodge the fact that my mind, as well as most other people's, literally limped along on crutches, because it could not retain names, faces, facts, and figures. Could I expect to progress if even a small proportion of the important things I learned from day to day slipped away from me? The only value of most of my hard-won experience was being canceled—obliterated—by my constantly forgetting things that my experience had taught me.

The whole thing hit me pretty hard. I began to think about the subject from all angles as it affected our business. I realized that probably hundreds of sales had been lost because the salesman forgot some selling point that would have closed the order. Many of our men whom I had heard try to present a new idea or plan had failed to put over their message or to make a good impression because they had been unable to remember just what they wanted to say. Many decisions involving thousands of dollars had been made unwisely because the man responsible didn't remember all the facts bearing on the situation and thus used poor judgment. I know now that there isn't a day but what the average business man forgets to do from one to a dozen things that would have increased his profits. There are no greater words in the English language, descriptive of business inefficiency than the two little words "I forgot."

I had reached my decision. On the recommendation of Powers, I got in touch at once with the Independent Corporation which shortly before had published the David M. Roth Method of Memory Training. And then came the surprise of my life. In the very first lesson of the course I found the key to a good memory. Within thirty minutes after I had opened the book the secret that I had been in need of all my life was mine. Mr. Roth has boiled down the principles perfecting the memory so that the method can almost be grasped at a glance. And the farther you follow the method the more accurate and reliable your memory becomes. Within an hour I found that I could easily memorize a list of 100 words and call them off backward and forward without a mistake. I was thunderstruck with the ease of it all. Instead of study the whole thing seemed like a fascinating game. I discovered that the art of remembering had been reduced by Mr. Roth to the simplest method imaginable—it required almost nothing but to read the lessons! Every one of those seven simple lessons gave me new powers of memory, and I enjoyed the course so much that I look back on it now as a distinct pleasure.

The rest of my story is not an unusual one among American business men who have realized the value of a reliable trained memory. My income today is close to $30,000. It will reach that figure at the beginning of our next fiscal year. And two years ago I scarcely made what I now think of as a decent living.

In my progress I have found my improved memory to be priceless. Every experience, every business decision, every important name and face is easily and definitely recorded in my mind, and each remembered experience was of immense value in my rapid strides from one post to another. Of course, I can never be thankful enough that I mended that "leaky pail" and discovered the enormous possibilities of a really good memory.

SEND NO MONEY

Mr. Roth's fee for personal instruction to classes limited to fifty members is $1,000. But in order to secure nation-wide distribution for the Roth Memory Course in a single season the publishers have put the price at only five dollars, a lower figure than any course of its kind has ever been sold before, and it contains the very same material in permanent form as is given in the personal $1,000 course.

So confident is the Independent Corporation, the publishers of the Roth Memory Course, that once you have an opportunity to see in your own home how easy it is to double, yes triple the powers of your memory, and how easily you can acquire the secret of a good memory in one evening, that they are willing to send the Course on free examination.

Don't send any money. Merely mail the coupon or write a letter and the complete course will be sent, all charges prepaid, at once. If you are not entirely satisfied send it back any time within five days after you receive it and you will owe nothing.

On the other hand, if you are as pleased as are the thousands of other men and women who have used the course, send only $5 in full payment. You take no risk and you have everything to gain so mail the coupon now before this remarkable offer is withdrawn.

Master Electricity By Actual Practice

The only way you can become an expert is by doing the very work under competent instructors, which you will be called upon to do later on. In other words, *learn by doing.* That is the method of the New York Electrical School.

Five minutes of actual practice properly directed is worth more to a man than years and years of book study. Indeed, Actual Practice is the only training of value, and graduates of New York Electrical School have proved themselves to be the only men that are fully qualified to satisfy EVERY demand of the Electrical Profession.

The Oldest and Only Institution of the Kind in America

At this "Learn by Doing" School a man acquires the art of Electrical Drafting; the best business method and experience in Electrical Contracting, together with the skill to install, operate and maintain all systems for producing, transmitting and using electricity. A school for Old and Young. Individual instruction.

Over 5,000 Graduates are Successful Men in the Electrical World

No previous knowledge of electricity, mechanics or mathematics is necessary to take this electrical course. You can begin the course now and by steady application prepare yourself in a short time. You will be taught by practical electrical experts with actual apparatus, under actual conditions.

Let us explain this course to you in person. If you can't call, send now for 64-page book—it's FREE to you

New York Electrical School
29 W. 17th St., New York, N. Y.

Please send FREE and without obligation to me your 64-page book.

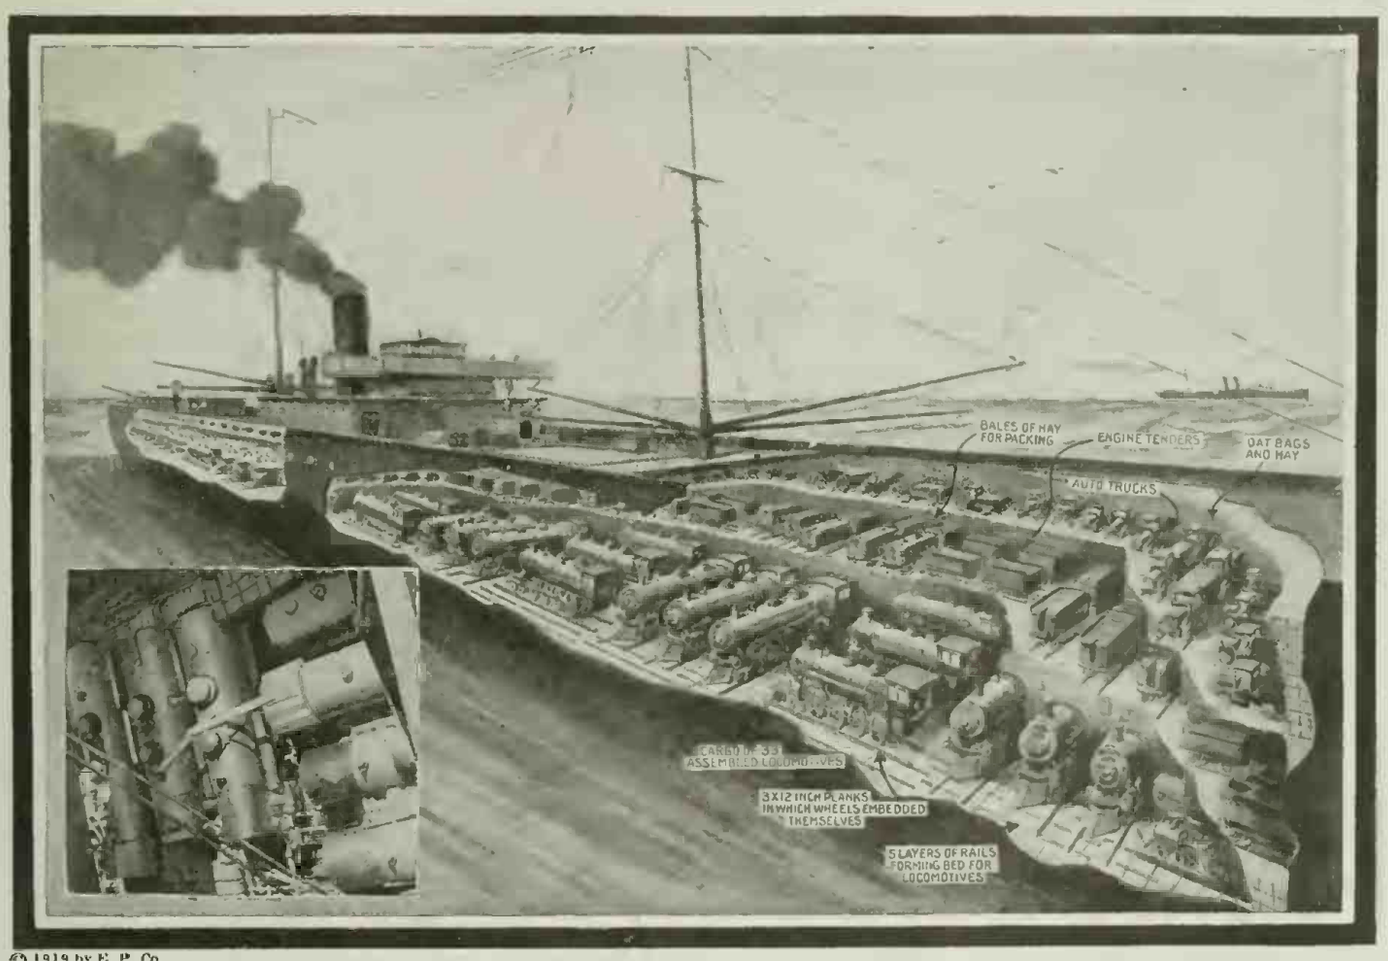
33 Assembled Locomotives on One Ship

The Enterprise of American War Engineering Which Enabled Thirty-Three Assembled Locomotives to be Delivered 'Cross Seas in a Single Ship, for Immediate Duty at the Front.



EVER persevering American ingenuity and the knowledge that "over there" thousands of our boys were depending on us folks back home, to keep our shoulders to the wheel, makes records of the seemingly impossible deeds actually accomplisht, read like the magic of Aladdin's Lamp.

As a specific instance, let us look at the railroad situation in France when General Pershing arrived on the scene of action with the first vanguard of American troops. French Atlantic ports were nearly 270 miles from the fighting front. It was one problem to get supplies across seas infested with mines and submarines, and still a greater task to move this material with all possible haste to the points where it would be most needed. It is well known that the French railroad system had collapst; all it could do was to care for the French army, and to move the thousands of tons of material necessary for the successful campaigning of Pershing's army behind a few creeping French locomotives left at our disposal was well nigh impossible.

General Pershing saw the immediate need for American railroad equipment and one of his first cables home was for the urgent delivery of locomotives, cars and rails. He made the War Department see the need of providing these facilities so that the American effort in the Great Cause would not be a failure. And so it was that Army officials undertook the buying and shipping of locomotives. The first locomotives sent were in great big hulky cases—*knocked down*. As yet they did not dream of sending them *completely assembled*.

Once these parts reached France they were put in the hands of a dozen or more

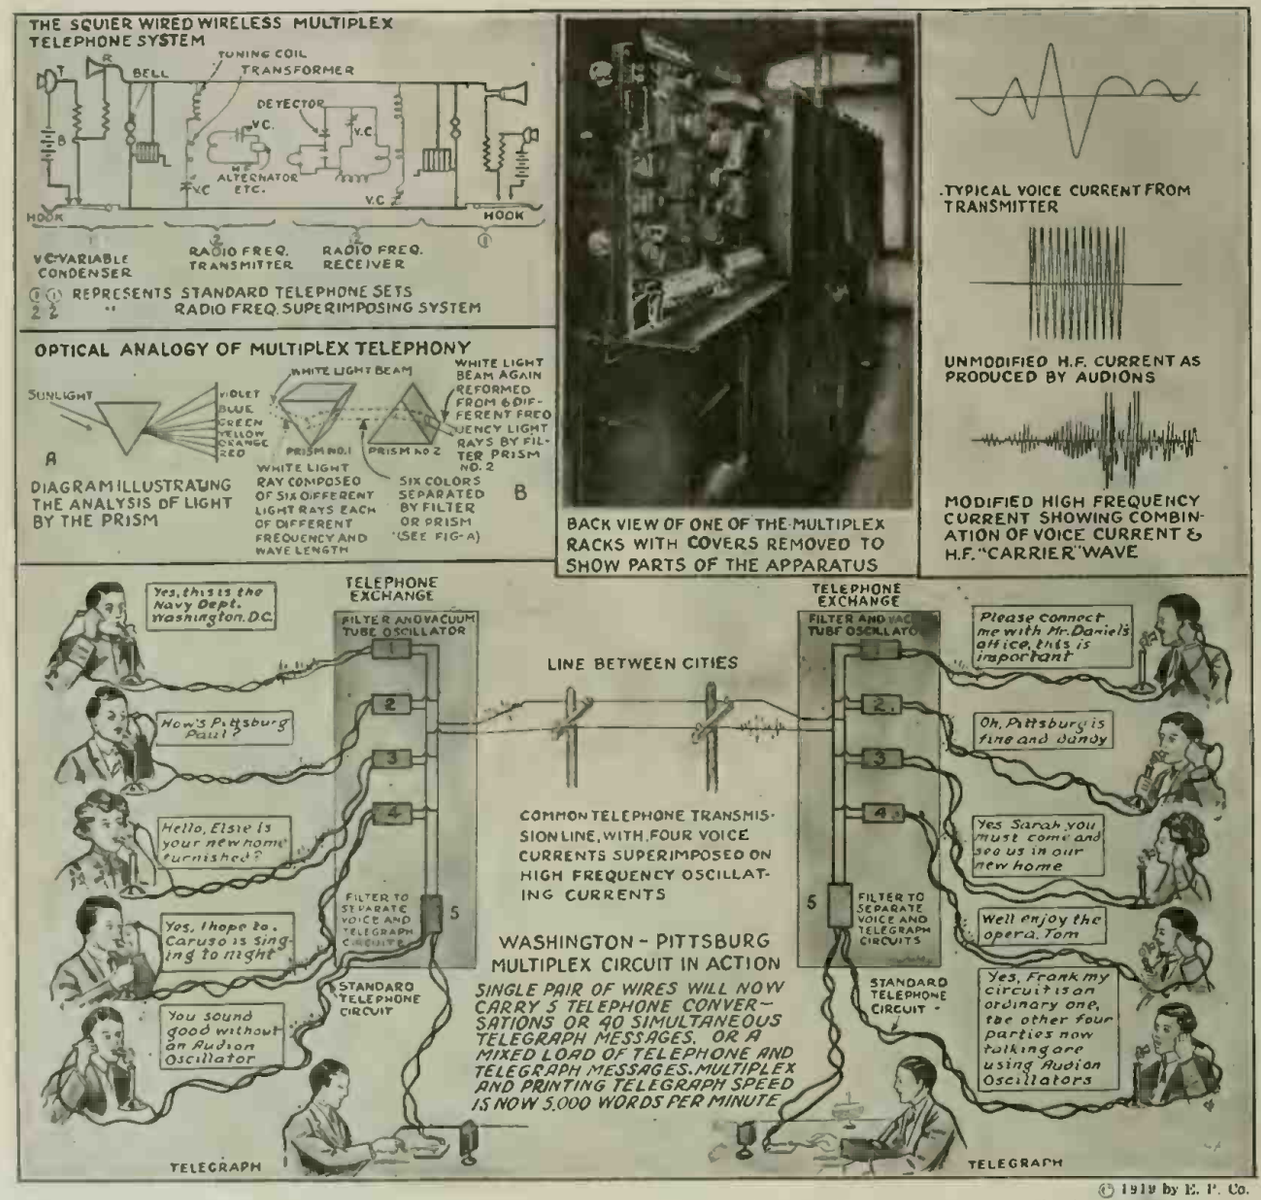
Five Conversations Over One Wire

Multiplex Telephony and How It Works



THE story of the development of the multiplex telephone and telegraph system reads like that of many other inventions. It is a story of long years of effort to accomplish a great result. The steam turbine, for example, is but recently developed to be practically useful and yet was suggested in principle as long ago as 130 B. C. Dr. Alexander Graham Bell was experimenting to produce a multiplex telegraph in 1872 and three years later, while still working on that device, he conceived of the telephone —stated Mr. Bancroft Gherardi, acting chief engineer of the American Telephone and Telegraph Company.

Now, 46 years after Dr. Bell made these experiments, the *multiplex telephone and telegraph system* has become a reality. The system is the product of no one man's efforts, but rather the result of the cumulative efforts of several hundred members of the Bell Telephone System's engineering staff, covering a period of years. It is one of the greatest single contributions to the science of telephony since that science was born in a Boston attic in 1875. Its possibilities lie in the direction of expansion of long distance service. Physically it can be employed on any open wire telephone line, but practically it is not advantageous to use it on any short line, say less than 100 miles in length. The highly technical equipment required is so costly that it is economically available only for long lines. There is at present but one installation in service, that on the Baltimore-Pittsburgh line used in the recent demonstrations. But for the great amount of war work that has engaged our attention, the system would have been demonstrated sooner, and it happened that the need for more circuits to handle the traffic between Washington and the war-work center, Pittsburgh, determined the selection of the place to make the demonstrations. There were sufficient wires from Washington to Baltimore, but not enough from Baltimore to Pittsburg. The multiplex system, therefore, was installed at Baltimore and for several months now it has been carrying messages, which come to Baltimore from Washington over the ordinary circuits and these are given to the multiplex for transmission to their destination.

For some years past the Bell System engineers have sought to make it possible for anyone to talk to anyone else in any other part of the country at any time. The phantom circuit, which utilizes wires in two ordinary circuits to provide a *third* conductor of speech, was a great step toward this goal, greatly expanding the service possibilities of existing long lines. Then came *transcontinental telephony*, making a real neighborhood of the Nation. Now, with the multiplex system, the engineers greatly enlarge the service capacity of all long lines which economically may be equipt with the system. The three transcontinental circuits, for example, two of which are of wire while one is a phantom circuit, when equipt with the multiplex system can carry 10 telephone conversations at once, instead of 3 as at present.

The new system sends five voice currents *simultaneously* over *one* telephone circuit of two wires, taking each current as it is delivered into an ordinary telephone and delivering it at its destination, thru another ordinary telephone, exactly as it was formed at the sending point. These five voice currents travel together and are sorted for delivery at their destination. Not a tone or inflection of the speaking voice is changed in passage. This result is achieved by combining each voice wave with a high-frequency inaudible *carrier current* which has characteristics in degrees of frequency that are entirely different from those of other carrier currents. See the various forms of the voice and carrier currents shown herewith. The carrier current

(*Continued on page* 826)

© 1919 by E. P. Co.

Multiplex Telephony and Telegraphy Is Now an Accomplisht Fact. How It Actually Works Is Here Explained By Analogy and Picture Diagrams. Five Telephone Conversations Can Be Carried On Over One Pair of Telephone Wires, While Telegraph Messages Fly Over the Circuit in Either Direction Simultaneously.

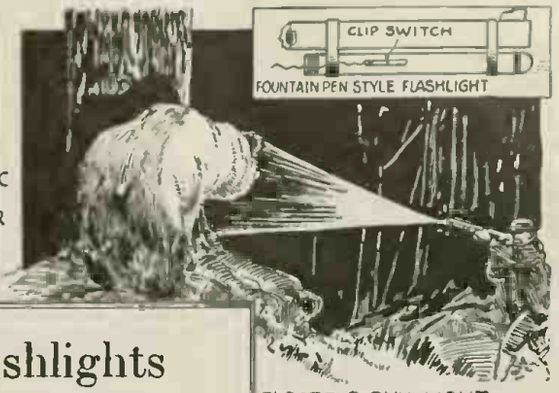
The Latest Style in Flashlights

A POCKET flashlight with its small one-half or one-candle-power tungsten bulb operated by a small dry-battery, has practically become a household article the world over. Flashlights are today manufactured by the million, while more millions of people are daily clamoring for them. Tens of millions of flashlights were in constant use during the progress of war-time activities in Europe, and what a great boon it has been to the soldier can well be imagined. The accompanying illustrations show a number of extremely useful and not always well-known applications of the pocket flashlight which will prove of practical use on many occasions.

One of the latest and ingenious arrangements for utilizing a flashlight is that shown at Fig. 1, which comprises an *illuminated note-pad* for use at night or in dark places. The use of this illuminated note-pad will prove very extensive undoubtedly, and for one thing it may often prove of assistance in taking notes at lectures, not to mention a very wide application in the Army and Navy. The illumination is so arranged that no noticeable glow is seen, but simply the illuminated square opening over which the paper roll slides. A second paper roll is included, so that a carbon copy can be kept for record. The case when closed resembles a kodak.

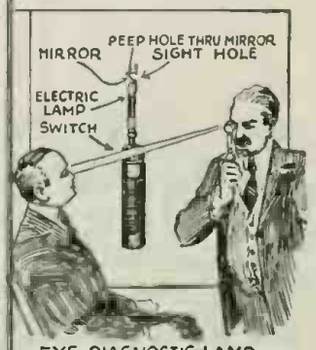
Figure two shows a self-contained *electric light mirror*, invented by Mr. H. Gernsback several years ago. This unique mirror has a small flashlight battery placed in the hollow handle. On the front of the handle a push-button is placed and the wires to the lamp at the top of the mirror frame are secreted within it.

Figure three shows the *gun-light* which has been quite extensively exploited, and while we have never had the opportunity of trying out a fountain-pen flashlight or a larger model flashlight attached to a rifle, we have seen the pistol flashlight used, and it proves one of the most deadly combinations imaginable. All the marksman has to do is to move the pistol about until the target lies in the center of the subtended flashlight zone and then pull the trigger. It should prove a fine thing for hunting down burglars, rats, cats, and what not.



A recently patented eye-diagnostic lamp, known as a *retinoscope* is illustrated in Fig. 4. This comprises a very compact and efficient electric lamp and mirror, as well as sighting device for the use of opticians in examining the eye. The flashlight battery is contained in the handle of this efficient instrument, and the bulb of the flashlight projects a beam of light on to the small mirror, which is set at an angle of 45 degrees. Thru the center of this mirror there is a small hole which is in line with a sighting tube at the rear of the mirror frame. It is used in the manner illustrated.

The well-known flashlight combination, known as the *shave light*, is shown at Fig. 5. Several varieties of this handy device are on the market and it has proved a blessing indeed to thousands of soldiers—officers and dough-boys alike—who have often had to shave in dingy or pitch dark dug-outs and other places of shelter on the battlefield. In the shave-light device illustrated by Fig. 5, the flashlight battery is connected by means of a small flexible twin-conductor with a lamp bulb placed over the mirror.



One of the latest and most practical every-day uses of the flashlight is in meter-reading. See Fig. 6. The usual application of the flashlight in this field involves the carrying of an ordinary tubular flashlight by the meter reader, but the illustration herewith shows one of the newer developments in the form of a *flashlight meter camera*. With this clever device it is only necessary to place the camera before the meter to be read, the button is prest, several flashlight bulbs connected in multiple throw a strong light on the meter dials, the camera-shutter clicks simultaneously, and (*Continued on page* 821)

"The Border Wireless" and "The Hun Within"

STEVE RANSOM (William S. Hart), a typical Westerner, who has been reared on a ranch in Wyoming, which was wrested from his parents by a railroad company, becomes embittered and revengeful, and taking the law into his own hands, develops into a bandit, committing several daring robberies at stations belonging to the railroad company which had despoiled him and brought his aged parents to death. He eventually becomes a fugitive with a price upon his head and drifts to Yellow Dog, Arizona, near the Mexican border.

Elsa Miller is a telegraph operator at Yellow Dog, and the guardian of her younger brother, Carl. Elsa is on her way to deliver a message to Herman Brandt at the Magdelena Mines and is attacked by Mexican bandits. Steve rescues and falls in love with her and decides to remain at Yellow Dog. Frederick Brandt loves Elsa, but she is unaware that the Magdelena Mines have been converted into the headquarters for German spies with a cleverly concealed wireless apparatus by which messages are transmitted to Mexico and from there to Honduras and then to Berlin. Brandt is in direct communication with Von Helm, head of the German Secret Service in New York City.

Steve becomes suspicious of Brandt, when he and his assistant, Frederick Schloss, express contempt for the American flag and the fighting abilities of the United States. Steve forces Brandt to kiss the American flag. War with Germany is declared, and Steve determines to enlist. He calls on Elsa, determined to reveal his past life to her, and invites her to ride part of the way with him to Fort Scott; she plainly evinces her love for Steve. During their absence Steve's shack is ransacked by Brandt and Schloss; photographs of Steve's father with an inscription on the back, reveals the fact that Steve's real name is Ransom, and not Allen—which name he assumed while in Yellow Dog. Brandt sends a telegram to the Sheriff at Willow Springs, asking for information regarding Steve and thus learns that Steve is a fugitive from justice. Carl reveals the fact that Steve is on his way to Fort Scott to enlist, and Brandt forces the boy to telegraph the commanding officer at Fort Scott the facts he has discovered regarding Steve.

While awaiting examination at Fort Scott, Steve overhears the conversation between the commanding officer and the telegraph operator, and makes his escape through a window. He is pursued by the soldiers but eludes them and takes refuge in a wooded canyon. Elsa learns of the occurrence, but this does not shake her faith in him. A day or two later, a code message comes for Brandt, and Carl starts with it for the Magdelena Mines. He is thrown from his horse and is lying unconscious, when Brandt and Schloss and another spy ride by. They go thru his clothes and find the message, which is translated with the aid of a code book. Carl, who has regained consciousness, overhears the translation of the message, the purport of which is that General Pershing is on his way to Europe and the Germans are planning to sink the vessel on which he has sailed. The two men take their departure, leaving their man to watch Carl.

Elsa now appears and Carl whispers to her the nature of the message. The German, hiding behind the bushes, overhears Carl and is about to shoot him, when Steve, who has been hiding in the bushes all the time and witnest the entire proceeding, kills the German. Carl is moved to a comfortable position, and Steve and Elsa ride to the Mine to prevent the sending of the message, which would mean the death of General Pershing, surprise the Germans, and after a fierce battle, take possession of the *wireless apparatus* and succeed in sending out a call for help to Fort Scott, after which they destroy the wireless. The soldiers arrive and make the Germans their prisoners. The charge against Steve is dismist and the story ends happily with Steve and Elsa watching the soldiers lined up for the sundown dress parade.

Gold and Silver Located With Sound Waves

MOST probably you will remember having read some of those entrancing fairly tales in your younger days, wherein a person happened to be gifted with such transcendental intellectual powers, that he could for example stamp his foot on the ground or simply make a certain sound when the location of gold or silver would immediately be made known to him. Of course this all sounds like "Bul-garia" to us nowadays, but thanks to a twentieth century magician, Prof. R. A. Fessenden, the brilliant American inventor and scientist, it has become possible to do this identical thing, i.e., to project a sound wave, and by measuring its reflection and deflection scientifically by means of suitable detecting and recording instruments, to locate exactly the position of underground ore bodies, no matter what the ore may be, whether gold, silver, lead, zinc, copper, etc.

Copyright, 1919, by E. P. Co.

Now We'll All Be Rich, Thanks to Prof. Reginald A. Fessenden, the Eminent American Scientist, Who Here Tells Us How to Positively and Accurately Locate Metallic Ore Deposits in the Earth. The Principle Involves the Measuring of the Sound Velocity Between Various Points and the Determination of the Direction from Which It Is Refracted in Each Case.

As Prof. Fessenden points out in his patent on this scheme of locating ore bodies, his invention provides methods and apparatus whereby, being given or having ascertained two or more of the following quantities, i. e., the time, distance, intensity and medium, one or more of the remaining quantities may be determined. For example, being given the distance between two points in a mine, and having determined the time required by a sound wave to travel between the two points, it is then possible to draw calculations in regard to the probable nature of the rock between the two points; also, if an echo be observed or a refraction of the sound, it is possible to estimate the distance of the reflecting or refracting vein. Hence this new apparatus is intended for the location of hidden ore bodies by means of measurements made on the velocity, direction, reflection, refraction, absorption and other phenomena of sound waves transmitted thru the medium containing the ore bodies, which is invariably, of course, the earth. The inventor claims that by this means he has been able in a certain test to determine the location accurately of a body of mineral, invisible to the eye, at a distance of two and one-half miles, and further, this test was witnest and verified by a number of skilled engineers.

In starting to survey a piece of ground by this method, in which ore deposits are suspected, a space may be laid off about five miles square, as the accompanying illustration shows. This gives an area of twenty-five square miles under survey. At each corner of this square there are driven four drill holes, A, B, C, D, which are filled with water. Toward the bottom of these water filled holes there are placed sensitive sound detectors, such as microphones or small Fessenden oscillators, D_1, D_2, D_3 and D_4. These sound receiving devices are connected to the secondaries of transformers as indicated, and to oscillographs of the photographic recording type. These oscillographs employ the quartz-fiber Einthoven galvanometers. In one of the wells there is placed a powerful sound producing apparatus, O, preferably of the Fessenden oscillator type also. This is connected thru its leads, with the primaries of the transformers in the oscillograph circuits and to the alternating current dynamo, A—D, whenever the key K is deprest. Hidden ore bodies are indicated at the points H and I.

The oscillograph recording apparatus is so adjusted that when the sound-producing oscillator key, K, is deprest, a moderately strong indication is produced on the photographic records of the oscillographs, R—O, which fixes on the photographic records the exact instant at which the key is deprest. Simultaneously a sound wave is emitted from the oscillator, O, which after being reflected as at G by the ore body H, or reflected back as from J, Fig. 2, by the body I, or reflected as from P by the ore body I, or refracted as at LL, or possibly proceeding directly thru the earth as shown by the dotted lines M—N, reaches the indicators or microphones, D_3, D_4, D_2 and D_1 and is recorded on the oscillographs R—O's, 3, 4, 2 and 1.

Instead of using the alternator to produce the sound at the oscillator, O, a condenser discharge may be employed to actuate a sounder, the condenser key on being deprest charging the condenser from a battery, and on the key being released and coming against a second contact, it discharges the condenser thru the sound producing mechanism. The patent describes this auxiliary sound producing mechanism.

Since the oscillograph photographic strip moves along thru the machine with a regular and known velocity, the distance on the strips between the records produced thru the transformers whenever the key, K, is deprest, and the records made by the sound waves received, whether direct or by reflection, refraction or echo, will indicate the distance between the drill and holes and

Sorting Tobacco Leaves by Electricity

By GEORGE HOLMES

MANY ingenious machines and devices have been invented and are widely used in the manufacture of tobacco products and all modernly equipt cigar and cigarette factories bristle with machinery. The more striking is the fact that the tobacco growers and planters have been much neglected by the genius of inventors. Thus we see that tobacco is grown today with the same primitive methods as it was 100 years ago.

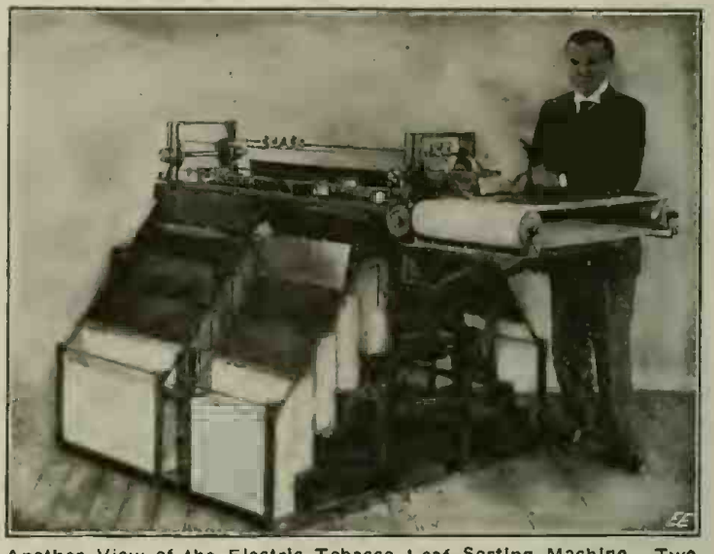
The inventive spirit of our progressive age, which benevolently gave a helpful lift to almost every trade and industry and handed so many labor-saving appliances to agriculture, past in silence the extensive tobacco plantations of America and the world.

Upon the initiative of one of the biggest tobacco growers in the world, a New York inventor and engineer, Mr. H. Hartman, took up the problem several years ago of tobacco planting and handling right at the farms. And what he saw there set him to thinking. He soon noticed that one of the most costly operations at a tobacco plantation is the *sorting of leaves by their different length*. Every leaf is taken by hand at both ends and measured and placed according to its length into a different box.

So-called sun-grown tobacco is usually sorted or "sized" by two inches, while shade-grown tobacco, which is used for wrappers, is "sized" partly by inches and partly by two inches. This work is done after the leaves have past thru the "curing" process and are brown, soft and pliable.

Now anyone can easily imagine the tremendous amount of manual labor involved in measuring each single leaf of the many millions grown on an average tobacco farm. But the tobacco can not be sold if not sorted into different lengths.

After many experiments with three gradually more and more improved machines, which Mr. Hartman constructed at his workshop and laboratory, he finally succeeded, and the semi-electric "Leaf Tobacco Sizing and Sorting Machine", illustrated here is the result. This machine also marks as a milestone the opening of tobacco growing to mechanical development.



In this machine, which is also shown diagramatically, the tobacco leaves are simply placed upon a feeding belt by an operator in front of the machine. This belt brings the leaves below two curved clamp openers which always open two pairs of clamps, carried by two endless roller chains moving under 90° horizontally to the feeding belt over a distribution table or bench. The clamps, after having been opened during motion by said curved openers, grip the leaves at their stem and pull them over the table and thru a pair of resilient contact rollers, which stand vertically in the path of the motion of the clamps. As long as a leaf is between the contact rollers, a metallic electric contact between the latter is prevented, but a low voltage circuit will be closed thru them the moment the tip of the leaf passes out. As the contact rollers are co-operating with a series of contact segments arranged at the centre line along the bench, one of these segments will be swept by a contact brush from the clamp in circuit with the rollers. An electric current will then pass thru the rollers, said particular segment and one of a number of solenoids will attract its armature and thus open one of the covers, which can be seen arranged under an incline at both sides of the machine.

At the same time an electro-magnetic stop will emerge from the flat table and, being in the centre line with the clamps, will force the latter to open, and to drop the leaf upon the table, from where it will be blown the next moment by comprest air over the edge of the table and slide by gravity downward to fall into the box arranged below the open cover. According to the length of a leaf, a certain contact segment on the table will be in circuit with the contact rollers only at the moment said leaf passes entirely thru the rollers, and only that particular cover connected with said segment will open, as intermediary relays will at the same moment interrupt for a predetermined time the connection between all following segments and their respective solenoids. There are as many segments and solenoids as there are different covers. The first section, having five boxes, will receive the five shortest leaves. If a leaf is longer, no segment will come into contact in said first section, the electro-magnetic stop will not appear and the clamp will carry that leaf into the second section where the same process will be repeated. The second section provided with five boxes of longer dimensions, is an exact

Hospital Ship Fitted with Gyroscopic Stabilizer

PERHAPS you are familiar with the mechanical device known as a "gyroscope", which possesses remarkable self-centering or stabilizing properties. The Sperry airplane stabilizer, as well as the non-rolling ship stabilizer, utilizes this clever device. It involves the simple phenomenon that if you take a heavy steel or other wheel and spin it at high speed, then the spinning wheel and its attached frame will tend to preserve the same plane of rotation. This is daily demonstrated by the ordinary bicycle. Hold the bicycle clear of the ground and have someone turn the pedals rapidly. Now try to turn the bicycle sidewise while the wheels are rotating at high speed. You will find it very difficult—all because of the law above stated. Thus the naval engineers have discovered that by placing one or more powerful gyros in a ship, that the ship will not roll to any appreciable extent in a heavy sea. Hospital and war-ships are therefore being fitted with giant electric driven gyros for the purpose of keeping them on a more even keel in stormy weather. The improvement in gunnery from warships so equipt and stabilized is readily apparent.

The Principle of the Gyroscope—the Peculiar Property Possest by a Rapidly Revolving Body of Trying to Preserve Its Original Plane of Rotation, Has Been Taken Advantage of by Naval and Marine Engineers. Here We See the Largest Naval Hospital Ship Ever Constructed Being Fitted with Stabilizing Gyros to Minimize Rolling at Sea as Much as Possible. The Final Tests Showed That the Gyros Reduced the Rolling Some 90 Degrees.

The Two Upper Photos of the Gyros Being Installed in the Gigantic Naval Hospital Ship Are Interesting. That at the Left Show the Powerful Traveling Crane Used to Swing the Two 50 Ton Gyros In thru the Side of the Ship. The Right-hand Photo Shows a Close-Up of the Two Massive Electric Driven Gyros, Just Before They Were Swung Into the Ship's Hull. A 75 Horse-power Motor Drives Each Gyro Wheel in a Vacuum Tight Casing

One of the accompanying photos shows Gyro unit No. 2 of the twin set just being transferred by a hundred-ton S-leg crane. A second photo shows a close-up of the two Gyro units, while the third photo shows the relative size of the Gyros with the ship and also the massive traveling crane used to swing them into the ship.

These Gyros were installed in a Naval Hospital ship so that the wounded on board would be subject to the least amount of rolling, that to the present time is very apparent on all ships, especially in bad weather. The final stabilizing test with the Gyros was found to reduce the rolling some 90 degrees, so it can be readily seen that they do help some.

The combined weight of the unit was 100 tons and the ship was the largest hospital ship ever constructed. The weight of the two gyro wheels is 25 tons each. The weight of the two casings is 25 tons each. The diameter of the gyro wheels is 9 feet, and of the casings 12 feet. The bearings used are standard roller type and self-aligning, fitted to 12-inch shafts. The power used to drive the gyro wheel is a 75 H.P. A. C. electric motor in each. The casing was made absolutely vacuum tight and the gyros run in 30 inches or nearly perfect vacuum. The bearings receive a continuous bath of oil, pumped at the rate of 200 gallons a minute, properly screened and cooled. In 35 minutes the gyro attained a speed of 1,100 R.P.M (working speed). A trial speed of 1,600 R.P.M. was attained, the current cut off and the gyros ran for *three and one-half days*, gradually dropping in speed to "Dead".

The side of the ship had to be cut away in order to install the gyros and they were slid into place by means of skids; the time required to slide them into place was 7½ minutes. Besides the 75 H.P. A. C. motor in each gyro, a rotary-converter is used and another 75 H.P. motor is used to *precess* the gyros from left to right to meet the roll of the ship. This last motor is controlled by another sensitive gyro (small and of high speed) located on the ship's bridge.

The two gyros were located amidships below medi-centric height and they ran in opposite directions to each other; that is, the port gyro ran clock-wise and the starboard gyro ran anti-clock-wise, both at the same speed. To reduce the vibration of the gyros to a minimum they were balanced by the plug-method and it took several experts two months to balance them, so perfect must the rotational balance be. Two years were required to complete the gyros and others of larger size are being constructed for super-dreadnought work. These will enable more accurate aim to be had in firing from the ship. Gyros of smaller size are also installed on submarines and destroyers, both classes of installations giving remarkable results.

THE PHOTOELECTRIC SENSITIVITY OF BISMUTHINITE AND VARIOUS OTHER SUBSTANCES.

A recent contribution to the Bureau of Standards scientific papers by Dr. W. W. Coblentz summarizes the results of an investigation of various substances (1) for an increase in electrical conductivity caused by the action of light upon them, and (2) for photoelectric activity when they were charged to a negative potential, in an evacuated chamber, and exposed to light. Pure gallium and silver sulfid were found to have but small photoelectric activity when charged to a negative potential and exposed to light. No change was observed in the electrical conductivity of tellurium, boleite, pyrite, silicon, and mixtures of the sulfids of lead and antimony, when exposed to light. An increase in conductivity was observed in crystals of bismuthinite, cylindrite, molybdenite, selenium, stibnite, boulangerite, jamesonite, and silver sulfid when exposed to light.

Experiments are described in which some of these substances were joined thru a battery to the grid circuit of an audion amplifier and a telephone. The light stimulus was interrupted by means of a rotating sectored disk, as used in Bell's selenium photophone. When using a cell or crystal of selenium the fluctuations in light intensity produced a sufficient change in conductivity to cause a musical note in the telephone. Similarly, in some samples of bismuthinite and of molybdenite, a change in conductivity was produced, which caused an audible sound in the telephone receiver. Further experiments are in progress to determine to what extent and for what wavelengths this is a true photoelectric change (increase) in conductivity, and to what extent it is caused by fluctuations in temperature with a resultant change in resistance within the crystal.

Searchlights of the Deep

Wonderful Fish of the Ocean Depths, That Carry Their Own Lights.

By Dr. E. BADE

IN former years, when the depths of the ocean were still unexplored, it was the common belief that its surface was an uneven monotonous plain, unenlivened by precipices and mountains, hills and valleys. But these ideas have been thoroly repudiated by numerous expeditions sent out to investigate and explore, as far as possible, the conditions existing at the vast bottom of the sea.

The higher parts of the ocean bed, the gentle slopes, the precipices, and the plateaus, which connect the extensive levels of the ocean, are of such an immensity that they can not be compared to anything found on the land. Deep basins of continental extent are interrupted by gigantic marine mountains, while table lands rise from the greatest depth with almost sheer and perpendicular walls.

Only those animals which live near the surface of the ocean and which have ventured within reach of the nets of fishermen, were known in the last century. These nets seldom if ever penetrate more than five hundred feet. But when speaking of the deep sea, a 1,000 foot depth or more is to be considered.

Altho depths of 12,000 feet are common thruout the ocean, a depth of more than 30,000 feet has been reached between two small islands of the Malay Archipelago.

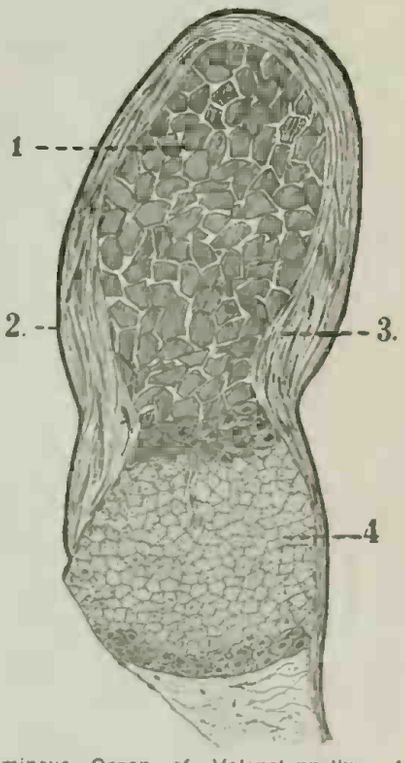
Three hundred feet below the level of the ocean the light is so diffused that it is gloomy, and at a depth of six hundred feet our eye can not detect an infinitesimal ray.

Photographic plates sunk in the Sargasso seas show, at a depth of three hundred feet, all of the different colors of the rainbow; at a depth of 1,500 feet many of the rays can still be found; at a depth of 3,000 feet some of the rays, altho to a much smaller degree, are still present; and at a depth of 6,000 feet no rays can be detected.

A Wonderful Deep Sea Fish Carrying Its Own Electric Light Plant. This Is a Cute Little One by the Name of "Polyipnus Nuttingi Gilbert."

Light does not play such an important rôle in the existence of animal life as it does in the existence of plant life. Plants cannot exist without light. But animal life can and does exist where semi and total darkness prevail. Marine animals living at a depth of 3,000 feet are usually colored black. But those which find their existence just above this dividing line are dark gray to red in color.

But far more wonderful than the absence of light is the fact that animals can withstand the enormous pressure which exists at these depths. It is a simple matter to estimate the pressure exerted by the water at various depths. The weight of a cubic foot of water is equal to the pressure exerted by it. This pressure becomes greater the deeper we go down, and down in the profoundest depths it exerts a pressure of thousands of pounds to the square inch. A result of the pressure is that the tissues of the fish are loosely knit together, and when this enormous pressure is released by bringing these denizens of the deep to the surface, the internal pressure of the body becomes so great that *the fish literally explode.*



Therefore it is no wonder that when the deep sea fish are violently torn from their natural habitat they are invariably in a mutilated condition.

But in these depths of the ocean, where gloom and semi-darkness prevail, the conditions of life are far different from those of the surface waters. The brightly colored algae and sea weeds, the food of many fish, are the children of the sun, while the sinister inhabitants of the profound depths are scavengers, which kill and devour each other.

The faint almost infinitesimal light which penetrates this utter darkness is insufficient to light up the paths of the fish. They do not see their way; they only *feel* their way by means of lateral organs when they come in the vicinity of some boulder or rock. In this darkness we find the most unique and fantastic forms of life—the deep sea fish—which live in perpetual darkness. There, searchlights play thru the watery night, faintly illuminating the vast depths with a cold, death-like glow, a thing man has, as yet, not created.

This wonderful light is produced automatically by the fish. Tiny glands secrete the lighting fluid, reflectors throw it outward, and one or more lenses magnify and control its intensity. (See the illustrations herewith.)

THE UPS AND DOWNS OF A THEATER CHAIR.

WE said it, friends, "the ups and downs of a theater chair", and we might add the "downs and ups"—for can you imagine in your wildest moments of philosophical ecstasy what our theaters are going to look like when Mr. Frank Adsit's electrical elevated opera chair is adopted by our theater managers. No, you guest wrong. This is not a phoney patent, but an honest to goodness U. S. patent. Our artist has endeavored to show several of the incidents which might and likely will occur if this invention comes into vogue, and who will gainsay that it will not—for have not forty-eight states—tried and true—gone clean dry without a whimper? This wonderful motor-operated theater chair is also a real boon to the prohibitionist inspector, for all he has to do is push the button and the occupants of the chairs will rise "high and dry" without a word. Coming down to the real philosophy involved in the design and operation of this newest theater chair, we find that the inventor has provided for causing it to rise and fall whenever a person wishes to pass in front of one of the chairs in order to get to his seat, to one side or the other, by means of three distrinct electromechanical agencies, to wit: 1—by means of an electric motor and screw-gear; 2—by means of mechanically driven worms placed under the floor and screw gear; 3—by means of comprest air.

A small electric motor is connected with a pinion and gear which in turn drive a vertical screw in the base of the seat. This screw registers with an "internal nut" (no, Ella, not the "nut" in the chair) in the piston of the chair as the detail illustration shows, so that when the screw is turned in one direction, the chair will be raised, and when it is turned in the other, the chair will be lowered. The running of the motor is positively controlled by the push button placed on the arm of the chair.

Behold, the Rising and Falling Electric Opera Chair. "It's a Hard Job to Keep the Old Man at Home Now," Is the Complaint of Some Wives, But Can You Imagine What Show Wifey Is Going to Have to Keep "His Nibs" at Home by the Fire-side with His Slippers on, When the 10-, 20- and 30-Cent Vaudeville Show Around the Corner Affords Such an Enticing, Bacchanalian and Irresistible Saturnalia as This? Wow! Wow! Three Booms and a Tiger for Inventor Adsit ('at's it).

You Must Not Fail to Visit the Summer Resorts This Year. They Promise to be More Alive Than Ever Before. For Example—Behold This Wonderful Amphibian of the Sea, Air and Earth. The Inventor Patented and Described Everything But the "Fare." Anyhow, We Are Going to Take Out "Accident Insurance" Before Starting on a Trip.

AN AMPHIBIAN LAND, WATER AND AIR HYDROPLANE.

THE accompanying illustration shows one of the latest inventions in the realm of hydroplanes and this particular species might well be classified as an *amphibian* of the first water. As its inventor states in his patent, —yes, he has really been granted a patent by Uncle Sam on this marvelous contraption—his airship may be used in the air, thru water or upon the land with equal facility. The inventor provides in his design for the combination of a lighter than air or buoyant flying machine with a watertight passenger compartment. Thus he has given us a vehicle which may be used on inundated or marine surfaces, and the vehicle is further provided with wheels, in such a manner as to move readily over any ground surface. The machine is fitted with suitable motors, planes and rudders, all of which are accessible and controllable from the interior of the enclosed cab of the airship. This remarkable hydroplane should prove a great boon to the management of summer resorts, who are forever on the watch for something really new and novel. As our illustration discloses, a great variety of pleasure is afforded the passengers who embark on a voyage of adventure in this hybrid airship.

The superstructure consists essentially of a cylindrical metallic tube having a cigar-shaped front end and an outer wall formed of a number of longitudinal ribs, which are in turn connected to an inner encircling band, thus forming a substantial framework for the ballonets or gas bags, which are used to give the airship the desired buoyancy. The car attached to the superstructure and ballonet frame at the bottom, is provided with windows and doors, all of which may be sealed hermetically from the interior of the car, so that the car may be run thru the water, fully submerged, when desirable or necessary, and in any event the passengers are assured of a most delightful trip among the fishes.

At the rear end of the car is a revolving screw for propelling the hydroplane thru the water, while a rudder is also used to control the direction of the airship in its flight thru the water. On top of the ballonet superstructure, the inventor places two masts for the support of a radio antenna one of which may act as a flag pole. Ar-

Tesla's Egg of Columbus

How Tesla Performed the Feat of Columbus Without Cracking the Egg

PROBABLY one of the most far-reaching and revolutionary discoveries made by Mr. Tesla is the so-called *rotating magnetic field.* This is a new and wonderful manifestation of force —a magnetic cyclone—producing striking phenomena which amazed the world when they were first shown by him. It results from the joint action of two or more alternating currents definitely related to one another and creating magnetic fluxes, which, by their periodic rise and fall according to a mathematical law, cause a continuous shifting of the lines of force. There is a vast difference between an ordinary electro-magnet and that invented by Tesla. In the former the lines are stationary, in the latter they are made to whirl around at a furious rate. The first attracts a piece of iron and holds it fast; the second causes it to spin in any direction and with any speed desired. Long ago, when Tesla was still a student, he conceived the idea of the rotating magnetic field and this remarkable principle is embodied in his famous *induction motor* and system of transmission of power now in universal use.

In this issue of the ELECTRICAL EXPERIMENTER Mr. Tesla gives a remarkable account of his early efforts and trials as an inventor and of his final success. Unlike other technical advances arrived at thru the usual hit and miss methods and hap-hazard experimentation, the rotating field was purely the work of scientific imagination. Tesla developed and perfected, entirely in his mind, this great idea in all its details and applications *without making one single experiment.* Not even the usual first model was used. When the various forms of apparatus he had devised were tried for the first time they worked exactly as he had imagined and he took out some forty fundamental patents covering the whole vast region he had explored. He obtained the first rotations in the summer of 1883 after five years of constant and intense thought on the subject and then undertook

Copyright, 1919, by E. P. Co.

Fig. 2. Illustrating the Polyphase Coil and Rotating Megnetic Field Which Caused Copper Eggs to Spin. Fig. 3. Insert: Detail of Coil Apparatus Showing Coil Connections to Different Phases.

Fig. 1. This hitherto unpublisht photograph is extremely interesting as it shows not only "Tesla's Electric Egg" apparatus in the center of the background, but also a comprehensive view of a corner of his famous Houston Street laboratory of a decade ago. At the left may be seen a number of Tesla's oscillators or high frequency generators, while in the rear may be noted a large high frequency transformer of the spiral type, the diameter of which was a little over nine feet. The electric egg apparatus comprising a two-phase A.C. circular core and winding, rests on a table, and this particular model measured about two feet across. In making the demonstrations, Tesla applied as much as 200 H.P. from a two-phase alternator to the exciting coils, and so intense was the revolving magnetic field created in the surrounding space, that small delicately pivoted iron discs would revolve in any part of the hall, and a great many other devices could be simultaneously operated from this magnetic field when thus excited. The frequency of the two-phase A.C. energizing the coils, was varied from 25 to 300 cycles, the best results being obtained with currents of from 35 to 40 cycles. This laboratory was lighted by Tesla's vacuum tubes, several of which may be seen on the ceiling, and each of which emitted 50 C.P. The coil resting on three legs and observed in the immediate foreground is the primary of a resonant Tesla transformer which collected energy from an oscillatory circuit encircling the laboratory, no matter in what position the transformer was placed. A low tension secondary of one or two turns of heavy cable (not visible) was provided for stepping down the energy collected by "mutual induction," and supplied the current to incandescent lamps, vacuum tubes, motors and other devices. When the circuit around the hall was strongly excited, the secondary furnished energy at the rate of about three-quarters of one horse-power.

www.americanradiohistory.com

the equally difficult task of finding believers in his discovery. The alternating current was but imperfectly understood and had no standing with engineers or electricians and for a long time Tesla talked to deaf ears. But, ultimately, his pains were rewarded and early in 1887 a company bearing his name was formed for the commercial introduction of the invention.

Dr. Tesla recently told the editors an amusing incident in this connection. He had approached a Wall Street capitalist—a prominent lawyer—with a view of getting financial support and this gentleman called in a friend of his, a well-known engineer at the head of one of the big corporations in New York, to pass upon the merits of the scheme. This man was a practical expert who knew of the failures in the industrial exploitation of alternating currents and was distinctly prejudiced to a point of not caring even to witness some tests. After several discouraging conferences Mr. Tesla had an inspiration. Everybody has heard of the "Egg of Columbus." The saying goes that at a certain dinner the great explorer asked some scoffers of his project to balance an egg on its end. They tried it in vain. He then took it and cracking the shell slightly by a gentle blow, made it stand upright. This may be a myth but the fact is that he was granted an audience by Isabella, the Queen of Spain, and won her support. There is a suspicion that she was more imprest by his portly bearing than the prospect of his discovery. Whatever it might have been, the Queen pawned her jewels and three ships were equipt for him and so it happened that the Germans got all that was coming to them in this war. But to return to Tesla's reminiscence. He said to these men, "Do you know the story of the Egg of Columbus?" Of course they did. "Well," he continued, "what if I could make an egg stand on the pointed end without cracking the shell?" "If you could do this we would admit that you had gone Columbus one better." "And would you be willing to go out of your way as much as Isabella?" "We have no crown jewels to pawn," said the lawyer, who was a wit, "but there are a few ducats in our buckskins and we might help you to an extent."

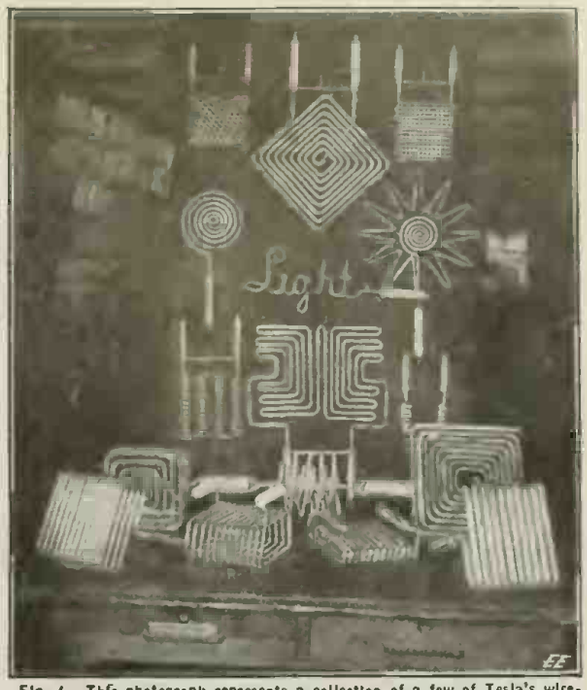

Fig. 4. This photograph represents a collection of a few of Tesla's wireless lamps, such as he proposes to use in lighting isolated dwellings all over the world from central wireless plants. The two lamps at either corner at the bottom are illuminated, owing to the fact that a high frequency oscillator was in operation some distance away when this photograph was being taken. These tubes were filled with various gases for experimental research work in determining which was most efficient.

Mr. Tesla thus succeeded in capturing the attention and personal interest of these very busy men, extremely conservative and reluctant to go into any new enterprise, and the rest was easy. He arranged for a demonstration the following day. A rotating field magnet was fastened under the top board of a wooden table and Mr. Tesla provided a copper-plated egg and several brass balls and pivoted iron discs for convincing his prospective associates. He placed the egg on the table and, to their astonishment, it stood on end, but when they found that it was *rapidly spinning* their stupefaction was complete. The brass balls and pivoted iron discs in turn were set spinning rapidly by the rotating field, to the amazement of the spectators. No sooner had they regained their composure than Tesla was delighted with the question: "Do you want any money?" "Columbus was never in a worse predicament," said the great inventor, who had parted with his last portrait of George Washington in defraying the expenses of the preparation. Before the meeting adjourned he had a substantial check in his pocket, and it was given with the assurance that there was more to be had in the same bank. That started the ball rolling. Tens of millions of horsepower of Tesla's induction motors are now in use all over the world and their production is rising like a flood.

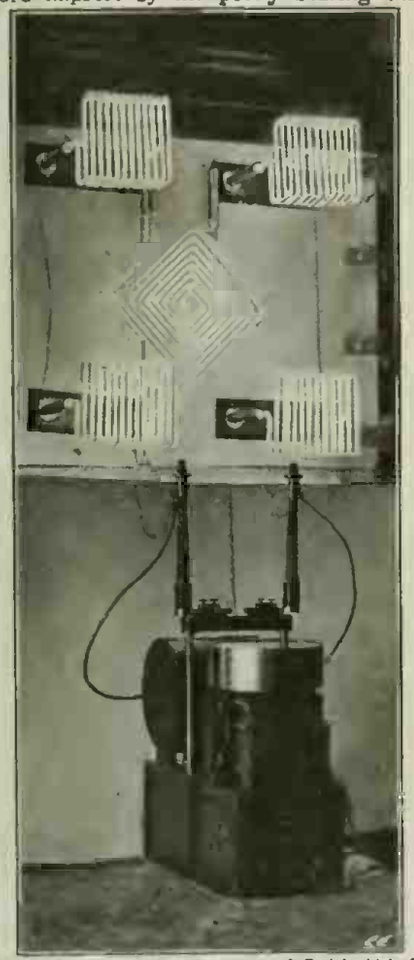

Fig. 5. This illustration shows one of Tesla's high frequency oscillation generators and a bank of his high frequency lamps lighted by the same. These highly evacuated, gas filled tubes were operated in different ways. In some cases they were connected to one wire only; in other instances to two wires, in the manner of ordinary incandescent lamps. Often, however, they were operated without any connection to wires at all, i.e., by "wireless energy", over quite appreciable distances, which could have been greatly extended with more power. The oscillator comprises a Tesla high potential transformer which is excited from a condenser and circuit controller, as described in his patents of 1896. The primary exciting element comprised a powerful electro-magnet actuating an armature, and this circuit was connected with 110 volt, 60 cycle A.C. or D.C. When the oscillator was put into operation, the interrupter actuated by the electro-magnet connected to the 110 volt circuit, became simultaneously the spark gap for the high potential exciting circuit, which included this vibrator, spark gap, a high tension condenser and the primary of the high frequency Tesla transformer. The lamps were connected to the secondary of the latter the terminals of which are seen in the rear of the machine.

In 1893 Mr. Albert Schmid, then Superintendent of the Westinghouse Electric and Mfg. Co. constructed a powerful rotating field ring with an egg made of copper, and larger than that of an ostrich, for Dr. Tesla's personal collection at the Chicago World's Fair. This piece of apparatus was one of the most attractive novelties ever publicly shown and drew enormous crowds every day. Subsequently it was taken to Mr. Tesla's laboratory and served there permanently for demonstrating rotating field phenomena. In his experiments it was practicable to use as much as 200 *horsepower* for a short time, without overheating the wires and the effects of the magnetic forces were wonderfully fascinating to observe. This is the very ring indicated in the accompanying photograph (Fig. 1), giving a view of Mr. Tesla's former laboratory at 46 E. Houston Street, New York. It is shown in detail in Fig. 2, and the mode of winding is illustrated in diagram (Fig. 3). Originally the two-phase arrangement was provided but Mr. Tesla transformed it to the three- and four-phase when desired. On top of the ring was fastened a thin circular board, slightly hollowed, and provided around its circumference with a guard to prevent the objects from flying off.

Even more interesting than the spinning egg was the exhibition of *planetary motion*. In this experiment one large, and several small brass balls were usually employed. When the field was energized all the balls would be set spinning, the large one remaining in the center while the small ones revolved around it, like moons about a planet, gradually receding until they reached the outer guard and raced along the same.

But the demonstration which most imprest the audiences was the simultaneous operation of numerous balls, pivoted discs and other devices placed in all sorts of positions and *at considerable distances from the rotating field*. When the currents were turned on and the whole animated with motion, it presented an unforgettable spectacle. Mr. Tesla had many vacuum bulbs in which small, light metal discs were pivotally arranged on jewels and these would spin anywhere in the hall when the iron ring was energized.

Rotating fields of 15,000 horsepower are now being turned out by the leading manufacturers and it is very likely that in the near future capacities of 50,000 horsepower will be employed in the steel and other industries and ship propulsion by Tesla's electric drive which, according to Secretary of the Navy Daniels' statement, has proved a great success.

But any student interested in these phenomena can repeat all the classical experiments of Tesla by inexpensive apparatus. For this purpose it is only necessary to make two slip ring connections on an ordinary small direct current motor or dynamo and to wind an iron ring with four coils as indicated in diagram Fig. 3. No particular rule need be given for the windings but it may be stated that he will get the best results if he will use an iron ring of comparatively *small section* and wind it *with as many turns of stout wire as practicable*. He can heavily copper plate an egg but he should bear in mind that Tesla's egg is not as innocent as that of Columbus. The worst that can happen with the latter is that it might be,—er—over ripe! but the Tesla egg may explode with disastrous effect because the copper plating is apt to be brought to a high temperature thru the induced currents. The sensible experimenter will, therefore, first suck out the contents of the egg—thus satisfying both his appetite and thirst for knowledge.

Besides the rotating field apparatus Mr.

My Inventions

By Nikola Tesla

2. MY FIRST EFFORTS IN INVENTION

I SHALL dwell briefly on these extraordinary experiences, on account of their possible interest to students of psychology and physiology and also because this period of agony was of the greatest consequence on my mental development and subsequent labors. But it is indispensable to first relate the circumstances and conditions which preceded them and in which might be found their partial explanation.

From childhood I was compelled to concentrate attention upon myself. This caused me much suffering but, to my present view, it was a blessing in disguise for it has taught me to appreciate the inestimable value of introspection in the preservation of life, as well as a means of achievement. The pressure of occupation and the incessant stream of impressions pouring into our consciousness thru all the gateways of knowledge make modern existence hazardous in many ways. Most persons are so absorbed in the contemplation of the outside world that they are wholly oblivious to what is passing on within themselves. The premature death of millions is primarily traceable to this cause. Even among those who exercise care it is a common mistake to avoid imaginary, and ignore the real dangers. And what is true of an individual also applies, more or less, to a people as a whole. Witness, in illustration, the prohibition movement. A drastic, if not unconstitutional, measure is now being put thru in this country to prevent the consumption of alcohol and yet it is a positive fact that coffee, tea, tobacco, chewing gum and other stimulants, which are freely indulged in even at the tender age, are vastly more injurious to the national body, judging from the number of those who succumb. So, for instance, during my student years I gathered from the published necrologues in Vienna, the home of coffee drinkers, that deaths from heart trouble sometimes reached *sixty-seven per cent* of the total. Similar observations might probably be made in cities where the consumption of tea is excessive. These delicious beverages superexcite and gradually exhaust the fine fibers of the brain. They also interefere seriously with arterial circulation and should be enjoyed all the more sparingly as their deleterious effects are slow and imperceptible. Tobacco, on the other hand, is conducive to easy and pleasant thinking and detracts from the intensity and concentration necessary to all original and vigorous effort of the intellect. Chewing gum is helpful for a short while but soon drains the glandular system and inficts irreparable damage, not to speak of the revulsion it creates. Alcohol in small quantities is an excellent tonic, but is toxic in its action when absorbed in larger amounts, quite immaterial as to whether it is taken in as whiskey or produced in the stomach from sugar. But it should not be overlooked that all these are great eliminators assisting Nature, as they do, in upholding her stern but just law of the survival of the fittest. Eager reformers should also be mindful of the eternal perversity of mankind which makes the indifferent *"laissez-faire"* by far preferable to enforced restraint. The truth about this is that we need stimulants to do our best work under present living conditions, and that we must exercise moderation and control our appetites and inclinations in every direction. That is what I have been doing for many years, in this way maintaining myself young in body and mind. Abstinence was not always to my liking but I find ample reward in the agreeable experiences I am now making. Just in the hope of converting some to my precepts and convictions I will recall one or two.

BOYS will be boys, the world over. The Boy Tesla was no exception to the universal rule, as this, his second autobiographical article clearly proves.

Mr. Tesla in his own inimitable, delightful way, here paints with a literary artist's brush his own intimate boyhood in charming as well as vivid colors.

We have often heard of Tesla, the dreamer. But if he is entitled to the epithet, his early boyhood certainly fails to reveal it. Tesla did not allow much grass to grow under his feet while a boy, for he assuredly was a strenuous, red-blooded youngster.

You will wish to read all about the greatest inventor's early boyhood. It is doubly valuable because it comes from his own pen. We promise you an interesting twenty-minutes' entertainment.

—EDITOR.

Oldest and Newest Styles in Trolleys

VERY interesting indeed from a historical point of view are the accompanying photographs, which show respectively the oldest and newest style in trolleys, in the greatest trolley town in the universe, Brooklyn, N. Y., the home of the Brooklyn "Rapid" Transit. The photograph is of an old horse-drawn car of the vintage of 1889. Conductor Buck is seen standing alongside of the car, and it is interesting to note that the motormen in those days did not wear uniforms. Shades of Frank Julian Sprague! If the motormen of today only wore frock coats like this one does. He would be so busy reciprocating the attentions of the female passengers and passing the tea cups that we would never get on the job. Well, as we were saying, this was the latest style car—in 1889, and what is also interesting, Conductor Buck is still with the B. R. T.

Photos courtesy B. R. T. Monthly

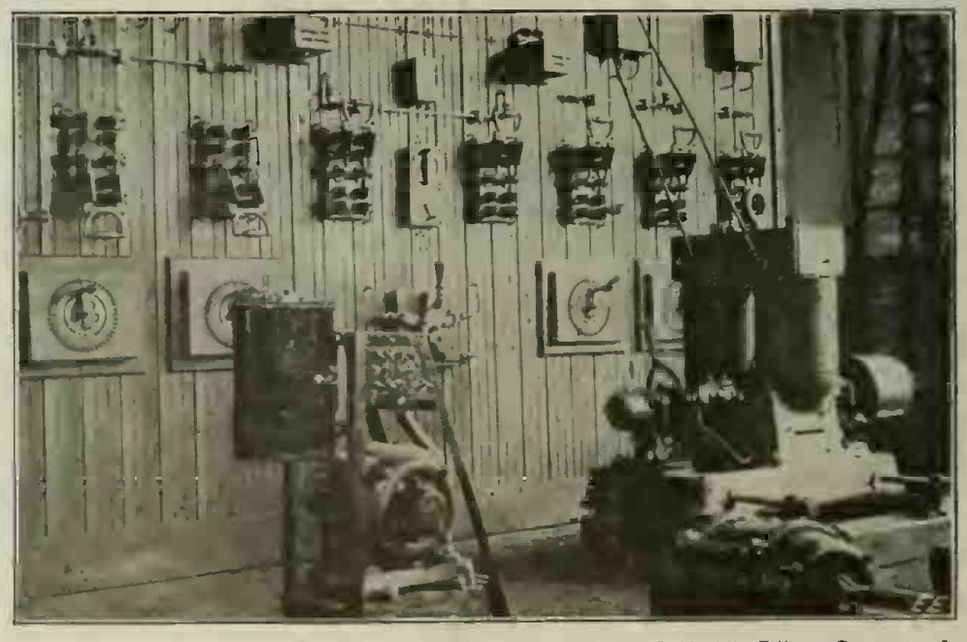
The Newest and the Oldest in "Trolleys." The Large B. R. T. Trolley at the Top Has Two 45 Horse-power Motors to Propel It, Forty-five Times as Much as Its Early Predecessor, Shown Below, Which Boasted of the Prodigious Amount of 2 Whole Horse-power.

The larger photograph shows one of the very latest Brooklyn Rapid Transit Company's electric trolley cars, which instead of being rated at (2) horse-power, as was the 1889 model, develops the prodigious amount of 90 horse-power (each car having two 45 horse-power motors), or *forty-five times as much*. Note the great length of the modern electric trolley car and its greatly increased passenger carrying capacity compared to the old-timer of a generation ago. Now we can speed along home from the theater or from business in an electric trolley at the rate of thirty miles an hour and think nothing of it, but thirty years ago our fathers and grandfathers had to be content to travel homeward after business or the opera in one of these two-by-twice soap-boxes on wheels, pulled by two horse-power, but not always two powerful horses. When heavy snows came, it would sometimes require six to eight horses to pull the car, especially if heavily loaded.

But several of our friends recollect some interesting experiences. For instance when the horse-car got uncontrollable while descending a hill! Here's what happened many a time; the car knocked the horse down and ran up on top of him; then the passengers tumbled out post haste and helped the crew (he was a fine fellow) pull the car off the horse! And you paid as you entered, Oh! yes. If you didn't pile up front and slip your jitney in the fare box, the driver (he was the whole show) bawled you out properly. When you didn't have the change, the motorman past you an envelope containing change for your bill, and you then selected the fare and deposited it in the fare box. This wonderful mechanical masterpiece had an oil lamp inside it, so that the driver could see that you actually deposited the fare.

Electricity was a long time finding its way to trolley roads. The electric motor was developed at that time sufficiently to be adaptable for the propelling of trolley cars, but the complete details for the distribution of the current had not been fully worked out and developed to any appreciable extent. About the only thing electrical around this early traffic carrier was the "bell," and more often than not this was simply a large clapper intended to be yanked with a piece of cord. Horse-drawn trolleys, or "horse-cars" as they used to be called in the good old days, only disappeared from the streets of New York about a year and a half ago. Up to this time horse-cars were also used on Houston Street—the greatest attraction ever to out-of-town visitors. They talked about them for weeks and weeks and weeks.

HISTORIC ELECTRIC SWITCH-BOARD AND DYNAMO.



By J. Locketz.

THE electric switch-board, together with the 15 kilowatt generator shown in the accompanying photograph forms a very interesting link in the history of electric light and power development. This switch-board, as well as the dynamo, date back over thirty years and were used until recently by a western railroad when it was superseded by modern apparatus. The historic switch-board and dynamo have been donated to the Dunwoody Institute at Minneapolis.

The first thing that one notices on these old style switch-boards is that they are made of wood. A wooden switch-board was all right some years ago when 110 or 220 volts potential was considered a fairly "high" one, but nowadays when we have power developed at such tremendous voltages as 50,000 to 100,000, and even as high as 150,000 volts, there is required a better insulator than wood, such as marble.

The 15 kilowatt generator will be familiar to electricians as one of the famous old Edison machines of the bi-polar, vertical

(*Continued on page* 808)

A Wooden Railway Switchboard of Historic Interest. The 15 K. W. Edison Dynamo of Early Vintage, at the Right, Is Also of Interest. The Motor and Controller at Left Are of Modern Build.

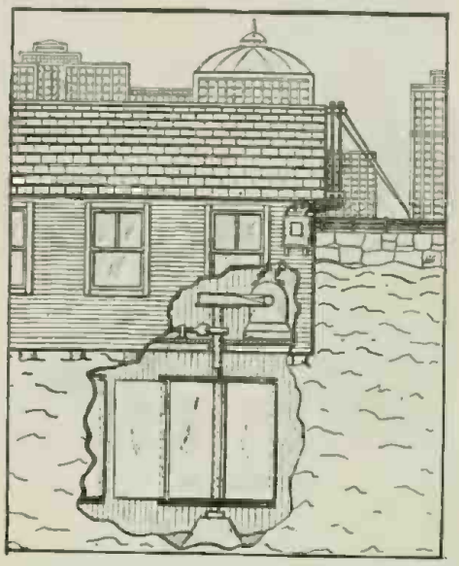
A "White Coal" Motor to Harness the Tides

From time immemorial men have been active in trying to evolve methods that will relieve humanity from physical toil. The worldwide campaign for increased efficiency is in a large degree dependent upon this same desire to be relieved from physical labor and there is a demand everywhere for cheap power, which can, as everyone knows, be best supplied by water power.

It is claimed by Government officials that the United States has more than 40,000,000 horse-power of undeveloped water power within its boundaries. If this is true, it represents an amount of power corresponding to the amount of energy that would be derived from about 300,000,000 tons of coal worth about $600,000,000 a year in the boiler furnaces.

© International Film Service



Model of the New Tidal Motor and Its Inventor, Mr. P. J. Griffin, of Boston, Who Is Seen at the Left. A Moving Current of Water Works the Device.

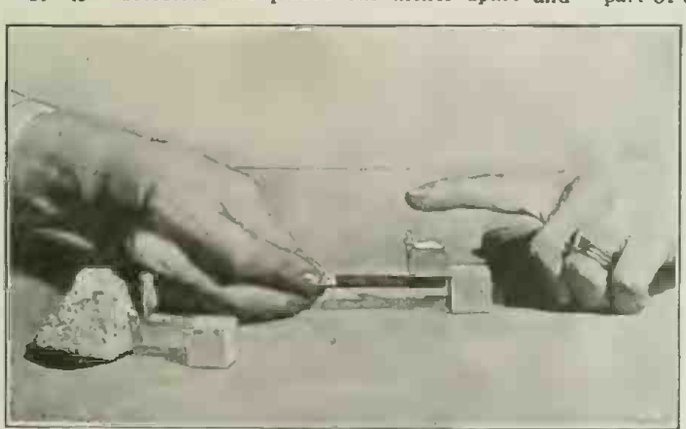
A new motor, shown in the illustrations, invented by Mr. P. J. Griffin of Boston, is designed to harness the energy of the tides and generate electricity by this means. The *White Coal Motor*, as it is known, is built on unique principles, being almost devoid of resistance. With this simple motor a farmer may harness the latent power of the nearest stream and generate his own electricity at very low cost. Flowing water is the only power used to generate the electricity.

Mr. Griffin, the inventor, is shown on the left in the photograph.

The inventor makes use of two sets of crosses, used as arms and mounted on a concave shaft. Secured between the outer ends of said arms are a set of flaps or wings; these wings or planes are held in place on one of their vertical edges between the outer ends of said cross arms by means of a rod (or pivot, to make a circle of 358 degrees from one side of the concave shaft to the other or opposite. On account of the above radius these wings or flaps take advantage of the same currents in its reverse, identically as that of the forward serving with the same continuous motion without any change whatsoever of any part of the device.

This invention is a cross or disk, not a wheel; it becomes a motor when wholly submerged in a current of water or fluids. The action of said forces upon the power producing planes or wings causes it to rotate and hence it becomes a wheel producing motive power on the upper end of an upright shaft. With this motor wholly submerged in water the inventor claims 1,500 h.p. to 60 square feet of surface of blades with between a five and six-mile current.

As Will Be Seen, This New Tide Motor Is a Cross or Disk. It Becomes a Motor When Wholly Submerged in a Current of Water. The Pivoted Wings Are Actuated by the Water Current, Thus Turning the Vertical Shaft, to Which a Dynamo Is Belted.



Insulating rods, tongs and similar appliances have been so perfectly developed to-day that linemen often work on charged wires carrying as high as 40,000 volts with comparative safety.

A "RADIUM DETECTOR."

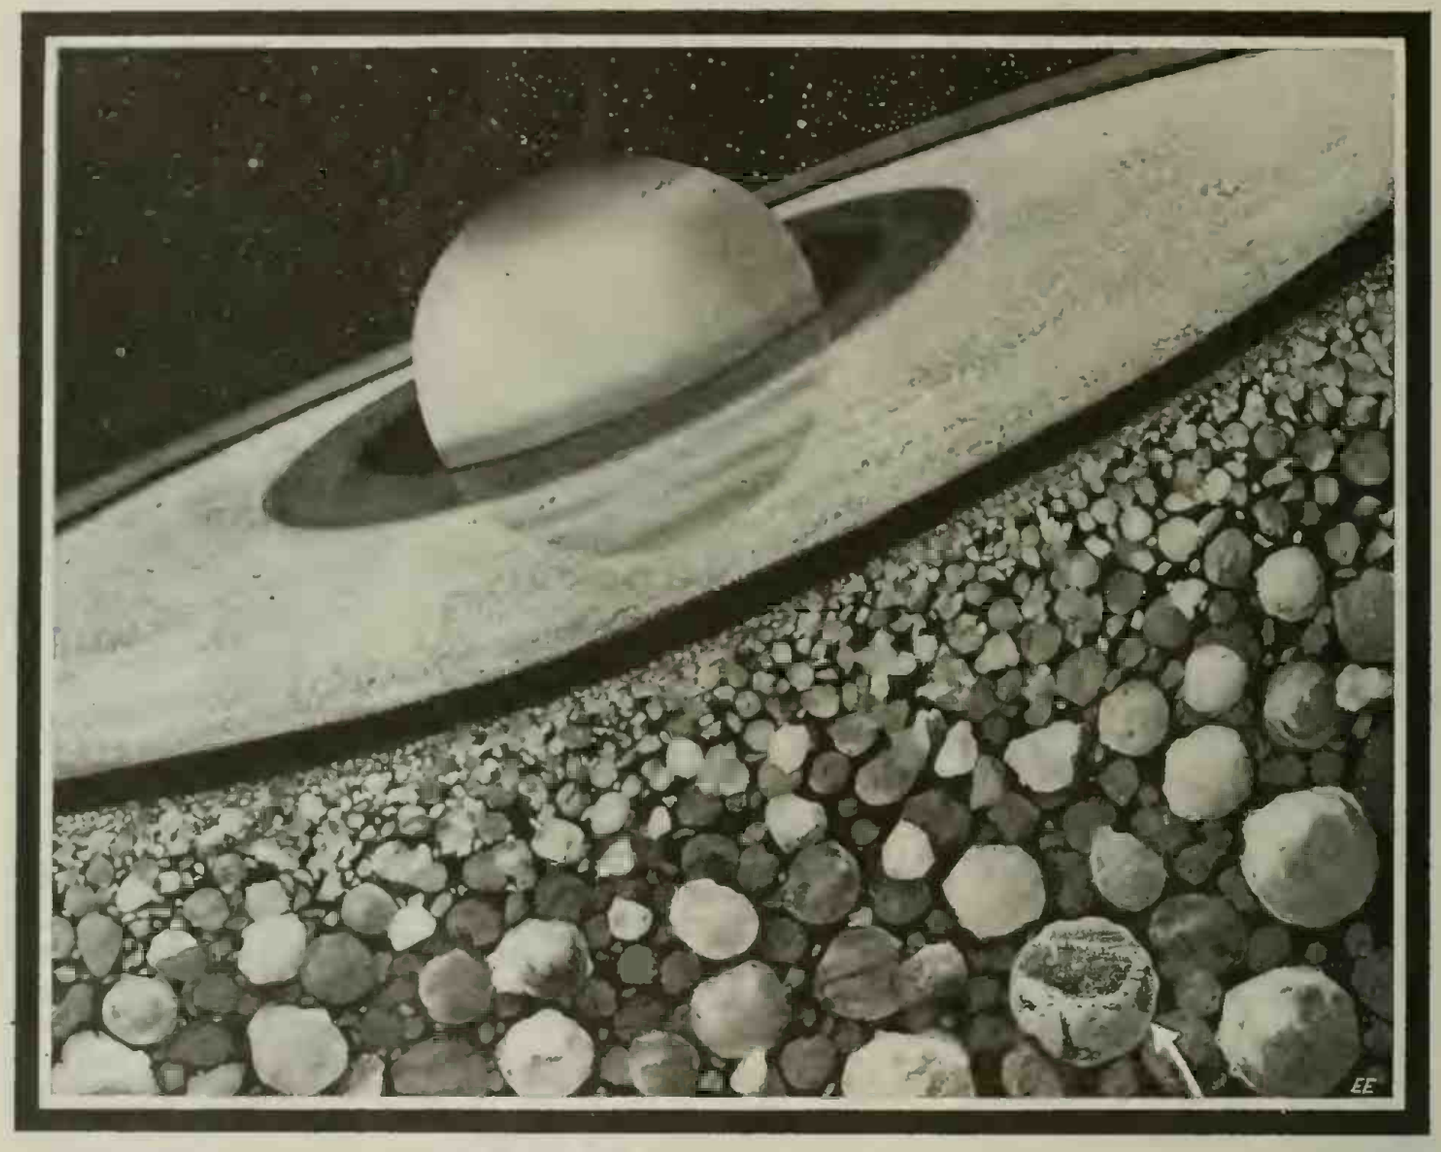
A new detector of *radioactivity* has been evolved by a California inventor, Mr. L. M. Karnasch, and it is a highly sensitive scientific apparatus, constructed on the principle of an Electroscope, by means of which it is possible to distinguish radioactive substances from others. It is claimed that the presence of radium in quantities less than 100,000,000th part of a pound can be detected with absolute certainty.

The Radium Detector consists of two insulating stands, to each of which is fastened a small "flag." A generator, in the form of a stick of electrite or hard rubber composition, 2¾ inches long, ⅝ of an inch in width, and 1/16 of an inch in thickness completes the outfit. The detector is mounted on a small sulfur compound block which forms a ¾ of an inch cube. A small piece of aluminum sheet extends horizontally ¾ of an inch from the cube and has a width of ½ an inch; it is bent into an "L" shape, the vertical side of which stands from each side of the upright aluminum ¼ of an inch above the top of the cube. There is a thin wire stretched taut across the plate and on this wire is placed a small "indicating flag."

Detection of the presence of Radium is accomplisht by the use of two of these detectors placed on a flat surface, preferably a glass top table and at a point of height, convenient for observation. The detectors are placed six inches apart and an initial charge is imparted to each one by means of the brisk rubbing of the generator stick between a folded piece of dry wool cloth or silk. The application of the generator to the detector causes the latter to become actively charged.

At Last! A Real Radium Detector. It Works on the Principle of the "Electroscope." Radioactive Substances Will Dissipate the Charge Rapidly on the "Test" Detector, Causing Its Flag to Fall.

After the detectors have become charged, the small flag raises and stands out in a horizontal position. The substance to be tested is placed under or near the metal part of one of the detectors, without touching it. The second detector is located about six inches away without any substance near it and it is used as a check upon the first detector. The flags of both detectors are then observed for a period of five minutes.



If the flag of the detector near which the substance or ore has been placed, drops from the horizontal position with greater rapidity than the "check up" detector, the substance is then radioactive. The strength of the radioactivity can be approximately determined with this detector by noting the period of time it takes to discharge the detector. The flags will fall in about 8 or 10 minutes when a weak radioactive substance is employed, such as Uranium Nitrat, while Carnotit and pitch blend will cause the flags to fall in from two to three minutes.

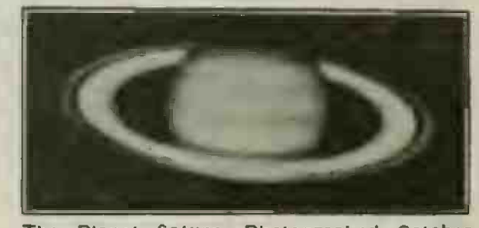
Popular Astronomy

Saturn—The Ringed Planet

By ISABEL M. LEWIS
OF THE U. S. NAVAL OBSERVATORY

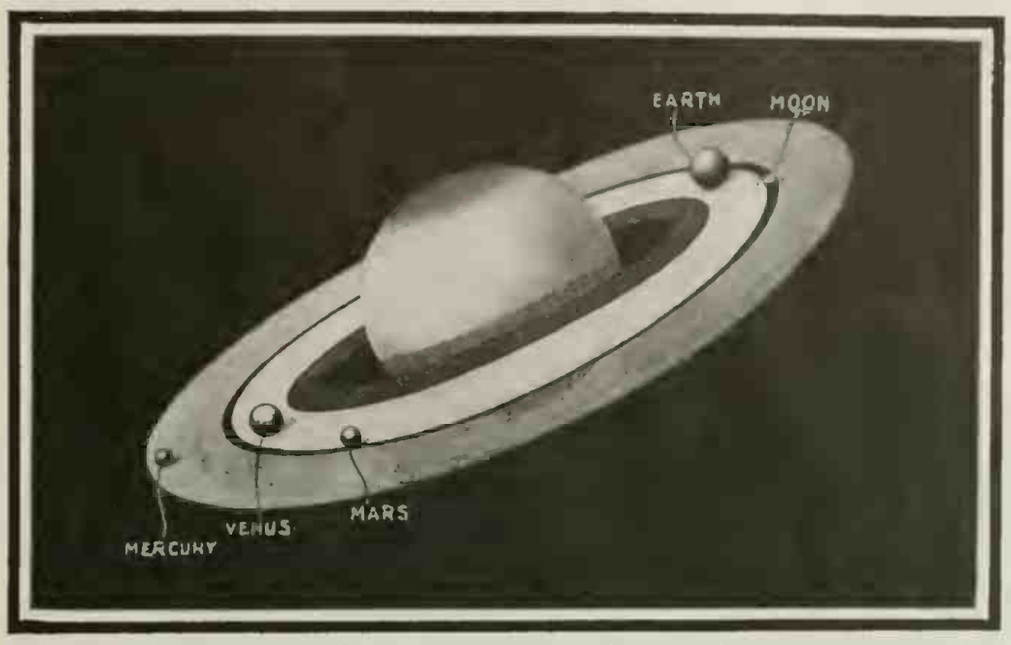


Very Recent Discoveries Tend to Prove with Irrefutable Evidence That the Rings of Saturn Are Not at All Solid as Has Long Been Thought. Instead, the Entire Ring System Is Made up of Tiny Little Moonlets, the Largest of Which Is Probably Not More Than Four Miles in Diameter. These Little Bodies in Their Rotation Around Saturn Revolve as Independent Bodies Floating Free in Space Without Touching Each Other. Collisions, However, Once in a While Are Bound to Occur. In Our Illustration the Arrow Points to One of These Little Moonlets, and in Order to Show Its Size, We Have Depicted Upon It the Lower Part of New York City, as It Would Appear if Viewed from Space about One Mile Above. This Illustration Strikingly Shows the Tremendous Size of the Saturnian system.

NEARLY everyone, with the exception of a few unusually earth-bound individuals, has felt at some time or other a strong desire to gaze at some of the beauties and wonders of the heavens thru a telescope and the one object that all of us wish to see, if, perchance, this desire is to be gratified, is Saturn, whose unusual ring system has so far as we know no counterpart in the sky.

All the planets in the solar system with the exception of the two innermost, Mercury and Venus, are attended by satellites but Saturn, alone, has in addition to a large and imposing family of nine moons, three distinct rings of great dimensions which form a total mass composed of swarms of minute particles revolving around the planet.

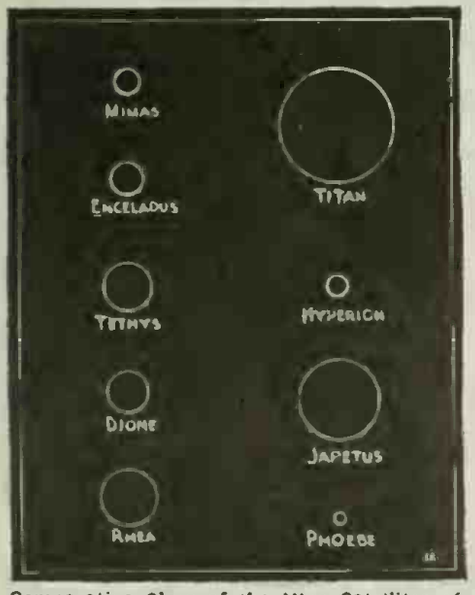
Why Saturn should be the only planet to possess such a system of rings has not yet been explained in an entirely satisfactory manner, depending as it does upon the manner of the origin of the entire solar system which it is now agreed could not have followed the course outlined by the Nebular Hypothesis of La Place. The theory of the origin of the Rings of Saturn is involved in the theory of the origin of the solar system and every theory advanced to explain the manner in which the solar system came into existence must satisfactorily explain the cause of this peculiar appendage of Saturn.



The Planet Saturn, Photographed October 1909 with Mt. Wilson 60" Reflector. This Is an Actual Photograph of the Planet.

There is an interesting law known as "Roche's Law," however, named from its investigator, that states that no satellite of a planet can exist intact within 2.44 . . . times the radius of the planet. This limit is spoken of as "Roche's Limit" and applying it to the planet Saturn we find that the rings of Saturn fall within this limit. It does not necessarily follow from this that the minute particles of which the rings are composed are the shattered remains of one small satellite but rather that they are the material from which a satellite might have been formed were it not so close to the planet. Within "Roche's Limit" the mutual attraction of the various particles for each other that would tend eventually to gather them into one body is overcome by tidal forces that arise from such close proximity to the huge planet. The stress and strain of such forces is so great that no grouping of particles can take place. This explains, possibly, why the rings continue

www.americanradiohistory.com



to exist in their present condition. The total mass of the rings is known to be very small, for they do not disturb the motions of any of the nearer and smaller satellites, tho tiny Mimas six hundred miles in diameter is only thirty-one thousand miles beyond the outer edge of the outer ring.

An interesting observation was made a year or so ago of the passage of the rings of the planet between us and a star. Tho the light of the star was diminished to one-fourth of its normal brightness when the rings past before it, at no time was its light entirely eclipsed by any of the particles. It was computed that if the diameters of any of the individual particles had amounted to as much as three or four miles the star would have been temporarily eclipsed. An upper limit for the size of the moonlets was thus obtained. The average diameter of the particles is probably much less than three miles.

In Order to Understand How Tremendously Large the Saturnian System Is, Our Artist Projected upon the Rings of Saturn All of the Minor Planets, Including the Earth. It Should Be Understood That These Rings Are Not Solid, But Are Merely Composed of Small Little Moonlets (See Large Drawing on Opposite Page). It Will Be Noticed That If All the Minor Planets and Our Own Moon Were Laid Side by Side, They Would Just About Cover the Breadth of Saturn's Rings. The Moon Is Just Wide Enough to Bridge the Gap Existing between the Outer and the Second Ring.

The thickness of the ring system is not over fifty or one hundred miles, but its total diameter is one hundred and seventy-two thousand miles. There are, in all, three concentric rings (see Fig. 1). The faint inner ring, known as the "crape" ring, is invisible in a telescope under four inches in aperture. According to extensive measurements by Barnard of the dimensions of the planet and its ring system the width of this inner ring is eleven thousand miles. Just beyond the crape ring is the chief, bright ring, eighteen thousand miles in width. It shades gradually in brightness from its juncture with the crape ring to its most luminous portion at its outer edge, which is separated from the third or outer ring by a gap two thousand two hundred miles in width, known as Cassini's Division. The third or outer ring is eleven thousand miles wide and is less bright than the central ring. The inner edge of the inner ring is but six thousand miles above the surface of the planet. On account of the curvature of the planet the ring system is invisible from the north and south pole of Saturn. As is the case with the satellites of a planet the inner particles of the rings revolve around the planet more rapidly than the outer particles. The innermost particles of the crape ring require but five hours for one journey around Saturn while the outermost particles of the outer ring require one hundred and thirty-seven hours, or nearly six days to complete one revolution.

Comparative Sizes of the Nine Satellites of Saturn, Arranged in the Order of Their Distances Outward from the Planets (Reading from Top to Bottom). Titan Is the Exact Duplicate of the Planet Mercury in Size, and Japetus Is Very Nearly Equal to Our Own Moon in Size.

In addition to the gap in the rings known as Cassini's Division several other fainter divisions exist. If a group of moonlets were to revolve around the planet in the positions marked by these gaps their periods of revolution would be commensurable with the periods of several of the satellites of Saturn. As a result the attraction exerted on such particles by these satellites would gradually disturb their motion in such a way as to draw them away from these positions. It is owing, therefore, to the attractions of the satellites of Saturn for the moonlets that these gaps in the rings exist.

It results from the disturbances produced in the motion of the moonlets by the other satellites of Saturn that collisions are bound to occur occasionally among the various particles. When two particles collide the period of revolution of one or both of them is reduced and as a result collisions tend to bring the moonlets gradually closer and closer to the surface of the planet. The dusky inner ring, it has been suggested, may consist largely of particles whose periods have been continually shortened by collisions.

Saturn may, therefore, lose its ring system in the course of time thru its gradually being drawn down upon the planet by collisions of the various particles until all of the material is finally swept up by the planet. Such a change would probably require millions of years, however, as collisions are probably, on the whole, infrequent. It is possible that the ring system of Saturn may have been much more extensive in the past than it is now and other members of our solar system may have had such appendages in the far distant past.

The appearance of the rings of Saturn as viewed from our planet changes periodically as a result of the revolutions of the earth and Saturn around the sun, which places them in constantly changing positions with reference to each other. The rings lie in the plane of Saturn's equator, which is inclined twenty-seven degrees to its orbit and twenty-eight degrees to the Earth's orbit.

Since the position of the equator remains parallel to itself while the planet is journeying around the sun it happens that half the time the earth is elevated above the plane of the rings and the remainder of the time it lies below the plane of the rings. Twice in the period of Saturn's revolutions around the sun, which occupies nearly thirty years, the earth lies directly in the plane of the rings and at this time the rings entirely disappear from view for a short time. The last disappearance of the rings of Saturn took place in the fall of 1907 and the next disappearance will occur in November, 1920. Between these two dates the southern surface of the rings remains the visible one. Half way between the two dates of disappearance the rings are tilted at their widest angle with reference to the earth and they are then seen to the best advantage. They are now becoming narrower and narrower and as the date of their disappearance approaches they will appear more and more like a line of light extending to either side of the planet's equator. Even in the most powerful telescope the rings entirely disappear from view for a few hours at the

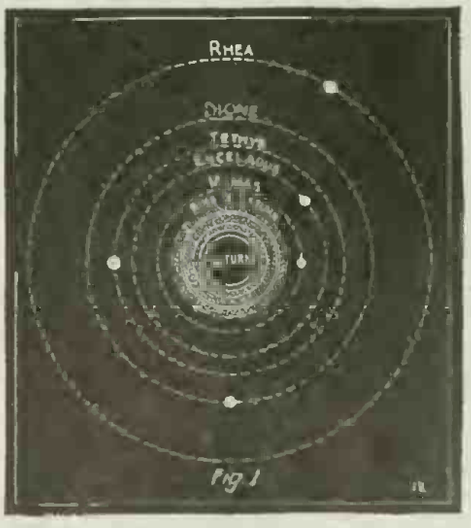


Fig. 1 Shows the Dimensions of the Ball and Rings of Saturn and the Orbits of the Five Inner Satellites.

time the earth lies exactly in the same plane. It is at this time that the ball of

How Jimmy Saved the Bank

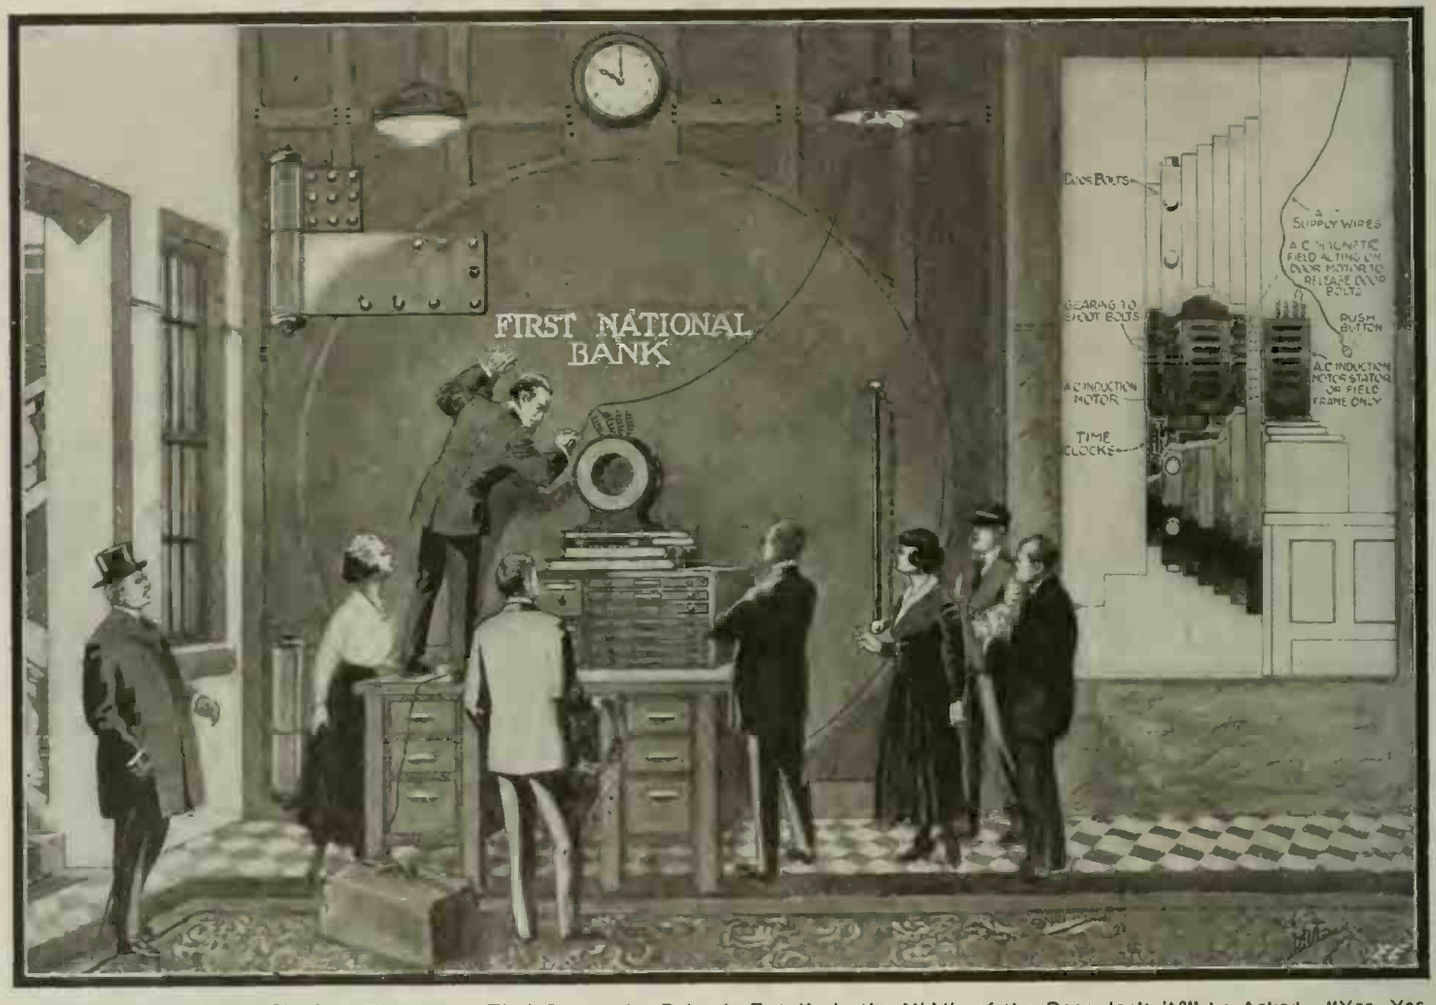
By F. W. RUSSELL

As the hands of the big clock in the office of the First National Bank pointed nine, old Mr. Hutchinson past between the long rows of desks towards the door of the big burglar-proof safe. For the last ten years he had past along that same isle and at exactly the same hour. He reached the door and put his hand on the huge nickle-plated handle, by means of which the door was pulled open. The great weight was so delicately balanced that only a slight pull was necessary to open it, but this time it did not yield to the usual effort; Mr. Hutchinson applied all his strength to the task, but the door did not yield an inch. What could be wrong?

Mr. Wallace, the president of the bank had wanted an absolutely burglar-proof safe, so his brother, an Electrical Engineer, had undertaken to design one, which he claimed would foil the efforts of the most ambitious cracksman. It had a marvelous time-lock consisting of five clocks timed to a hair. These, beginning at fifteen minutes to eight, closed five different contacts in a special motor circuit; that is, the first contact was closed at a quarter to eight, the next at exactly eight, and so on at intervals of fifteen minutes, until the last contact was closed at a quarter to nine, starting an induction motor which drew the bolts. The current for this motor was brought in thru the top of the safe. Two holes had been made here which were comparatively small at the top and bottom but which bulged out at the center. Heavily flanged brass rods had been set in these holes and porcelain molded around them. These were protected by a thick layer of concrete which covered the safe on all sides, excepting the front. The current which operated the clock contacts, was supplied by a small storage battery kept in the safe and charged every day.

Mr. Hutchinson's first thought was that he might have been too soon, tor even his almost machine-like actions might have for once been at fault, but no, the huge clock above the safe by which the time mechanism was set every evening, showed exactly twelve minutes to nine. The safe was three minutes late already! He tried the door again in order to be sure that he was in no way at fault, for he took great pride in his reputation for punctuality and promptness, and to his mind nothing could be more humiliating than to be laughed at by some of the bank clerks simply because of some thoughtless mistake. But his utmost exertions were futile. The giant door did not yield a fraction of an inch. He proceeded hurriedly, to keep from being questioned, to the office of Mr. McGinnis, Mr. Wallace's secretary, who took charge of affairs when his chief was away.

"Mr. McGinnis," he gasped breathlessly, "the safe won't open!"



Mr. McGinnis gazed at him in blank astonishment.

"No sir! no sir!" He raced on, getting his breath in gulps. "I went there at the usual time sir, and the door would not give. I know I was not ahead of time, for I waited nearly five minutes and tried again. I pulled with all my might, sir."

He paused and looked inquiringly at the secretary, who had sunk into one of the large leather arm chairs against the wall, and sat gazing at the floor. Suddenly he got up and looked at his watch, started to sit down again, changed his mind and began to pace the long office thoughtfully. Mr. McGinnis was a man who had never in the experience of anyone, been known to become visibly excited, but Mr. Hutchinson could see that he was now making a strong effort to contain himself. Finally he came to a halt before Mr. Hutchinson, and with his eyes still on the floor he began:

"Hutchinson, that safe must be opened! I have no idea what can be the matter; I have no idea how to open it—but it must be done. There are some papers in there that must be gotten at by noon, or we will be practically ruined. We can borrow enough money to carry us thru the day, but those papers have got to be attended to. Mr. Wallace as you know, left yesterday morning for a short cruise on his yacht. I do not think he knows of any way to open it, but it would be best to ask him and inform him of the situation."

"Ask him? How are you going to ask him?" inquired the impatient Hutchinson.

Jimmy Turned to Mr. McGinnis—"That Motor That Draws the Bolts is Exactly in the Middle of the Door, Isn't It?" he Asked. "Yes, Yes, Exactly. . . . But What are You Going to do?" Said Mr. McGinnis. All Eyes Were Turned Inquiringly on Jimmy, Who Stood on the Desk Holding a Push Button in His Hand and Listening Intently With His Ear Glued Against the Door. Suddenly a Low Hum Was Heard and Then a Click Which Was Unmistakable. A Cheer Burst From the Surrounding Bank Attaches—Jimmy Had Saved the Bank.

www.americanradiohistory.com

Mr. McGinnis looked at him reprovingly. "He keeps in touch with his home thru his son Jimmy's wireless. We will go and see him at once; you must go with me."

They left the building together and hailed a passing taxi. After giving the direction, Mr. McGinnis settled back in the seat with the outward appearance of a man without a worry. Mr. Hutchinson sat with clasped hands, and silently shook his head. He had no faith in this wireless business, or in fact in anything, now that the safe which had always been his pet had failed him. They stopt on the way, and Mr. McGinnis explained the situation to the Citizens National Bank, securing a sufficient loan to carry them thru the day. The car soon cleared the crowded down-town district and sped along the smooth streets, until after a short ride it drew up before the white marble home of the Wallaces.

The door was opened by John, the butler, who informed them that Jimmy was at home. He was at that moment in his workshop, or in good American, his "joint."

Was the gentlemen's business very important? It was. Well John might venture into those dangerous regions if that was the case. John went off slowly showing no enthusiasm for his task. There were memories still fresh in his mind of electrified door-knobs that stuck to the hand, and one rug in particular on which he had shown a surprising amount of activity. He approached the door cautiously and knocked.

"Hello, who is it?" came a voice from within.

"Mr. McGinnis and Mr. Hutchinson are down-stairs wishing to see you."

"I can't come down, am too busy; tell them to come on up." Jimmy said this last standing in the open door. He was a tall slender young fellow, but well built, with a shock of brown hair, above a pleasant face. He was a typical "Bug"—always had a binding-post or a piece of wire in his pocket, and spent all his time collecting "junk" or "making somethin."

Mr. McGinnis and Mr. Hutchinson were shown up and entered the room. It was a regular "joint" all right; wire on the floor, hung from the ceiling and draped along the walls, switches nailed up here and there, and tables and chairs covered with tools and apparatus. Jimmy swept two chairs clean, but his visitors remained standing.

"Jimmy," the secretary began hurriedly, for the first time in many years not pausing to weigh his words, "The bank is in great danger. The safe won't open and there are some very important papers in it which have to be attended to. I want you to call your father, and ask him if there is any way to open it. You can get him, can't you?"

"What's this, you say, the safe won't open?" burst out Jimmy, looking dazedly at Mr. McGinnis.

"Yes, yes, and I want you to ask your father if he knows any way to open it. I say, you can get him, can't you?"

"O, sure, of course, just a minute." Jimmy dashed to his wireless table and threw in the antenna switch. In a moment the hum of the rotary gap was being drowned by the high-pitched spark, as the call of his father's yacht was being tapt out rapidly. After the second trial Jimmy was answered by the Yacht's radio operator.

After a few minutes, Jimmy rose from the table with a downcast look. The two men could read his mind before he had opened his mouth. "He don't know—he's all excited. That's natural enough tho. He's coming right back." Jimmy stood for some time looking at the floor in a thoughtful attitude. Finally, as Mr. McGinnis started to go, he called him back. "Wait a minute, there ought to be some way to open that safe; sit down and think; there is no use getting excited."

Mr. McGinnis was far from being excited. "There is no use," he said, starting to go again. "You know how your Uncle brags about that safe, and he knew what he was doing when he designed it. We will just have to wait and see what happens."

"No, you have got the wrong dope," said Jimmy, his right hand idly turning the rotor (revolving member) of a medium size 220-volt induction motor on an adjacent table. "I'll admit that my Uncle is a bright man, but he may have mist something. Let's see; that storage battery must have gone wrong because that motor is as simple as they go. You know an induction motor has—oh! I've got it! maybe?"

Mr. Hutchinson gazed at him in wonder. Mr. McGinnis after his first astonishment rushed up to him and grasping him by the shoulder, stammered out, "What—what—what do you mean?"

"Don't bother me," said Jimmy, busily rolling up a long extension cord, "just tell me, have you got 220 volts A. C. at the bank?"

"Yes, yes," stammered Mr. McGinnis. "Yes, but what——"

Mr. McGinnis obeyed, and Mr. Hutchinson trailed out after him, not having recovered his senses as yet. The car was out in front and the two got in. In a moment Jimmy came running down the steps with a large black bag, which was apparently very heavy. The big car dashed thru the streets, narrowly missing several bewildered pedestrians and shaving passing vehicles by the fraction of an inch. As the car drew up in front of the bank, Jimmy was out over the door in an instant, dragging his bag along with him. When the secretary reached him, he was busily running the extension cord from a near-by lamp socket to the safe, in the mean time warding off a swarm of inquisitive bank clerks. When he had finished and had attached the two loose cord ends to two more protruding from the motor, he turned to Mr. McGinnis—"That motor is exactly in the middle, isn't it?" he asked.

"You mean the one that draws the bolts? Yes, yes, exactly; I remember that from when your Uncle explained it to me. What are you going to do?"

"Roll one of these desks over here", was all the answer they got. The order was obeyed by half a dozen clerks, who soon had one of the big flat tops on the required spot. By piling some large books and a file cabinet on top of this, the required level was soon attained. Jimmy lifted up his bag and took something out of it.

Just then a little man in great excitement burst thru the group. "Good heavens!" he exclaimed. "So it is true. I couldn't believe it. What are you doing, James, my boy!"

"Little idea of mine, going to try to open it," said Jimmy, "don't get excited tho; it may not work."

"Going to try to open it?" Mr. Wallace queried dazedly. He had just arrived and had driven to the bank at top speed.

"Ugh, ugh," said Jimmy. Then turning around, "Give us a little juice over here, one of you fellows!" In the scramble which followed some one accidently pushed the button, and the juice was on.

All eyes were turned inquiringly towards Jimmy, who stood on the desk holding a push button which was connected to a round black object on top of the pile of books. Suddenly, he prest the button and bent his ear to the door of the safe; a low hum was heard on the inside and then a click, which was unmistakable.

A cheer burst from the surrounding clerks, and as the desk was rolled away, Jimmy grasped the big nickle plated handle and swung the door wide open. But the mystery was yet to be explained and all eyes were again turned on Jimmy.

"How did you do it, son? How did you do it?" gasped Mr. Wallace, looking with mingled wonder and pride at his young hopeful.

"Oh, it's nothing!" said Jimmy, "You see an *induction motor* has no electrical wire connection between the field and the armature." All nodded understandingly. "And so I figured that if I used a bigger and more powerful field, I ought to be able to spin that armature from the outside; so I just lined them up and you know what happened. Simple little thing, isn't it, when you come to think about it?"

"James, you know that thing—that transformer you were longing for in that catalog the other day? How much does it cost?" asked Mr. Wallace, as he sat down and began to fill out a check.

(THE END)

THE APRIL NUMBER "E. E."

The April number of the ELECTRICAL EXPERIMENTER *will abound with new and refreshing articles. Among those in preparation there are the following attractive contributions:*

"My Inventions"—No. 3 of a series by Dr. Nikola Tesla, the eminent electrical scientist. This paper will describe his wonderful discovery of the "Revolving Magnetic Field"—the forerunner of the Tesla induction motor, which has revolutionized the electrical power industry.

"Do Wireless Waves Travel Above the Earth or Thru It?", by Dr. Lee de Forest. An exclusive feature article which you can't afford to miss.

Electricity—the Hotel Servant of a Thousand Uses. How it furnishes every conceivable want to the hotel guest—all at the push of a button.

"New X-Ray-less Photography of the Bones", by Charles Battell Loomis.

"Will Man Freeze the Earth to Death? Can He Exhaust the Heat-Giving Radium?" by E. T. Bronsdon.

"The 'Noiseless' Phonograph — it don't annoy the neighbors"—by Thomas Reed.

"'Putting It Over' on Fritz. Some radio and other tricks of the war," by K. K. Sammerin.

"New French and American Audions".

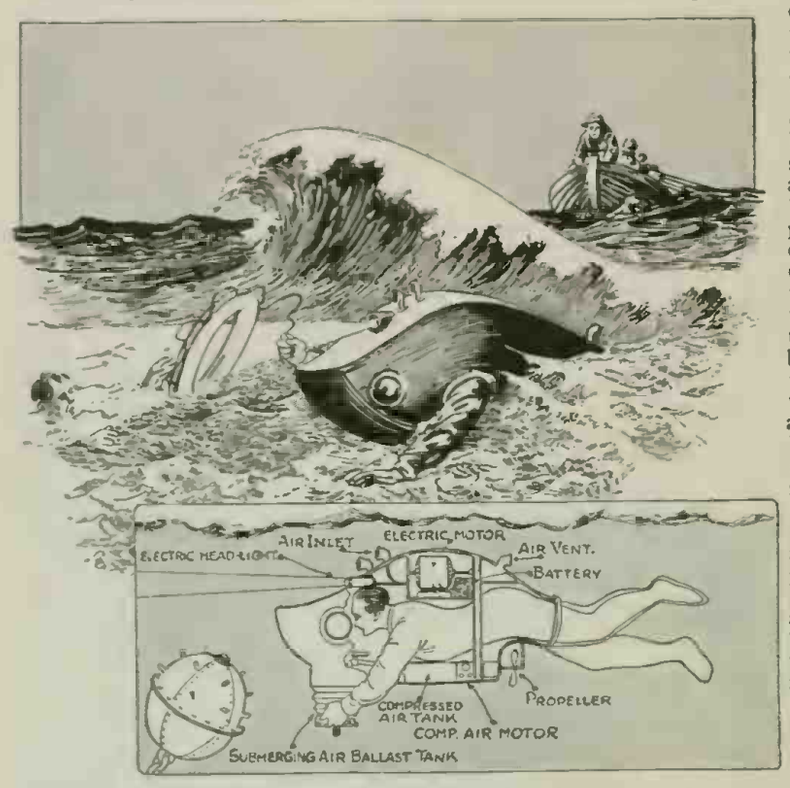
"A New Lightweight Commercial Radio Transmitter".

"Experiments in Radio-activity", Part III, by Ivan Crawford.

"Some New Regenerative Vacuum Tube Circuits", by Samuel D. Cohen.

Besides "Experimental Mechanics", New "Experimental Chemistry Questions and Answers", "Physics".

DO IT ELECTRICALLY.



When Milli Ampere first saw Volt
  Her charms past all resistance.
A spark coiled in his heart poor colt—
  He needed prompt assistance.
And she, tho plighted to old Watt,
  Could alternate affection,
So let her eye bolt glances hot,
  Right in poor Volt's direction.
The current of Watt's wrath flowed strong!
  He vowed Volt should not meter.
For daughter Poly Phase had long
  Hoped that Volt would be sweeter.
And so to Milli Ampere, he
  A stern note did transmitter,
Requesting she transform, and be,
  If possible, less bitter.
So Milli Ampere flirted not,
  But knew that it was wise
To regulate the rage of Watt
  And with him synchronize.
Then Volt with Poly Phase did fuse—
  From her he did not roam.
They rectified divergent views
  And started a small Ohm.

—W. F. Leggett, in Western Electric News.

Submersible Boat Resembles Sea Monster

THE peculiar looking submersible one-man boat shown in the accompanying view has for its primary object, so its inventor, Mr. Worth R. Barringer, of Denver, Colorado, states—to provide a vessel of this character constructed so as to contain a single occupant and provided with suitable means whereby submergency of the vessel as well as its travel thru the water may be controlled by the occupant. He mentions, among other advantages, that it should prove useful and convenient for submarine observations and in the removal of submerged mines and for various other similar and analogous purposes. Also the inventor claims that his device can be used as a diving suit, and can be readily donned by the individual.

With a Little Ingenuity Amateur Mechanics Can Construct a One-Man Submersible Boat of the Type Here Shown. The Arms and Legs Fit into Flexible Rubber Extensions, the Same as in a Diving Suit. An Electric or Comprest Air Motor May Propel the Device.

The body of the submersible diving suit is preferably made of aluminum. The front or nose portion of the body is provided with transparent panes or windows, as shown, thru which the occupant can see either to the right or left and forward. Suitable rubber or other flexible water-proof compartments are adapted to receive the lower limbs of the operator. An electric motor is arranged to operate a propeller, the motor receiving its current from a storage or other battery. But this is not all. The inventor takes Time by the fore-lock and practises safety first. He also supplies a comprest-air motor with a storage tank containing air under high pressure for operating it, all of which is used to drive the propeller. Suitable vents are provided for the efflux of vitiated air as well as air inlets or ventilators, which are arranged in the top wall of the body. These vents are fitted with suitable valves, such as the float-ball type, which will automatically close, due to the pressure of the water upon submergence. An electric light bulb is also arranged in the top of the body, which is supplied with current from the storage battery.

Sleeves made of rubber or other suitable flexible material are attached on the front of the body on either side to accommodate the arms. These are fitted with suitable gloves to receive the hands of the operator. To submerge, the "human fish," a collapsible tank is arranged on the under side of the body. The tank is equipt at its lower end with suitable valves and hand-holds. There is also provided a pipe connecting the comprest air tank to the upper end of the collapsible bellows tank, in which pipe line there is placed a suitable valve. When it is desired to submerge, the bellows tank is collapsed, the air being expelled from the tank thru suitable valves. This results in the displacement of the vessel, so that it will submerge. When the operator desires to rise to the surface, he withdraws his arm from one of the sleeves and opens a comprest-air pipe valve from the storage tank into the collapsible bellows tank, thus expanding it and causing the vessel to rise, owing to the increased buoyancy.

Finally, the inventor mentions that it will of course be understood that the vessel may be provided with an oxygen supply tank, so as to afford an ample supply of oxygen during prolonged submergence of the vessel. If there is anything under the heavens that this inventor forgot, we have failed to perceive it in looking over his patent, but he might have conscientiously attached a 69 cent alarm clock to the rear wall of the inner compartment so as to arouse the submarine explorer from prolonged slumber, which might result disastrously in the event the "ship" became uncontrollable and started off on a long journey toward foreign shores. We presume the sailor carries sufficient tea biscuits in his box to weather the voyage, and providing he has the foresight to procure a few dozen choice tea and bouillon capsules as adapted by the United States Army for emergency rations, he should have a delightful cruise. *Bon voyage!*

PREDICT AERIAL MAIL SERVICE BETWEEN EUROPE AND AMERICA.

All mails between Europe and the United States eventually will be carried by airplane, according to Lord Morris, who has championed a movement before a Parliamentary committee for the establishment of a port of call for Atlantic aërial liners on the west coast of Ireland.

Already, he says, a regular daily mail service by airplane is maintained between England and France without interruption by the weather.

BRITISH TANKS CARRY THEIR OWN "CARPET."

The photograph herewith shows a giant British tank ready to go into action. This tank is fitted with a new superstructure, which comprises a rugged steel wire timber "carpet." It is used to breach shell-holes, gulleys and trenches, in making advances over rough ground. This "carpet" is quickly unrolled when needed, and is very effective on muddy ground. The giant caterpillar treads or belts do not grip into the mud when the carpet is used, and thus one of the greatest drawbacks to the use of the tanks has been overcome. This photograph is one of the most remarkable taken during the war and shows British infantry reinforcements accompanied by tanks, all awaiting orders to "get into it." The smoke from the battle almost obscures the tanks and men in the background of the picture.

© Underwood & Underwood

Unhampered by the Heavy Shellfire, This Re-enforcement of British Infantry Has Been Brought to the Front and Are Awaiting Orders to Get Into It. One of the British Tanks with the New Superstructure, Which is Used to Carpet the Mud Which the Caterpillar Wheels Do Not Grip, Is Advancing. The Smoke from the Battle Almost Obscures the Tanks and Men in the Background of the Picture.

Experimental Physics

By JOHN M. FURIA, A. B., M. A., (Columbia University)

LESSON NINETEEN

Radio-activity—Experiment 108.

WRAP a photographic plate in a piece of perfectly opaque black paper. Lay a coin on top of the paper and suspend a pinch of the mineral Uranium a little above the coin. Set this aside for a few days, after

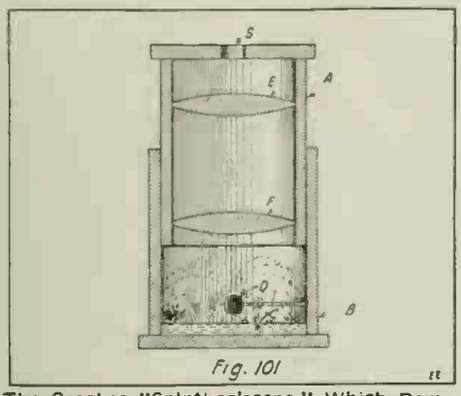

Fig. 101

The Crookes "Spintharlscope," Which Demonstrates In a Popular Way the Wonders of Radium. These Can Be Purchased On the Market.

which time develop the plate. A shadow picture of the coin such as one would obtain after exposure to X-rays will appear on the plate. This is precisely the experiment that Henri Becquerel, of Paris, performed in 1896, which led him to the conclusion that *Uranium is a source of rays that affect photographic plates and which have the power of penetrating opaque objects just as X-rays do.* The rays are known as *Becquerel Rays*, after their discoverer, and the phenomenon is called *Radio-activity*. Shortly after Becquerel's discovery Madame Curie, of Paris, assisted by her husband—Prof. Curie, made an investigation of all the known elements to ascertain which of them possest this same remarkable property that Uranium possesses. She found that *Thorium* in any of its compounds was a radio-active substance (Thorium is the chief constituent of Welsbach gas mantles). During the investigation Madame Curie noticed that *Pitchblende* (the crude ore from which Uranium is extracted) which consists of Uranium Oxid to a great extent, discharged her electroscope (a test for radio-activity) about four times as fast as pure Uranium does. She concluded that the radio-activity of pitchblende was due to some unknown element in it more powerfully radio-active than either Uranium or Thorium. After a tedious and difficult research she succeeded in separating a few hundredths of a gram of this hitherto unknown element from several tons of pitchblende. This new element which she named *Radium* proved to be a million times more radio-active than Thorium or Uranium. Radium has attracted the attention of the foremost scientists the world over.

Before proceeding with the following experiments let us note carefully the following characteristics of Radium. The Radium atom is heavier than any other atom. Radium constantly emits three distinct kinds of rays namely alpha, beta, and gamma which I shall refer to by α, β, and γ respectively. α, β, and γ rays all affect photographic plates, discharge a charged electroscope and are deflected by magnetic fields. α and β, both impart electric charges to bodies they come in contact with. In particular, the α rays are not as penetrating as the β and γ rays; they are deflected by a magnet in a direction opposite to the direction of deflection of β rays and travel at about 20,000 miles per second. The β rays are like cathode rays and they travel at from 50,000 to 180,000 miles per second. The γ rays are not deflected by a magnet but they have greater penetrating power than either the α or β rays. From these properties we conclude that α rays are streams of positively charged particles (atoms of Helium); β rays are negatively charged particles like cathode rays, i. e., electrons and γ rays are irregular pulses like X-rays.

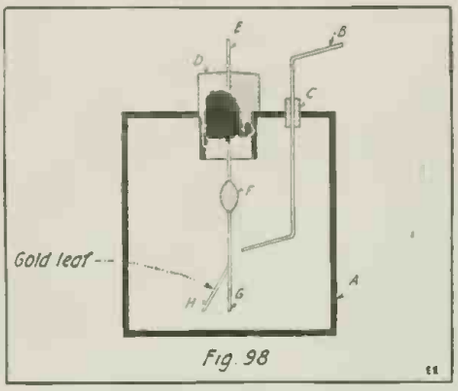

Fig. 98

A Sensitive Model of Gold-Leaf Electroscope Suitable for Use In Radio-Active Measurements.

Experiment 109.

The goldleaf electroscope, one of the oldest electrical measuring instruments known and which was described in the lesson on "Static Electricity," was used merely as a detector of the presence of an electrical charge. This same instrument in a delicate form is used to measure electric currents of very small magnitudes where other instruments fail. In Fig. 98, A is a metal case (a cocoa can serves admirably; in fact an authority on the subject of radio-activity made the statement that he secured better results with a home-made cocoa can electroscope than with the fancy priced, highly polished commercial instruments). A metal rod E (about 1/32 inch in diameter) passes thru an insulating plug D, made of ebonite, amber or sulfur. C and F represents insulation of the same material as D. B and G are metal rods like E, bent as in the figure (hairpin with the enamel scraped off is quite satisfactory). H is a narrow strip of gold or aluminum foil about one and one-half inches long and 1/32 inch wide. (The narrower the strip the more sensitive the electroscope). To cut the aluminum or gold foil the following method has been found best. Place the foil between two sheets of thin paper. Press the edge of a razor flat against the "sandwich" and carefully saw

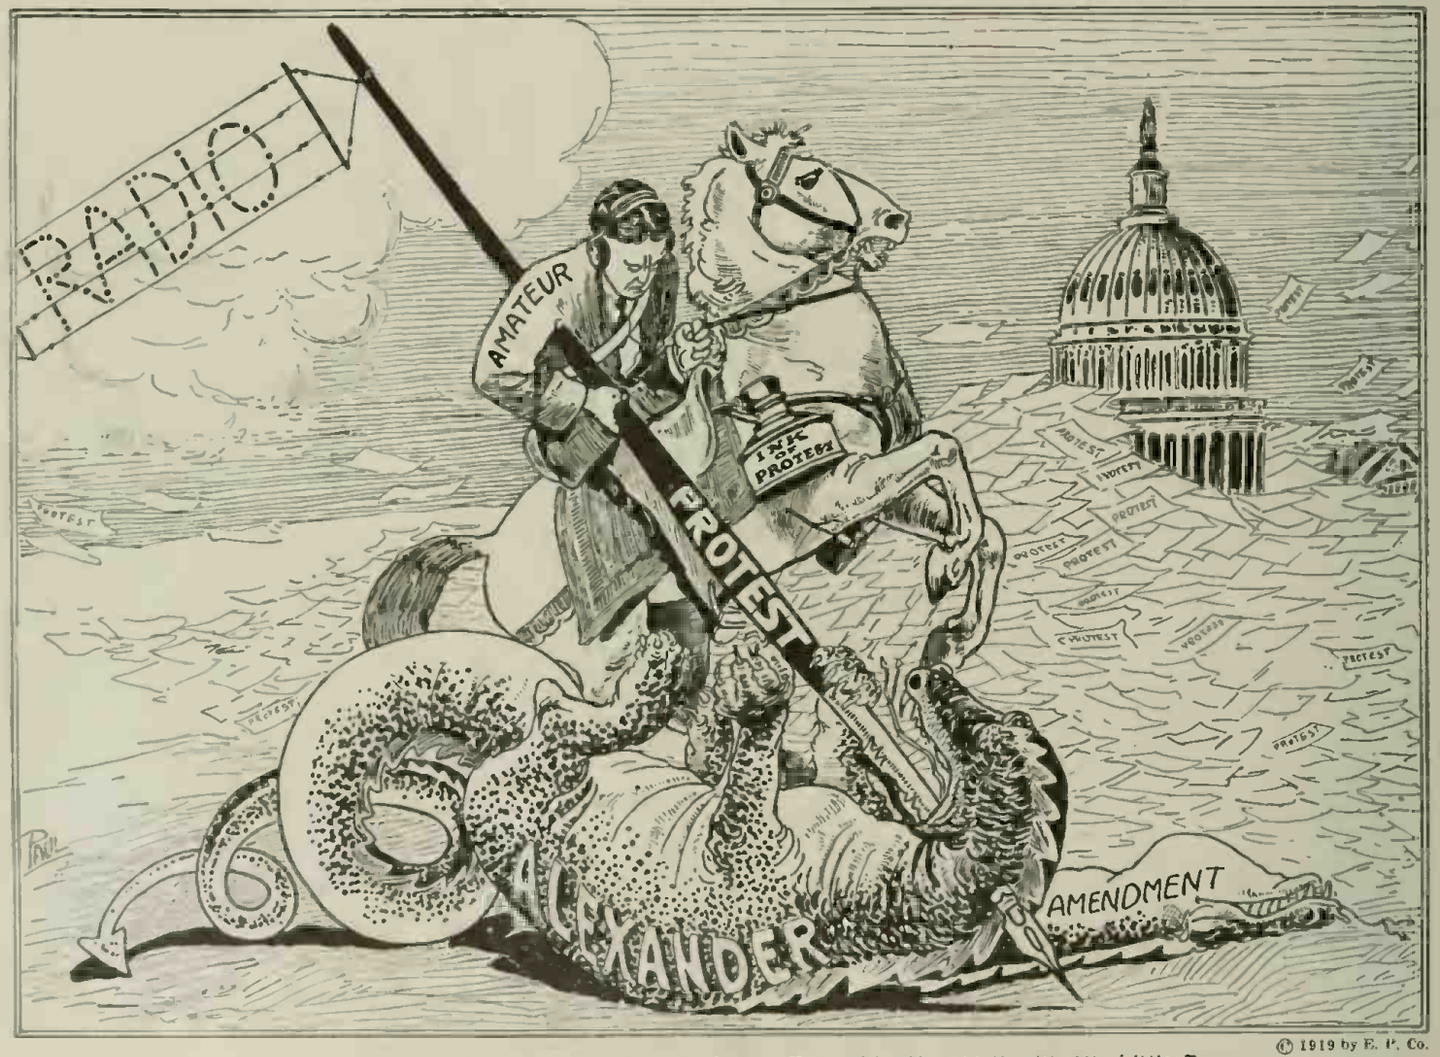
Alexander Wireless Bill Is Killed

By H. GERNSBACK

THE Alexander Wireless Bill and its amendment as reported in our last two issues has been killed. On January 15th the Merchant Marine Committee and the House of Representatives gave the Administration's movement toward Government ownership of public utilities a very definite set back. By unanimous vote it tabled the bill which was to authorize the Navy Department to take over and operate permanently all radio stations.

As our readers will remember from our January issue the bill was sponsored and urged by Secretary Daniels. Repesentative Bankhead made a motion to table the bill and Chairman Alexander characterised the proposed plan as "a hopeless task." He added: "In view of the sharp difference of opinion both in the Committee and in the House on this subject, it would be impossible to put the bill thru at this session."



As our readers will remember from our January issue, the original Alexander bill proposed to make all wireless stations Government owned, and the present wireless law, the act of 1912 was to be changed to such an extent that the amateurs were to be eliminated entirely from the Radio field.

The Alexander bill and our views thereof were printed in full in our January issue. As this issue, however, did not appear on the news-stands until the 15th of December, and inasmuch as the hearings on the bill began a few days earlier before Mr. Alexander's Committee at Washington, the ELECTRICAL EXPERIMENTER sent out some 50,000 letters to amateurs apprising them of the impending measure. This movement had its immediate result, and official Washington was deluged with a storm of protesting letters, which not only reached Mr. Alexander's committee but every Congressman and Senator of the United States as well. This unparalleled unity of the American amateurs had an instantanous effect in Washington, and even before the hearing started, a number of amendments, all of which favored the amateur more or less were rushed thru, printed and distributed.

There were at least three amendments of which we have record. One of them, the last one dated December 11 was printed in full in our February issue. Before the hill was definitely killed, however, we had information which tended to show that the Government was not ready to make wireless a Government ownership affair. As far as the amateur was concerned we were not at all disturbed, for we said:

"As a matter of fact as things stand

America's Greatest War Invention

The Rogers Underground Wireless

(Special Interview to the ELECTRICAL EXPERIMENTER.)

By H. Winfield Secor
(Associate Member Institute Radio Engineers.)

An invention which has been termed the greatest American war achievement is the Rogers underground and sub-sea radio system. The Rogers system does away entirely with aerial wires, and it is only a matter of months now before all aerial wire systems the world over will be pulled down. Wonderful things have been accomplisht by the new Rogers underground system, chief of which is the total elimination of static and the increase of the loudness of received signals, which is often as high as 5000 times the usual strength. Interference, too, is done away with almost entirely now. The Rogers invention is of tremendous importance and revolutionizes our previous ideas on wireless to an extent never dreamt of before. We urge every one interested in radio to read the accompanying authoritative article which discloses the full technical data on the new system for the first time in any periodical.

THE greatest invention in the field of wireless telegraphy since Marconi first placed commercial radio-communication on a firm basis by his historic experiments in Italy, and later in England, is without a shade of doubt this latest triumph of radio research—the "Underground and Sub-sea Wireless", conceived and developed to a working stage by an American scientist and inventor, James Harris Rogers. Mr. Rogers is known as a second Edison, among his towns-people in Hyattsville, Maryland, where he has lived for many years, and now the whole world acclaims him.

It Is Revealed Now That the Navy Department Had Been Using a Powerful Undersea Wireless During the War. The Instruments and System Were Invented by James H. Rogers, of Hyattsville, Md., and were Adopted by the Navy Department as an Invaluable Addition to the Wireless System of the Navy. The Two Lower Photos Show the Inventor, Mr. Rogers, in His Laboratory at Hyattsville.

Who is Mr. Rogers?

James Harris Rogers, practically unknown a few years ago in radio circles, except by a few select radio men who were investigating his invention for the Navy Department, has practically become overnight the center of all attractions in the field of science. Mr. Rogers is a son of the confederacy and a veteran of the great Civil War. He has followed electrical experimenting ever since and has been a strong devotee of radio telegraphy since Marconi performed his first experiments in this new branch of applied science. He is a refined, cultured southern gentleman who makes you feel at home at once; an invariable attribute of all of the truly great. Mr. Rogers was one of the first inventors of the "printing telegraph" and his full-sized working models saw actual commercial service on a circuit between Baltimore and Washington, also in New York, back in 1880. These were seen by the writer and are wonderful pieces of mechanism.

The Rogers laboratory, which comprises several large rooms, is lined on all sides with glass cabinets containing electrical apparatus which he has invented from time to time thru his studious career. A novel and original high frequency generator was another of the devices that greatly interested the writer. It employed a jet of water shunted by a large capacity, the stream of water being connected to a high potential source of direct current. High frequency currents

Top Photo Shows Antenna Wires Being Placed in River by Mr. Rogers' Assistants. The Inventor Has Found that His System Works Just as Well Under Water as Thru the Earth. All of the High Power Stations in the World, from Nauen and Lyons to Honolulu, Are Heard in Mr. Rogers' Laboratory at Hyattsville, Md., Shown in the Center and Lower Views Herewith. The Author of This Article Also Heard the Transatlantic Stations Coming in Loud and Clear. Mr. Rogers' Invention Is the Greatest in the War and Is so Recognized by the Government.

of any range up to the limit of audibility, or about 30,000 cycles per second, could be readily obtained with this apparatus. The writer merely cites these facts to substantiate the standing of Mr. Rogers in the scientific field. Hundreds of other electrical inventions have been made by this modest genius of the quiet little Maryland town of Hyattsville, and the principal outstanding fact of all of his work is that he can show you a working model of each of these inventions, unlike many other inventors whose ideas exist only on paper, and which often fall down, miserably, when actually built and tested.

In this connection it is interesting to consider for a moment that not one of the new wireless "static and interference preventers" proposed to the government radio experts during the war, proved practicable in the least.

www.americanradiohistory.com

Copyright, 1919, by E. P. Co.

The Rogers Undersea Wireless Opens Up an Entirely New Field to Submarines and Ship Communication. Marconi Recently Stated that Submarines Had to Come to the Surface to Intercept Radio Messages, but the Rogers Invention Has Upset All This. On a Recent Test a U.S. Subsea Boat Submerged Off the American Coast to a Depth of 8 Feet and Picked Up Nauen, the German Station. At Depths of 21 Feet Stations with Wave Lengths over 12,000 Meters Were Easily Picked Up. Transmission to Submarines Has Also Been Accomplisht.

Official recognition of Mr. Rogers as the one and only original inventor of "Under-ground and Sub-sea Wireless Communication," was soon forthcoming, and here it is in brief. These two official letters of recognition of Mr. Rogers' wonderful and revolutionizing invention represent but a very small fraction of those he has received from radio engineers of high repute in all parts of the world, congratulating him on his masterly work. The Navy Department has just permitted information on the Rogers system to be given out, and how well they kept their secret during the World War, during which time this system has been in use by the Navy Department, may be judged by the fact that radio men everywhere are amazed at this feat. The distinguished radio savant Prof. George W. Pierce of Harvard University, congratulated Mr. Rogers heartily when he first tested and heard the new system work thru salt water, which he at first thought absolutely impossible.

Hyattsville, Md.,
January 13, 1919.

Dr. Nikola Tesla,
New York City, N. Y.

Dear Dr. Tesla:—

I have just read with great interest your article in the Electrical Experimenter. For years I have been a firm believer in the theory that far distant aerials were actuated thru the medium of the Earth and not thru the ether above, and it is a source of great satisfaction that so illustrious a personage as yourself has held to the same belief. I have never met a scientist who would entertain such a proposition until I demonstrated to them results described in the enclosed paper, illustrating one of the ways I have found for utilizing the energy so clearly and forcibly described by you. I am, nevertheless, confronted by some who will not give up old theories. If you would do me the great honor of writing a few lines upon the scientific feature I would deem it a great favor.

Should you chance to be in Washington at any time I will be highly gratified to have you visit my laboratory and witness the results obtained.

Very sincerely,

(Signed) J. Harris Rogers.

Below we give the two letters of official recognition by the Navy Department of Mr. Rogers' accomplishments, which are all that we have space for.

In response to an inquiry from Clarence J. Owens, director general of the Southern Commercial Congress, Admiral Griffin, U. S. N., chief of the bureau of steam engineering, wrote under date of December 27, 1918, as follows:

"In reply to your question regarding the originator of the underground radio system, you are advised that Mr. J. H. Rogers of Hyattsville, Md., was the originator of this system. There have been other claimants to methods of underground radio signalling, but none were useful, within the Navy Department's knowledge to the extent of being a valuable asset to the general scheme of radio communications. The introduction of Mr. Rogers' receiving system marked the beginning of the use of underground aërials for receiving, to great advantage over raised aërials, and has been valuable to the Navy during the war."

Rear Admiral Strother Smith, then Capt. Smith, wrote Mr. Rogers on December 7, 1917:

"It is a great pleasure to me to feel that I have been instrumental in bringing the result of your work before the Navy Department and assisting somewhat in putting it into actual practise. Out of the many thousand ideas presented you can realize that a very, very small percentage are valuable and it is worth at least a year's work to get one that I feel will give lasting benefit to the service that I take pleasure in serving."

The Navy Department Interested.

Thru Dr. George H. Lamar and Senator Blair Lee the discovery and the status of the patents were brought to the attention of Secretary Daniels of the Navy. Secretary Daniels ordered inquiry into Mr. Rogers' claims, which showed that his invention worked, and requested Secretary Lane to give special consideration to pending patent applications.

Secretary Daniels then submitted the Rogers system to Rear Admiral (then Captain) Strother Smith, who called into consultation Capt. Hooper. These officers made a thoro study of the system and found it practicable. Capt. Hooper ordered it installed at New Orleans first and since then it has been employed at Belmar, N. J.,* and other stations.

* At the time of writing this article the Belmar Trans-Atlantic Receiving Station is still employing the Rogers underground antenna.

For a decade Mr. Rogers has been studying radio subjects, and long before the United States entered the war he had experimented with the problem of ridding aërial communication of this static atmospheric electricity. He disagreed with all authorities who believed that the air, and not the earth and water, was best suited for wireless communication.

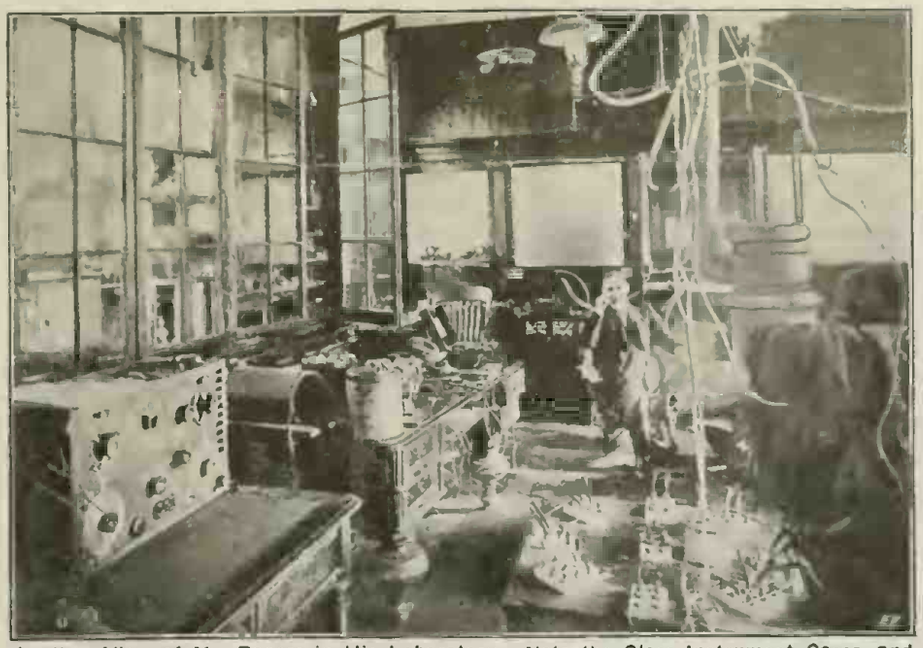
At first Mr. Rogers used the earth alone for sending messages to amateurs stationed near by. Using an audion bulb, he then buried a wire from his laboratory and heard Philadelphia and other stations. Further experiments were conducted at a laboratory

To the American Radio Amateur:

WITHIN the next few months peace will be declared and the amateur will be allowed to operate his station as before. Thanks to Mr. James H. Rogers, it will not, however, be necesary for you to put up an aerial again—at least not for receiving. Elevated aerials will be a thing of the past, and well they may.

But ordinarily the amateur would not be permitted to use the underground aerial system on account of Mr. Rogers' fundamental patents. The writer, however, in conversation with Mr. Rogers, prevailed upon him to allow amateurs the free use of his revolutionary, as well as epoch-making invention.

Mr. Rogers thru the ELECTRICAL EXPERIMENTER therefore wishes to announce that he personally has no objection if amateurs use his system privately. It should be understood that the inventor only gives this permission to amateurs as such, and that this permission, of course, does not extend to firms or corporations or to individuals engaged in commercial Radio work.



We wish to congratulate our readers upon this important decision of Mr. Rogers, who certainly deserves the everlasting gratitude of all American Radio Amateurs.

H. GERNSBACK.

www.americanradiohistory.com

near Bladensburg, which he calls "Mount Hooper," in honor of Commander Hooper of the Navy, who rendered excellent service in adapting the invention to the needs of the Navy Department.

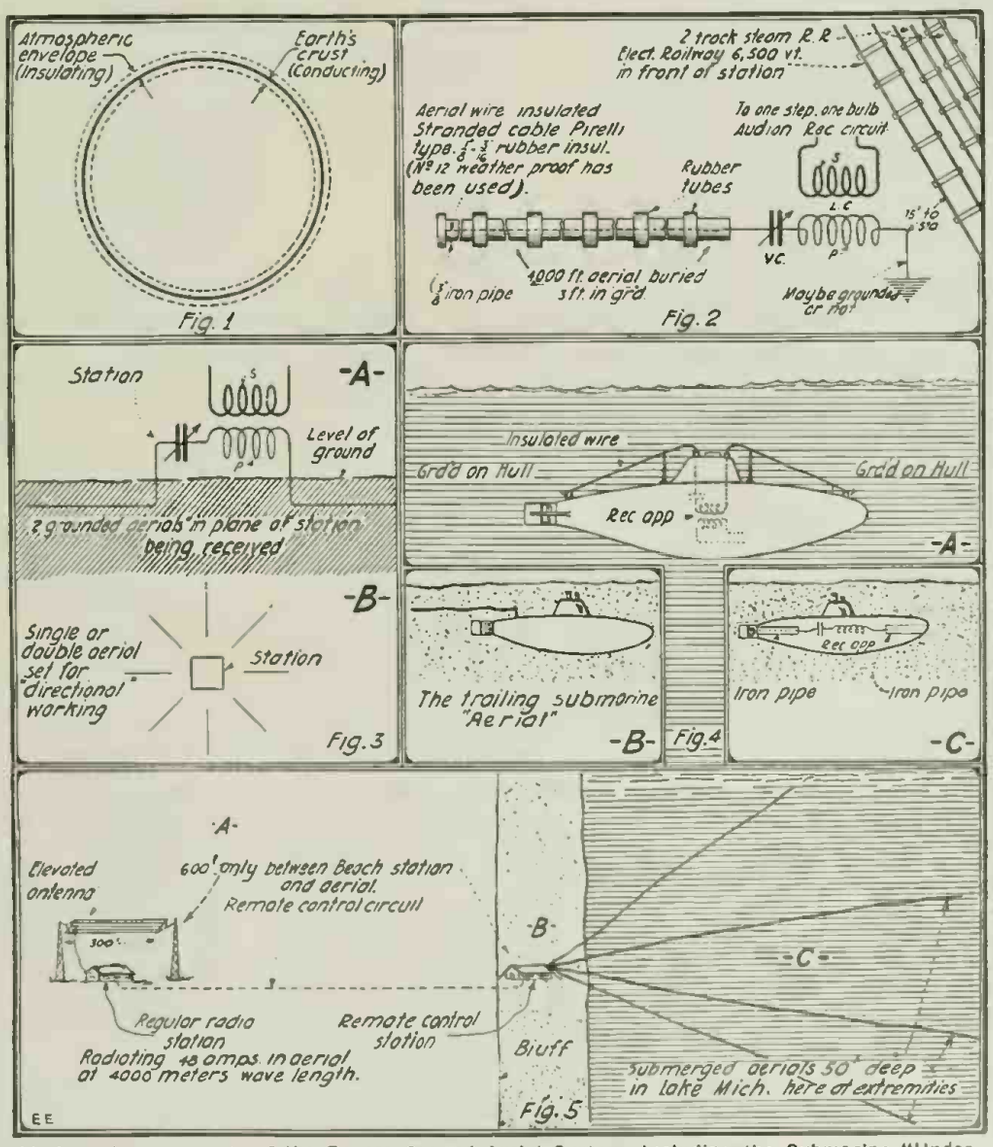
When Mr. Rogers first stated that messages could be received and sent from submarines when submerged it was unanimously declared to be impossible and the officials of the Bureau of Standards were not alone in this belief, as no less a personage than Marconi declared at a banquet given in his honor in Washington, that when wireless was used on submarines, "it was **necessary for the submarine to come to the top in order to catch the ether waves."**

Another View of Mr. Rogers in His Laboratory. Note the Glass Instrument Cases, and In the Background May Be Seen His Early Printing Telegraph Model.

To demonstrate more clearly the underground system and to show how it could be used in trench warfare, Mr. Rogers constructed an underground station, wholly inclosed beneath the surface of the earth, there being no visual existence of it outside. This place in Prince Georges county was visited by some very noted men, including Dr. Abraham, the head of the French Scientific Commission, who, upon entering the cave at Mount Hooper exprest his amazement and remarked, "the Germans can't get us here." Lieutenant Paternot, of the French Scientific Commission and the radio representative of France, also heard his native stations talking and exprest equal satisfaction, pleasure and amazement.

How He Conceived the Underground System.

The writer asked Mr. Rogers just how he came to form the idea of the "Underground and Subsea Radio." He explained that from his very first study of the method of transmitting radio signals by means of an elevated antenna, the question constantly presented itself to his mind—"If 50 units of power are past into the aërial, then what becomes of the equal amount of energy which passes into the ground?" He became so obscest with this conundrum that he finally asked several prominent radio savants this question. What do you suppose the answer was?—"It is dissipated in the form of heat in the ground," they answered. But still Mr. Rogers thought they were wrong and now he has proved it. Another early idea of his in the theoretical aspect of radio-communication was as follows, and very logical it was, too, as you will agree: He held that if the outer crust of the earth is a *conductor*, and the surrounding atmospheric envelope is an *insulator*, then how infinitely better must the former be for the transmission of any form of electric current.



To Mr. Rogers' mind it was more reasonable to suppose that the energy liberated at the base of an aërial was propagated thru the earth as well as thru the ether above, and that an elevated aërial, at great distance, would be actuated by them as effectually as if the waves reached the same point thru the ether above; when the waves thru the earth reached the base of the aërial the potential of the plate would be raised and lowered and the aërial would accordingly be energized. Thus was his basic and original idea conceived and settled upon.

Mr. Rogers' first trial with the underground wireless to nearby radio amateurs began about seven years ago, but his theory of the reason why it must work was formulated over ten years ago. Further, he conjectured that much less power would be required to propagate a wave or current thru the earth's conducting crust, which for one thing has smaller geometrical dimensions, than to propagate it thru the insulating atmospheric envelope alone. See Fig. 1.

The Theory of Operation.

A number of other radical ideas were entertained for several years by Mr. Rogers, and in the course of time he has found that his ideas were correct—it worked! it worked! And now the radio experts far and wide are holding a *post mortem* inquest on their theories and how it all happened. To start with, Mr. Rogers stated, "special credit is due the following gentlemen, who have re-

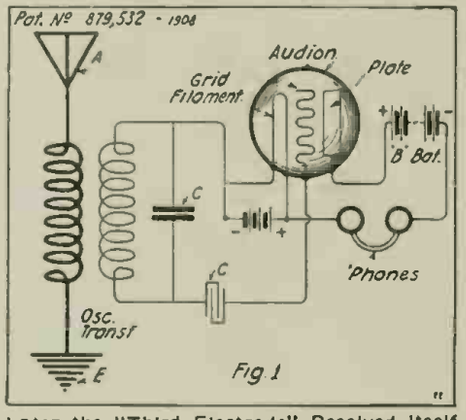
How I Invented the Audion

By Dr. LEE de FOREST

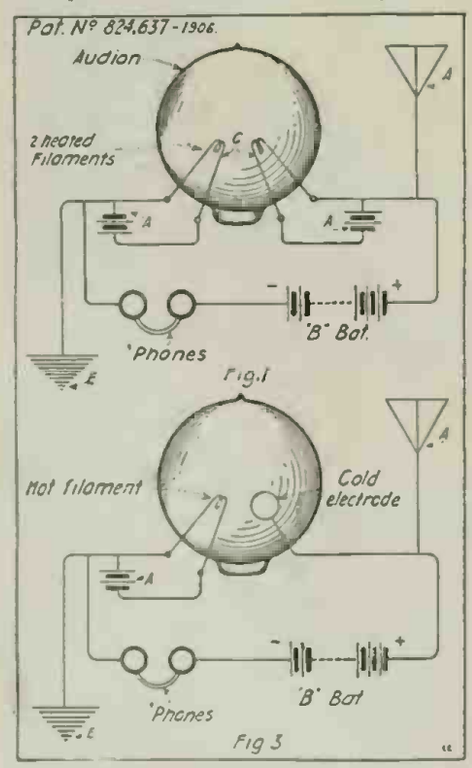
Written exclusively for the Electrical Experimenter



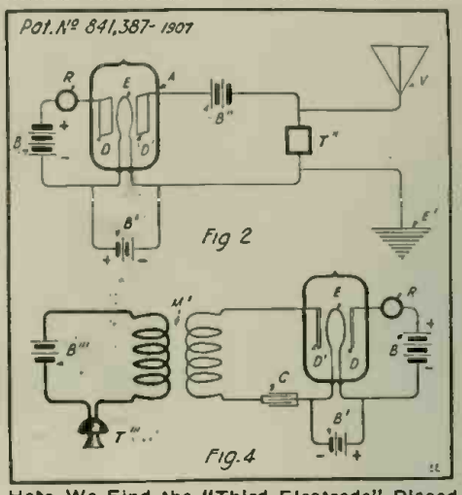
THE first conception of a detector of Hertzian waves which should employ the medium of heated electrodes or heated gas came to me as follows: In the summer of 1900 I was experimenting on a new type of electrolytic

The First State in the Development of the Audion by Dr. Lee de Forest. The Aerial and Ground Were Connected to Two Electrodes Placed in the Flame of a Bunsen Burner, with Successful Results.

detector, doing this work at night in my room in Chicago. The receiving apparatus was placed on a table beneath a Welsbach gas burner. A spark coil which I was using as my source of oscillations was located in a closet about ten feet distant. One night I noticed that whenever I closed the switch of the spark coil by means of a string running across the floor from my table to the coil, there was a decided change in the illumination from the Welsbach burner. The light from the gas mantel increased very perceptibly and resumed its normal low brilliance as soon as the sparking ceased. This phenomena continued and imprest itself strongly upon my attention. My first thought was that I had discovered a new form of detector of Hertzian waves, of extraordinary sensitiveness, and was, naturally, much enthused, as any young investigator would have been under similar circumstances. But upon closer investigation of this novel phenomena I found that when the door of the closet was closed, or almost closed, the effect of the spark upon the gas burner ceased! This proved conclusively that I was dealing with sound waves coming upon a sensitive flame and not with electrical waves.



The delusion lasted, however, long enough to force upon my mind the conviction that heated gas molecules were sensitive to high frequency electrical operations, and I determined to investigate further at my first opportunity and actually discover evidence to substantiate my theory. I was unable to do this until the fall of 1902 or '03 when I returned to my gas mantel experiment. I first attempted to investigate the new detector phenomena by using two needles of steel, or platinum, placed close together in the incandescent Welsbach mantel. These

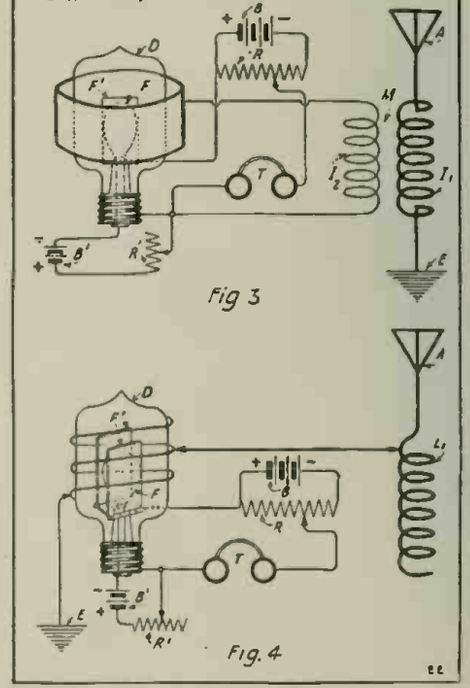


Later the "Third Electrode" Resolved Itself into a Grid, Which Was Placed Between the Wing and Filament, Where It Could Act with the Highest Efficiency. In This Form It Has remained Practically the Same to the Present Time.

two needles were connected to a dry battery and telephone receiver. I was, however, unable to obtain any appreciable current between the two electrodes in the mantel. I then investigated the flame of a Bunsen burner and soon found a point in the outside envelope of the flame where an appreciable current did pass between the two electrodes, making a soft fluttering sound in the telephone receiver. (See Fig. 1, Patent No. 824,638, issued in 1906.) Then, connecting one electrode to an antenna and the other to the earth, I heard for the *first* time signals in the telephone receiver; signals which represented clearly the sound of the transmitting spark. Here at last was actually demonstrated my earnest belief in the existence of this new detector principle. My next step was to enrich the gas flame by putting a lump of potassium or sodium salt in the flame directly below the two platinum electrodes. This increased ionization caused increased flow of battery current, and a corresponding increase in sensitiveness of the new detector. I did considerable work then with various types of Bunsen burner arrangements for permanently enriching the gas flame, etc., and set up a laboratory type of flame detector which was actually used in 1903 for receiving signals from ships down the Harbor of New York.

The inconvenience of supplying a source of gas for the new detector was, of course, obvious, and I sought for other means of obtaining the necessary heated gas and heated electrodes. The electric arc first

Here the Placing of the Two Heated Electrodes in a Vacuum Bulb Is Carried Out, as Well as the Final Adoption of the Cold "Wing." This Device Works Equally Well with Both Electrodes Hot, Thus Disproving Any "Rectification" Theory.



Here We Find the "Third Electrode" Placed Inside the Bulb, Where It Logically Belonged, as Dr. de Forest Points Out. Fig. 4 Shows the First Use of the "Stopping" Condenser.

suggested itself. I anticipated that while this arc would be a detector, it would be exceedingly irregular and noisy in the telephone receiver. This was found to be the fact. The battery fed the arc thru the primary of the transformer, in the secondary of which was connected the telephone receiver, and, altho at times the looked for response to electric waves was thus obtained, the noise in the telephone receiver from the arc was so deafening that the idea was abandoned.

The next plan which suggested itself to me was to use incandescent filaments in an enclosed chamber. This arrangement as well as the gas detector, was illustrated in my patent No. 979,275, which bears the first date of November 4, 1904. This patent ap-

Gigantic 1,400 K.W. Radio Station at Lyons, France

ONE of the most powerful wireless stations yet designed is that now nearing completion at Lyons, France, and we are indebted for the following description of this remarkable and extremely high power radio station, representing the very latest advances in radio engineering, to Dr. Lee de Forest, the well-known American radio engineer and scientist who has recently returned from a trip thru Europe. Dr. de Forest stated that apparently no expense was being spared in the design and construction of this now famous Lyons station, and that the engineers were apparently having everything *carte blanche*, for there seems to be no limit to the apparatus installed, and in contemplation for installment at this powerful station.

A glance at the map shows that Lyons lies southeast of Paris, and about half way between Paris and Marseilles. This station has been, and is at the present time, handling all of the official Government radio traffic to the United States, communicating principally with the powerful new naval radio station at Annapolis near Washington, D. C. The Lyons station is in daily communication, and has been in connection with various parts of the Continent, as well as Africa, different countries of Asia, and many other far-flung places in all parts of the globe.

A Plan View of the Powerful New Radio Station Located at Lyons, France. There Are Six Different and Distinct Forms of Transmitters Installed in Duplicate as Shown. The "Receiving Rooms" Are in a Wing of the Building, Not Shown Here, Running Eastward from the Point Where the 150 K. W. Spark Sets Are Situated. This Wing Includes a Laboratory, Tape Punching Room, Quarters for the Personnel and Administration Office.

At first this may sound somewhat exaggerated, but when the great capacity of this radio station and the extremely efficient apparatus used is considered, it will seem all the more reasonable and possible. To begin with, the Lyons station has a very large aërial, comprising twenty strands of phosphor-bronze cable stretching away over a distance of 2,400 feet and supported on eight steel masts, each of which rises to a height of 650 feet. The masts are placed about 800 feet apart. It is interesting to note in this connection, as Dr. de Forest pointed out, that the engineers responsible for the design of this station have found that contrary to the generally accepted idea concerning the directive effect of inverted "L" aërials of this type, that where great distances and long waves are concerned, the comparative efficiency of transmission in any certain direction about the antenna does not differ appreciably. The general direction of the present antenna is north and south, as the arrow shown in the plan view of the station indicates, the free end of the huge antenna pointing toward the south.

The aërial conductors at the station end are fan-tailed together as shown and a large twisted cable forming the lead-in, leads down thru a cupola on top of the building, underneath which there is a large and very elaborate circular antenna switch from which lead separate connecting aërial wires to the various transmitting apparatus, several distinct types of which are installed in this station.

The lay-out of the station buildings has been well planned, and the larger building, containing all of the long distance radio transmitting equipment, is in the form of a cross. West of the large building there are two small structures, a small one containing a 3-K.W. high-frequency generator of the Bethenod (French) type, having a speed of 6,000 r.p.m. operating at an antenna frequency of 80,000 cycles. The building next to this houses a 150-K.W. arc generator of the Elwell type, and this transmitting set has an antenna lead running to the central aërial switch in the main station building. This particular set is of great interest to Americans, as it is the one which has been used in transmitting all of the official Government messages to the United States. It has been operated right along with a United States naval radio crew, and has been very busy night and day. The powerful arc-oscillation generator has been in use continuously, and has often been run *twenty-four hours at a stretch*, only shutting down the arc periodically for renewing the electrodes.

The following description of the main station transmitting equipment, which is being installed in duplicate, is given in the order of its installation, the first apparatus described being the older.

In the long northerly wing of the station of the main building there are installed two 150-K.W. spark sets. These are somewhat similar in design to the well-known Fessenden spark transmitter at Arlington near Washington, D. C., and those who are familiar with that station and the huge condenser and tuning transformer dimensions and equipment there used, will have some idea of what this apparatus looks like. The high tension leads from the step-up transformers, pass thru large plate-glass partitions to the condenser and oscillation transformer room. The condensers are placed in banks and provided with necessary switches, busbars, etc., for connecting them up in series, parallel or in series-parallel, as may be necessary. The oscillation transformers are very interesting as they are huge affairs, each spiral being composed of many turns of heavy copper strip, the dimensions of the strip being 8 *inches wide by ¼ inch thick*. The convolutions of the helix in each case are well supported and installed on large porcelain insulators, and one of the coils on each transformer unit is made movable for adjusting the coupling, or distance between primary and secondary, in the manner here illustrated. As will be seen, the movable primary coil is placed on a small truck mounted on four wheels, which rest on a pair of insulated tracks. The coupling is changed whenever desired, by simply pulling on one or the other of two ropes attached to the carriage in the manner indicated. When a change in inductance is to be made in one of these oscillation transformer windings, it is accomplished by changing the position of one of the lead cables connected to the spirals, the end of the cable being fitted with massive clamps, which may be fastened at any point desired on the spiral.

The eastern wing of the main station will shortly contain two radio frequency alternators, as the plan view shows, one of these being of the General Electric-Alexanderson design, rated at 150 K.W., and the other set being of the Bethenod (French) design, rated at 150 K.W. also. These sets are tuned and adjusted to operate at an antenna frequency of 20,000 cycles. By means of the cleverly arranged antenna switch-gear, either of these sets can be connected up to the antenna. Also, when necessary, two such sets may be connected in parallel to the antenna for extra long range

Experiments With Ultra-Violet Light

By J. C. MORRIS, Jr.

ALTHO the majority of experimenters are interested in the subject of X-Rays, little attention has been given to the study of the *ultra-violet rays*. These rays have been extensively studied by Finsen and other investigators and were found to have a wave length of about .0002 mm. This is far too short a wave to be seen by the human eye, but their production is usually accompanied by manifestations of visible light.

Some of the Most Interesting Experiments in All Science Can Be Conducted with Ultra-violet Light. The Simple Apparatus Required for Producing These Rays in Quantity Is Illustrated and Described Herewith. Ultra-violet Rays Will Solve Some of the Great Problems of the Future.

All of the apparatus required to produce these rays is extremely simple and is to be found in nearly every experimenter's workshop. Fig. 1 shows how the apparatus is connected: C. is an induction coil giving a spark 1 inch or more in length; L, is a Leyden jar or other form of high voltage condenser; H, is a coil consisting of 10 or more turns of heavy wire (a good wireless helix will do very well) and G, is the generator of the *ultra-violet rays*. It consists of a spark gap whose terminals are composed of iron or steel nails. A convenient form of generator may be made out of a short length of card-board tubing, thru which the nails are driven. A gap of ⅛ inch must be left between the nails. A small opening must be cut in the tube for the rays to pass thru. A quartz (not glass) window may be placed in the opening, if desired. See photograph. A small spark gap may be placed at X, if desired.

The following are some simple experiments with the *ultra-violet rays*.

Experiment No. 1:—Secure if possible a piece of willemite (which is a natural silicat of zinc). When the willemite is exposed to the ultra-violet rays it will fluoresce with a pale greenish color. This is a test for these rays.

Several other substances besides willemite will fluoresce when exposed to these rays, among these are sodium silicat, fluorescin, aesculin, sulfate of quinin, also platino—barium-cyanid screens, such as are used for X-Ray purposes.

Experiment No. 2:—One of the most peculiar properties of the ultra-violet rays is their ability to ionize air; that is, to make air a partial conductor of electricity. The following three experiments demonstrate this property of these rays.

Make two disks of metal about 5 inches in diameter. Place one of these on top of an electroscope. Suspend the other about ½ inch above the electroscope. Now charge the electroscope with either positive or negative electricity. Focus the ultra-violet rays between the plates. The electroscope will soon be discharged, due to the ionizing (rendering conductive) effects of these rays.

Experiment No. 3:—Start a small induction coil and separate the secondary terminals just beyond the sparking distance. Focus the ultra-violet rays on the spark gap. The spark will now jump the gap, due to the ionizing effects of these rays.

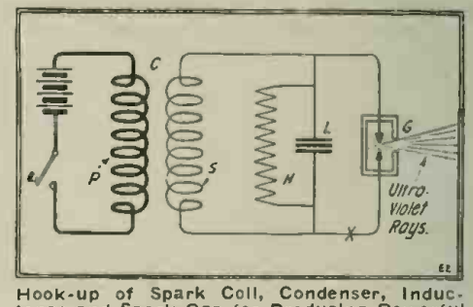
Experiment No. 4:—Take two small metal sheets and separate them a short distance apart. Connect these plates in series with a powerful high voltage battery and a very sensitive galvanometer or telephone receiver. No current now flows, due to the resistance of the air gap. Focus the rays between the plates and a minute current will now flow, due to the ionizing effects of these rays.

Experiment No. 5:—Start the generator of the ultra-violet rays. Place a piece of glass in front of the opening and examine a piece of willemite. It does not fluoresce. Substitute a piece of quartz or of ice in the place of the glass. The piece of willemite will now fluoresce. This experiment shows that *glass is opaque to these rays*, while quartz and ice are transparent to them.

Experiment No. 6:—There are certain substances which are able to transform the short ultra-violet rays into visible rays of light. A Geissler tube is a generator of these rays and may be used to show the fluorescence of certain substances. Make a fairly dilute solution of sulfate of quinin, and add a few drops of sulfuric acid. Partially immerse a Geissler tube into the solution and connect with an induction coil or preferably to the positive pole of a static machine. While the tube is being operated the solution will appear to be light blue in color.

Other substances besides quinin will fluoresce. Some of these are aesculin (from horse chestnut bark), fluorescin, and hydroquinon, such as used in photography.

These are only a few of the many interesting experiments which can be performed with these rays. The photograph is a picture of the author's apparatus for generating these rays. The study of the ultra-violet rays is exceedingly interesting and will amply repay the time spent in making the apparatus. It represents an uncommon field for experiment and one that holds much promise for the future of science.



WORKSHOP ACCIDENTS.

It is well to know what steps should be taken in the case of the minor accidents that may happen to handicraftsmen and experimenters in the prosecution of their hobbies. These are mostly in the nature of cuts, scalds, and bruises. It is a good plan to keep a lump of alum handy to stop the bleeding in the case of small cuts. Toilet alum, sold by druggists, is the best, and is frequently used by those who shave themselves.

A simple clean-cut wound should be cleansed in cold water under the tap, which generally stops the bleeding at the same time, after which the sides should be brought together carefully and supported by strips of sticking plaster held in position by a bandage.

Wounds inflicted by rusty nails and other pieces of metal often lead to serious inflammation or blood-poisoning. These ill effects may be prevented by the following very simple remedy. Place a little brown sugar on a fire shovel and heat until it smokes, holding the wound in fumes for several minutes. A few scraps of clean woolen rag will answer the same purpose, but sugar is best. Peroxid of hydrogen and iodin tincture are reliable solutions for treating wounds which involve abrasions.

Some boracic ointment should always be kept available in case of burns and scalds resulting in a raw surface, or a strong solution of washing soda may be used. Severe burns, and in particular those caused by splashes of molten metal, are best treated with raw linseed oil poured over the burn and covered with a pad of lint.

Hook-up of Spark Coil, Condenser, Inductance and Spark Gap for Producing Powerful Ultra-violet Rays.—Fig. 1.

Small splinters of steel or wood are often run into the flesh and cannot be removed with the fingers alone. In the absence of a pair of fine pointed tweezers an ordinary sewing needle may be employed. Heat the end of the needle, or dip it in peroxid of hydrogen, iodin, or carbolic acid and water, to kill any germs on it before touching open cut. Slip the eye of the needle over the protruding end of the splinter, give it a twist to make it grip, and then raise the needle when the splinter will come out as well in most cases.

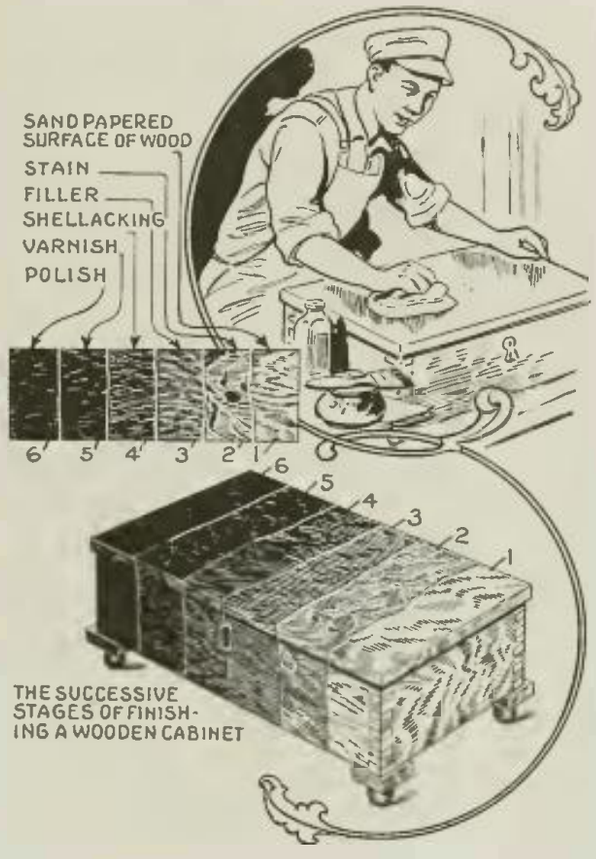
Wood Finishing for the Amateur

By ARNO A. KLUGE

WHEN the experimenter is constructing a piece of apparatus, whether it be an instrument cabinet or one of Tom Reed's famous clocks, he is confronted with the problem of finishing the woodwork on it, if such there be. We often find that this last process is neglected to a degree where it is a detriment to the appearance of the instrument, and as "looks is everything" to the uninitiated, we should give the matter a little more time and study.

There are a number of general processes used in finishing a piece of wood, namely: Sandpapering, Staining, Filling, Shellacking, Varnishing, Rubbing, and Polishing, in the order in which they occur. Each of these will be treated separately, also any subdivisions which may come under them; but we should bear in mind that it is not always necessary to use all of them, and so the finisher should know the exact processes he is going to use before starting any piece of work. Also, all of the material required should be at hand, so that the work may proceed expeditiously and without waste of time.



The first operation, that of sandpapering is to give the wood an absolutely smooth surface and prepare it for the filling. It is assumed, of course, that the wood has already been planed reasonably smooth, so that No. 0 sandpaper is about right for the job. A sandpaper block about four inches square and one inch thick should be prepared, taking care that one of the four-inch surfaces is perfectly flat, with no high corners. The piece of sandpaper is placed underneath the block, the surplus sides turned up, and the sandpapering done ACROSS the grain. Never sandpaper with the grain, as this produces tiny grooves on the surface, especially with soft woods.

One other precaution should be noted. Be careful when sandpapering close to the edges, they will be rounded off if you bear down too hard. If desired, a piece of scrap wood whose surface is flush with the work may be laid up against the edge, so that the sandpaper will pass over to this piece when it reaches the edge of the work. After these operations are completed, dusting off is in order, and it should be done thoroly, to remove every particle of dirt from the surface.

We are next ready for staining the wood, if we desire to change its color in any way. Remember, however, that staining is only resorted to when we do not wish to finish it in its natural state, but have decided either to emphasize its own color, or give it another in imitation of some other wood. Most hard woods are more beautiful in their own color than they are in a false dress.

There are two kinds of stains in common use, and both have their faults and good points. These are: Oil stains, in which the pigments are reduced to a workable consistency by the use of turpentine, naphtha, etc.; and water stains, which, as indicated by the name, use water in preparation, and hence must use water-soluble pigments. The main advantage of the oil stains is that they do not raise the grain of the wood, and do not show the laps of the brush strokes upon soft, open grained woods such as white pine, poplar, etc. Upon hard woods, however, they do not penetrate deep enough to be desirable, and water stains are commonly used for such.

Water stains are very penetrating, and if properly made will bring out the grain of the wood very beautifully, instead of clouding it as most oil stains do. Their chief fault lies in the fact that they raise the grain, involving additional sandpapering to obtain a level surface, but this is offset by the additional beauty of the finished product.

This Illustration Shows Clearly the Successive Stages to Be Carried Out in Polishing a Wooden Cabinet. It Must Be Thoroly Sandpapered or Else the Much Desired High Polish Will Be Hard to Attain.

In addition to the two classes of stains just mentioned there are the aniline stains which have practically supplanted all the others. When buying colors for the aniline stains, it is necessary to name the color, as aniline black, aniline red, or whatever it may be. Some good formulas for each class of stains are given herewith, these having been compiled by a cabinet maker of many years' experience, and their accuracy can be vouched for. Ready-made stains can be bought almost as cheaply, however, and if time is an asset, these are advisable.

Mahogany. Boil logwood chips in a closed vessel with twice their bulk of water for several hours; strain, and add a small quantity of chlorid of tin to give it redness. Two coats are necessary

Walnut Permanganat of Potash.....1 ounce
Epsom Salt .....1 ounce
Water .....1 quart

Dissolve, strain, and apply several coats.

Cherry. Reduce the mahogany stain for cherry.

Oak. Asphaltum Gum.....¼ pound
Turpentine .....1 pint

Ebony. Dissolve extract of logwood in wood alcohol to the strength desired, strain, and apply. Develop the color by going over the work with a solution of muriat of iron, made by mixing equal parts of it and alcohol.

Yellow. Turmeric Powder .....1 ounce
Alcohol .....1 pint

Allow this to stand several days, shaking it often. Strain for use, applying several coats.

Aniline Mahogany. Bismark brown.....1 ounce
Water .....3 quarts

The above formula is typical of all aniline stains.

Antique Oak. Dissolve asphaltum in naphtha, making a very thin mixture; the filler used should be the antique filler.

The third step is filling the wood, if staining has been necessary, and by this we endeavor to level up the surface, and get a mirror-like smoothness. It is best to purchase fillers ready-made, as it is difficult to get the proper consistency. They consist of very fine silex stone, in a mixture of half linseed oil and half turpentine, with the proper coloring matter added. After the filler has been applied, and its color begins to change to a dull flat appearance, it is time to rub it off, using a piece of flax or hemp tow for the purpose, and rubbing until the surface is quite smooth. the work should not be allowed to dry thoroly.

After filling, shellacking is resorted to with hardwoods, in order to close up the pores completely, and prevent the sinking in of the varnish, which would otherwise leave tiny pinholes on the varnished surface. Pure grain alcohol shellac, either the orange or the white, should be used, mixed in the following proportions:

Shellac .....½ pound
Grain or wood alcohol..... 1 pint

After allowing the shellac to dry for six or eight hours, sandpaper with No. 00 sandpaper, being careful of the corners, and also to use but little pressure, so as not to cut thru the coat of shellac. With new sandpaper it is best to rub two pieces together several times to remove the danger of scratching.

When applying varnishes a brush suited to the size of the work should be used, and the operation should be performed in a room temperature of at least 70°, to insure free flowing. Altho it is impossible to tell just how to varnish successfully, practise being the only way to learn, a few simple rules may be given. Apply the varnish with the flat of the brush, along the grain; then rub it out crossways to get an even application; finally finish it off with the grain. Care should be taken not to skimp on varnish, and yet at the same time not to put too much on. This is another matter where practise is the only real teacher.

After one coat of varnish has been applied and is thoroly dry, the surface is rubbed smooth, using ground pumice stone and a pad of rubbing felt. The finer grades of pumice stone, as F and FF, are the best, as there is less danger of scratching thru the varnish. One should always rub with the grain and not bear down too hard at the beginning or end of the strokes. Some linseed oil should be at hand as rubbing oil, the felt being dipt into the oil and then into the pumice stone, a quantity of the latter thus adhering to the felt. Cleaning off should be done at once, using soft cotton waste for this purpose. Woods having coarse fibers should not be rubbed until two or more coats of varnish have been applied, waiting each time until the previous coat is dry. This is necessary or the fibers will come up above the surface, thru the varnish.

Having rubbed the surface perfectly smooth we may now give it a high polish, or we may leave it with a "dead" finish. If polishing is elected we may proceed in

Experimental Chemistry

By ALBERT W. WILSDON

Thirty-Fourth Lesson

SILICON

SILICON is the central element in the mineral world, like carbon is in the animal and vegetable kingdom. Unlike carbon, silicon never occurs in the free state. Next to oxygen, it is the most abundant element. Oxygen is estimated to make up nearly half of the solid crust of the earth, and silicon to constitute about a third more. Its occurrence is chiefly

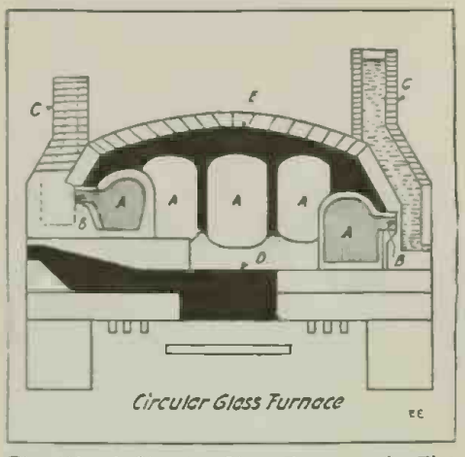

Fig. 160. A Circular Glass Furnace: A—Fire Clay Pots. B—Openings for Introducing Blowpipe. C—Chimney. D—Source of Heat. E—Roof, from Which Heat Is Reflected Downward.

in combination with oxygen in quartz and silicon dioxid (SiO_2). This non-metallic oxid is often further united with some metallic oxid, such as aluminum oxid (Al_2O_3) to form a silicate. It is, further, the chief constituent of nearly all rocks, and consequently, also of the soils which have resulted from the decomposition of rocks. It is also found in ashes of many plants, having assisted to make up their mineral structure. Despite the fact that this element is so widely distributed, the element itself has been, until recently, separated from its compounds only with such great difficulty that it was only a curiosity. By the present methods of reduction it is no longer difficult.

History.

Amorphous silicon was first separated and isolated in 1810 by Berzelius in an impure form. Later, in 1823, he obtained the pure element, by fusing together iron, carbon, and silica (Silicon Dioxid SiO_2). Deville prepared the crystalline variety in 1854. Phipson in 1864 first reduced it by magnesium.

Occurrence.

As previously stated, the element does not occur in the free state. Its affinity for oxygen is so great at a high temperature that in early ages, when the earth was a molten mass, the silicon all combined with oxygen to form silicon dioxid (Silica SiO_2), this later uniting with metallic oxides to form silicates.

Preparation.

Amorphous Silicon is best prepared by mixing equal parts of powdered and well-dried white sand (SiO_2) and magnesium. This mixture is placed in a test tube and heated with a Bunsen flame. The reaction soon begins with a glowing which rapidly extends thruout the entire mixture.

$$Si\ O_2 + 2\ Mg = Si + 2\ Mg\ O$$

The cooled, hardened product is powdered and then washed with dilute Hydrochloric Acid to remove the magnesium oxid. The product thus obtained is an amorphous, brown powder, which, when heated in air ignites and burns with the formation of the dioxid SiO_2.

Silicon is insoluble in water and acids, except hydrofluoric, which dissolves it readily.

The crystalline variety is prepared by fusing sodium silico-fluorid with aluminum, or zinc and sodium:

$$Na_2\ Si\ F_6 + 4\ Na = 4\ Na\ F + Si$$

The liberated silicon dissolves in the fused metal and on cooling crystallizes. The crystals are separated from the mass by treating successively with hydrochloric, boiling nitric, and hydrofluoric acids. Crystallized silicon is also prepared in an electric resistance furnace from pure silica sand and finely pulverized foundry coke.

$$Si\ O_2 + 2\ C = Si + 2\ CO$$

Properties.

The silicon of the silico-fluoric process is in the form of dark, octahedral crystals, possessing a degree of hardness, sufficient to scratch glass. They withstand white heat without igniting and resist the action of all acids except a mixture of hydrofluoric and nitric, which, when hot, dissolves them slowly.

The silicon product of the electric furnace is in the form of crystalline masses of a dark silver lustre. It is quite brittle and melts at 1420°C.

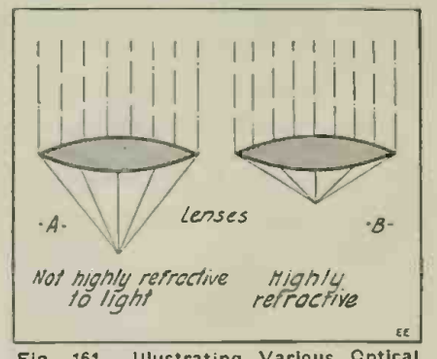

Fig. 161. Illustrating Various Optical Properties of Glass.

Glass.

What a common substance! Among the many necessities of daily life, few manufactured articles are more important than glass. The importance of this substance will be brought home forcibly when we only mention that without it the sciences of Chemistry and Physics and all branches utilizing the microscope and telescope (see Fig. 161) would probably never have been advanced to their present elevation. Bacteriology and its allied studies would have been unexplored, and as a result the lives of many who have been cured by microscopic examinations and subsequent proper treatment would have been sacrificed. Aside from the fact that it is an everyday necessity, being employed among other equally important uses, as a container for the milk which is delivered in the morning, the glasses used for drinking purposes; in rural districts as chimneys for lamps; and in large cities and dwellings for electric lamp and gas lighting. It would tax the reader too much to even for a moment try to imagine what kind of an existence we would have without our glass windows. It would mean that we would have no use for clocks, as our time would be controlled solely by the sun and moon. Imagine if you can such a superstructure as the Woolworth Building, as well as many others, practically a city in itself without windows. It is true that there may have been substitutes, but it is hard to conceive of anything which would compare with glass.

What is this substance which we could hardly do without? Generally speaking, it is an amorphous mixture of the silicates of calcium or lead with those of an alkali (Potassium or Sodium), obtained by fusing sand (Silicon Dioxid), lime or lead oxid with sodium or potassium carbonat. The cheaper grade of glass contains instead of the alkali carbonats a mixture of either one of the sulfates and coal dust. Thus the sulfates are reduced to sulfids, which form silicates with the sand. Upon the composition depends the degree of fusibility, hardness and refractive powers of the glass. Thus we must distinguish between the varied kinds.

Lime (Plate) Glass: This grade is much cheaper, harder and *less* fusible than "lead" glass. It is either a soda or potash-lime glass. The *soda-lime* glass, which is readily fusible, is the commoner sort, such as is used where cheapness is desirable, such as is used for window glass, plate glass, bottles, etc. The *potash-glass*, also known as Bohemian and Crown glass, is a silicate of lime and potassium. This kind fuses only at a high temperature, and is harder, and withstands the action of water and acids better than soda-glass. For this reason it is used extensively for the manufacture of chemical glassware, which must withstand fairly high temperatures without fusing. Potash glass is used for Leyden jars.

Lead (Flint or Crystal) Glass: Litharge (PbO) or red lead replaces the calcium oxid of lime glass. This kind is used for cut-ware, optical glass, such as lenses and prisms, being heavy, possessing great luster and brilliancy.

Replacement of a portion of the lead oxid by thallium oxid or boron tri-oxid, causes the refractive property of the glass to be increased considerably. The boron glass is called *"strass"* and finds use in the manufacture of imitation gems.

The varied colors of glass are obtained by the addition of various metallic oxids or salts. *Blue* glass is made with cobaltic oxid or cupric oxid; *Violet* glass, by using manganese dioxid; *Red* by metallic copper

This department will award the following monthly prizes: First Prize, $3.00; Second Prize, $2.00; Third Prize, $1.00.
The purpose of this department is to stimulate experimenters towards accomplishing new things with old apparatus or old material, and for the most useful, practical and original idea submitted to the Editors of this department, a monthly series of prizes will be awarded. For the best idea submitted a prize of $3.00 is awarded; for the second best idea a $2.00 prize, and for the third best prize of $1.00. The article need not be very elaborate, and rough sketches are sufficient. We will make the mechanical drawings. Use only one side of sheet. Make sketches on separate sheets.

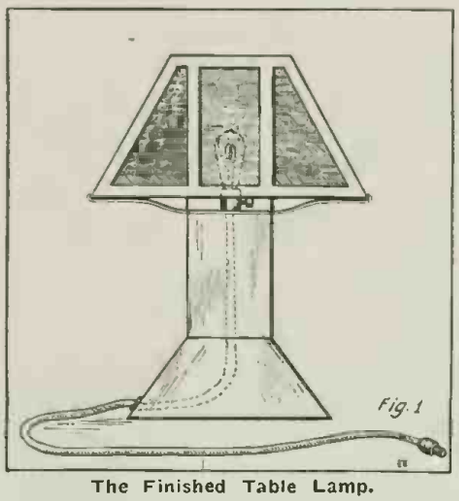
SECOND PRIZE, $2.00

SIMPLE RECTIFIER MADE FROM POLARIZED RINGER.

The materials required are: a low-resistance polarized telephone bell, two pair of binding posts, preferably rubber-covered, about 3" of ¼" x 1/16" brass or copper strip, and a plain wooden base, 4" x 3", and two silver dimes.

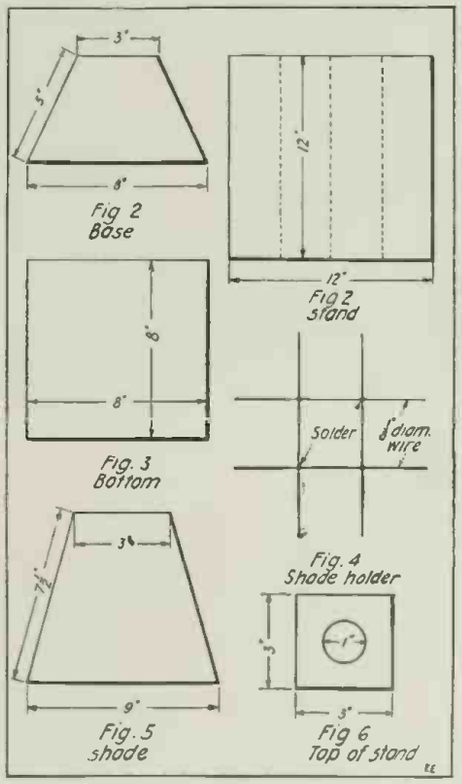
Remove the gongs from the bell and mount it on the base by means of two oblong blocks of wood, to the ends of which are screwed the attachment lugs on the bell; the blocks in turn being screwed to the base. Bend up 1" of each brass strip. To the upper portion solder half of a dime, previously filed to a smooth surface. Solder the other two halves of the dimes onto opposite sides of the hammer; see sketch for arrangement of parts. These two strips must be held down to the base by a pair of small screws. The two pairs of binding posts should be placed at opposite ends of the base. Connect as in wiring diagram.

Simple Rectifier Constructed From Polarized Ringer.



This rectifier will only handle currents from 1 to 9 amperes without dangerously overheating and operates best on 25 cycle frequency. Connect the terminals leading from the coils directly to the 110 volt A. C. current; direct current at about 50 volts D. C. will be obtained at the other terminals, due to auto-transformer action and drop due to resistance of contacts. Lubricate the armature pivots.

Contributed by GEORGE LUNGE.



FIRST PRIZE, $3.00

HOW TO MAKE A TABLE LAMP FROM SHEET METAL.

Cut four pieces of sheet iron, brass or copper, as per Fig. 1, solder together and then cut one piece as in Fig. 3, and fasten to this. Then cut one piece like figure 2, and bend as on dotted lines, making a stand three inches square and twelve inches high. Put this thru the opening in the completed base until it strikes bottom, then solder securely; cut a hole for the cord about one inch from the top of the base. Next cut one piece (Fig. 6) for socket and solder socket base securely to this, then wire up, putting wire thru base and soldering top on. For the shade holder cut four pieces of ⅛" iron or brass wire and solder as in Fig. 4. For the shade cut four

The Finished Table Lamp.

It is a Simple Job to Cut Out the Parts for Making the Table Lamp Here Shown. Copper or Brass Gives a Fine Finish.

pieces (Fig. 5) and solder; then fasten to holder. You can glue a piece of felt on the bottom of lamp. A ten-cent can of Mission Green enamel will make an attractive color for the lamp, if it is to be used in the den.

The shade may be made quite artistic at small expense by cutting out the side of the shade in some such pattern as shown. These are backed up by pieces of ground glass cut after the pattern of Fig. 5, or figured glass may be purchased reasonably at any fixture shop. If made of brass the lamp may be polished and lacquered or given an oxidized copper finish. Such a lamp will prove very useful in the camp and bungalow.

THIRD PRIZE, $1.00

HOW TO MAKE A COMBINATION VOLT AND AMMETER.

A combination meter can be made from a burned out or otherwise damaged winding of a volt or ammeter of the permanent-magnet pocket type.

Remove the old winding and rewind with No. 26 silk covered or enameled magnet wire, fastening the negative end to the shell or negative terminal, and the other end to the positive terminal. This is the

Details are Here Given for Building a Combination Volt-Ammeter From a Pocket Style Volt Meter or Battery Gage.

weak current reading, such as for old cells, coils, etc.

The volt reading is obtained by connecting a resistance (R) of varied size at J, and terminal V, which is tested by a dry cell reading approximately 1½ volts.

The amperes are now read by connecting a piece of No. 22 or 24 copper wire (A.W.) in shunt with the coil at J and a suitable switch, SW, to the case. The proper length may be found by testing with a cell of known amperage.

Wrinkles, Recipes Formulas

EDITED BY S. GERNSBACK

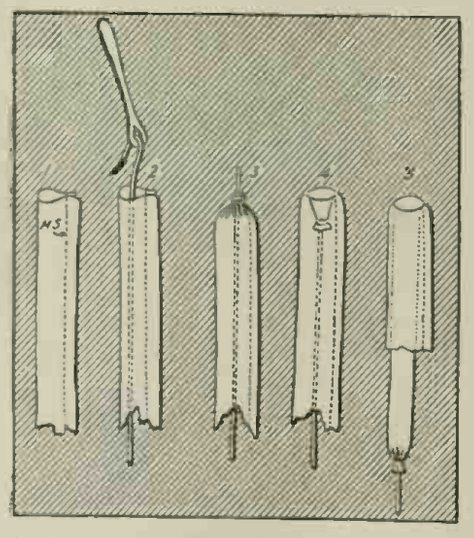
HOME-MADE PERISCOPE FOR READING TEMPERATURES AND OIL GAUGES.

The submarine commander has found the periscope invaluable for readily locating en-

A Peacetime Periscope to Make Reading of Scales Easy in Inaccessible Places.

emy vessels and obtaining his bearings under war-time conditions, and any electrician or engine room attendant, who has once used one of these home-made periscopes for reading meters, oil gauges or thermometers in inaccessible places, will never be without one. To make one of these periscopes, procure a piece of round or square metal tubing about two inches across. The tube may be of any length desired. Two small mirrors of suitable size are procured at a ten-cent store, and these are placed at an angle of 45 degrees, one at the bottom of the tube and the other at the top of the tube, in the manner shown. The image of the scale is reflected in the top mirror, thence down the tube onto the face of the lower mirror, and then out thru the opening in the tube to the eye. In some cases, these meter-reading periscopes are fitted with flashlight bulb at the top and a push button and battery on the base of the tube suitably secured in place, in order that the gauge may be illuminated.

MAKING FLEXIBLE-CORD COVERS.



Cut a strip of cloth, any kind and any length, half an inch wide, fold it lengthwise as in Fig. 1, with the *wrong* side out if there is a wrong side, and sew a line of machine stitch down the side as shown. Don't try to sew too near the edge.

Next, run a piece of stout twine thru with a tape needle, as shown in Fig. 2. When thru, gather the upper edge of your cloth tube together, as in Fig. 3, and *sew* it to the piece of twine. Don't try to tie your twine, as that makes rather too large a knot to start thru easily.

Now hold the other end of the twine in one hand (or if your tube is very long, tie it to a door-knob) and with the other hand work the puckered end down inside, with a motion like pulling on a glove-finger, (Fig. 4). Once started, there is not the slightest difficulty.

Fig. 5 shows the end of the operation, with the completed tube coming thru, right side out, with the seam concealed, and with the extra flap serving to stuff the tube and make it plump and round. The conductor, composed of a dozen braided wires from your old Ford secondary, is run thru with the tape needle, and there you are. Cost per yard, exactly $0.00.

I have a particular affection for this invention because I had a dollar on it once —about the only dollar I ever did wring from Science. The stenographer was aiming to replace a broken belt-loop on her velvet coat, and was stumped to know how the tailor had got the seam inside. Recognizing my old process, I was explaining it to her, when the boss came in and bet me a dollar I couldn't do it. The girl made the tube, I ran the string, manipulated a second, and "Psst!" thru it went, like a rat two jumps ahead of the feline. The boss handed over his dollar, while the stenographer said something which in polite

Pst! An Alcove Secret! Our Friend Reed Tells Us How the Tailors Got the Seam Inside.

ladies' language is equivalent to—"Well, I'll be d——d!"

ANOTHER STORM GLASS OR BAROSCOPE.

Potassium nitrat.....	Gr. 30
Ammonium chlorid.....	Gr. 36
Absolute alcohol.....	Fl. Dr. 6
Alcohol	Fl. Dr. 6

Put the mixture into a bottle 18 inches in length and ¾ inch in diameter, and cover the mouth with a piece of perforated plaster.

If the weather is to be fair the insoluble matter will settle at the bottom of the tube, while the liquid remains pellucid; but previous to a change for rain, the compound will gradually rise, the fluid remaining transparent. Twenty-four hours before a storm or very high wind the substance will be partly on the surface of the liquid, apparently in the form of a leaf; the fluid in such cases will be very turbid and in a state resembling fermentation.

Contributed by ARTHUR SCHALLER.

NEARLY PERFECT — WHAT 1/1000TH INCH ACCURACY MEANS.

Such is the perfection of modern machinery that 1/1000th of an inch is a large error in metal working, tho a sixty-fourth of an inch was near enough for the craftsman of fifty years ago. Optical goods, like lenses and prisms can now be made with surfaces accurate to 1/50,000th of an inch without undue difficulty, and for the most exacting purposes of scientific research it is possible to make a flat or curved surface to an accuracy of *one millionth of an inch.*

But even such marvelous accuracy as this falls far short of theoretical precision. If the most perfect mirror could be magnified until the molecules became visible, it would appear anything but flat. In fact, when X-rays were discovered this form of radiation appeared not to be subject to regular reflection like a beam of light falling upon a mirror. This has since been found to be due to the fact that the most perfectly polished surface is relatively rough to the exceedingly short waves of X-rays, just as a sheet of paper is rough to ordinary light, and so reflects it diffused.

PREPARATION OF PYROMORPHIC CARBON.

Pyromorphic carbon is a substance which takes fire spontaneously. It is prepared from lead tartrat. To prepare the lead tartrat mix solutions of tartaric acid and lead acetat. Lead tartrat is precipitated. This is filtered, washed and dried in the air. Next an ampoule is prepared by drawing out a test tube. (See diagram.) The tartrat is now put in the ampoule and heated until no more white fumes are given off. It is then sealed at the constriction before cooling. After it is thoroly cooled and if the tip is broken off the substance when sprinkled out will burst into flame before reaching the floor.

On heating, lead tartrat decomposes, leaving lead and carbon. These are in such a finely divided state that they absorb oxygen —thereby bursting into flame.

LIGHTING A BUNSEN BURNER WITHOUT MATCHES: If a crystal of potassium chlorat is rubbed on the side of a

An Interesting Chemical Experiment of Spontaneous Combustion.

safety match box, tiny sparks of flame will result. This is due to the combustion of the phophorous on the box with the oxygen of the potassium chlorat.

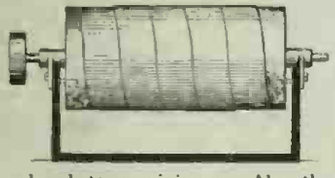
Storage-Battery Ventilation for Submarines

(1,285,659; issued to Bruce Ford)

A means of ventilating the battery cells to the exterior of the shell of a submarine whether submerged or on the surface, and an automatic way

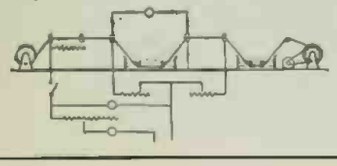


of accomplishing this object. Each one of the cells is closed and a vent pipe is connected to its interior, which is arranged to discharge thru and to the outside of the boat. An arrangement of inlet and outlet valves and an air pump regulates the discharge of the gases, acid, electrolyte, etc., that may escape from the cells by accident. Also a means of air circulation is provided around and between the cells for regulating the battery temperature.

Electrolytic Process

(1,282,262; issued to Matthew M. Merritt)

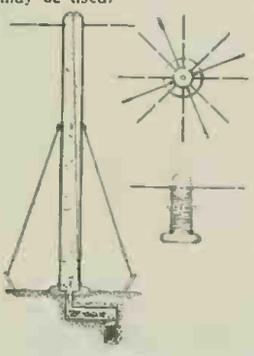
A new improvement in the manufacture of copper or other metallic sheets by electro-deposition on a rotating cathode. By proper correlation of the proportion of the surface of the cathode which is immersed, to the speed at which the cathode is rotated, the formation of rough deposits on the deposited sheet caused by liberated hydrogen may be



reduced to a minimum. Also the burning of the deposits by the use of a high current density may be eliminated, while maintaining that rapid rate of deposit which results from a high current density. Also the coarsely crystalline formation of the sheet which results from a high amperage during the deposit, may be avoided by the use of an oily or greasy coating over the surface of the mandrel, which is preferably treated with mercury.

Annealing Metal Wire by Electricity

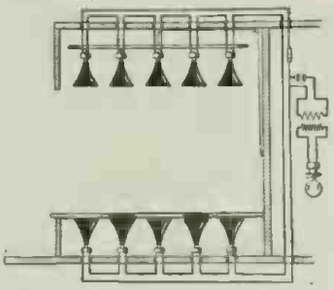
(1,285,887; issued to Herbert Alexander, Wyndham T. Vint and Arthur Imbery)



Annealing and tempering of traveling steel and other metal wire has previously been accomplisht by its being made to form a part of an electric circuit, the ohmic resistance of the wire with the requisite amount of current flowing automatically producing the desired heat. This invention improves on this process in that it consists of a means for the gradual heating of the wire when first entering the apparatus or after emerging from a cooling bath therein, or at both stages of the process. A periodicity of over 25 cycles per second is of advantage in overcoming the tendency to the production of any electrolytic phenomena which may occur.

Collapsible Wireless Telegraph Pole

(1,285,940; issued to Leon Chodakowski)

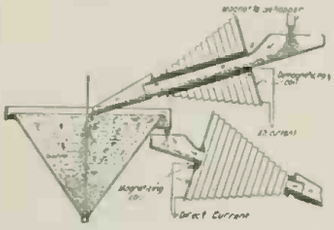


Atta-Boy, Leon! Why didn't you think of this before the war. Now we don't need it, thanks to Mr. Roger's underground radio. A wireless telegraph pole of the collapsible type for elevating the wireless antenna. It consists of a flexible and inflatable bag adapted for arrangement in pole formation when inflated and carrying wires near the top. The device is so made as to be readily filled with gas and emptied as desired. A means of carrying the gas in tanks with the signal corp section may be provided for the filling of the bag, or comprest air may be used.

Means for Recording Sounds

(No. 1,286,259, issued to Thomas A. Edison)

This invention relates to an improved method of recording sounds. Its object is the making of records for talking pictures. Where only a single horn is used to catch the sound waves a very poor impression is received on the record and many of the sound waves are not caught at all. In this invention the sound waves are collected at a plurality of points which are so separated as to extend over the field or scene. It also intensifies the impulses before they reach the recording device. A number of microphones and the receivers are connected in series while the battery and the primaries of the induction coils, corresponding in number to the receivers, are also in series with each other and the micro-

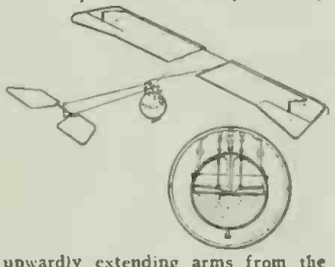


phones. The secondaries of the induction coils are in series with each other and the recorder. Therefore no matter on what part of the stage a performer may be, a recorder will always be near and enable a complete record of the sound waves to be taken.

Apparatus for Treatment of Magnetic Ore

(No. 1,286,247, issued to Edward W. Davis)

A device whereby it is possible to demagnetize magnetite ores, found in certain sections of the country. By means of this process it becomes readily possible to quickly classify the various grades of the ore. A hopper having an open top into which the ore is discharged thru a spout. This hopper also has an inclined conical spout leading from it. A coil encircles this cone thru which an alternating current is past. This conical shape has the effect of gradually reducing the influence of the

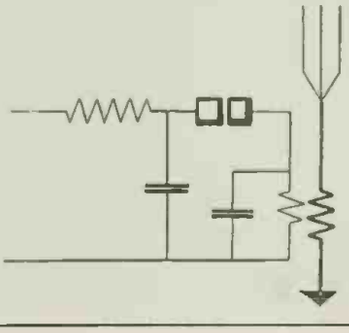


alternating current on the magnetic ore, and also prevents it from reaching a neutral point. The finer particles float away over the edge of the tank by the overflow of excess water and are remagnetized, while the heavier particles settle on the bottom of the tank.

Stabilizer for Flying-Machines

(No. 1,286,860, issued to Frank White)

A simple appliance to be used with any type of airplane for automatically controlling the balancing surfaces of the machine, thereby relieving the aviator to that extent. It comprises a hollow spherical body in two sections, with a liquid-tight joint between the top and bottom. It is adapted to contain water or other liquid, and is suspended by

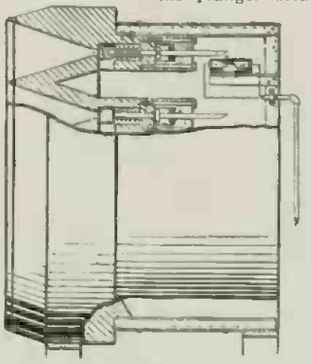


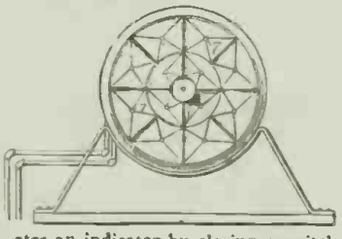
upwardly extending arms from the hangers. The arms are connected by means of pivots so as to enable the body to swing in any normal direction of flight the 'plane might assume. Any shift of this spherical body tends to raise or lower a disc which floats on the surface of the liquid and this shifting disc automatically adjusts the planes and keeps the machine in equilibrium.

Wireless Apparatus and Method Therefor

(1,279,850; issued to William Dubilier)

The apparatus consists of a simple, light weight electromagnetic vibrator intended to produce oscillations. As a closed circuit condition exists at starting the oscillations, a high primary potential is not necessary, and therefore a direct current source of energy of low voltage is sufficient to operate the apparatus. It operates most efficiently when the period of vibration of the spring of the vibrator is in a selected ratio to the natural frequency of the oscillating circuit; that is to say, when such period of vibration



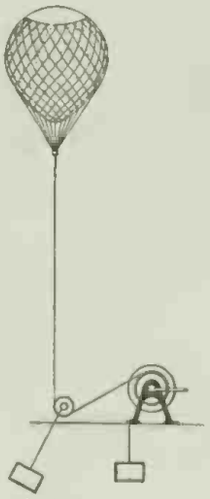


is either equal to or a harmonic of the natural frequency of the oscillating circuit.

Target Apparatus

(1,286,215; issued to Clarence H. Brainard)

Each plunger is so set in the target that it immediately absorbs all the kinetic energy of the bullet on impact and then drops the bullet into a receptacle. At the same time the movement of the plunger actu-



ates an indicator by closing a switch arranged in the path of the moving plunger, and electrically connected in the circuit with one or more annunciators, properly numbered.

Process and Apparatus for Inducing and Stimulating Rainfall

(1,284,982; issued to John G. Ballsillie)

An electrical conductor is used to form a path for the flow of energy between earth and clouds. The lower end of such conductor being connected to the earth and the upper end having a terminal of electrically conductive material. To secure effective connection between earth

and clouds it is necessary to have the upper terminal consisting of a great number of fine metallic points. For practical purposes this upper terminal consists of a mat or fabric sheet of considerable surface, with a great multiplicity of electrically conductive points, and its area is two to ten square yards.

Our Amateur Laboratory Contest is open to all readers, whether subscribers or not. The photos are judged for best arrangement and efficiency of the apparatus. To increase the interest of this department we make it a rule not to publish photos of apparatus unaccompanied by that of the owner. Dark photos preferred to light-toned ones. We pay $3.00 prize each month for the best photo. Address the Editor, "With the Amateurs" Dept.

"Amateur Electrical Laboratory" Contest

THIS MONTH'S $3.00 PRIZE WINNER—E. J. J. GOBRECHT

THE accompanying photograph shows the laboratory of this month's prize winner, E. J. J. Gobrecht, who has certainly one of the most interesting that we have had submitted for some time. Everything is systematic, and there is sufficient space to have a place for everything and everything in its place. At the extreme right may be seen an elaborate switchboard containing several knife switches as well as a specially made heavy current rheostat, current meter, switchboard lamp, testing lamps, telephone transmitter, etc. Storage batteries can be charged from this switchboard when desired, and several of them may be seen on the laboratory bench in the background. The table in the foreground contains an electrolytic interrupter operating a spark coil, a pair of home-made Leyden jars and a small Oudin high frequency coil having a primary wound with copper ribbon. Several small dynamos and miscellaneous tuning coils, loose couplers and rheostats are to be seen about the laboratory showing that the owner has been actively interested in the theoretical and practical study of electricity and wireless. The usual collection of "miscellaneous" comprises telephone parts, boxes of screws and nails, wet battery elements, chemicals, etc. A goodly assortment of tools are on hand for the construction of the various apparatus which the author happens to be interested in. Note the beautiful model of a monoplane suspended in front of the central window of the laboratory, also the partly constructed model airplane fuselage on the floor just under the center table. Also do not miss the large sketch of Dr. Nikola Tesla on the rear wall, presumably enlarged and sketched from the supplement given with the "Electrical Experimenter" several years ago. There is a phonograph in the laboratory to stimulate ideas at odd moments when the owner's "think tank" goes dry. This is a good specimen of what the average American boy can do in making up an attractive and useful work-shop in which to try out his ideas and supplement his theoretical studies with the actual application of the principles involved.—E. J. J. Gobrecht, Hanover, Pa.

HONORABLE MENTION (1 Year's Subscription to the "ELECTRICAL EXPERIMENTER")—WM. H. MOORE

I GIVE herewith contents of my laboratory. Among the usual requisites of such a laboratory there are: 1 K.W. high frequency outfit, a Mignon audion cabinet, 15,000 meter coupler, together with smaller couplers, 'phones, storage battery and condensers. I also have a motor-generator set with which I charge my own and other batteries. The chemical division I think, is fairly complete. It contains a retort, pipettes, a burette, flasks, beakers and all reagents necessary for any ordinary experiment or analysis.—also tripod, ring stand, porcelain crucible, evaporating dishes, mortar and pestle, U-tube, drying tubes, conical and cylindrical graduates, hydrometers, balance, etc. The electrical division contains among other things, several motors, magnetos, etc., also an arc light, resistance, step-down transformer, telephone transmitter and that inevitable collection of miscellaneous articles commonly known to the profession as "junk." I also have a set of Marconi-Victor Code Records and receive at a speed of from 15 to 20 words per minute.—Wm. H. Moore, Charleston, W. Va.

Science in Slang

1. From Amber to Juice

By Emerson Easterling

ILLUSTRATED BY THE AUTHOR

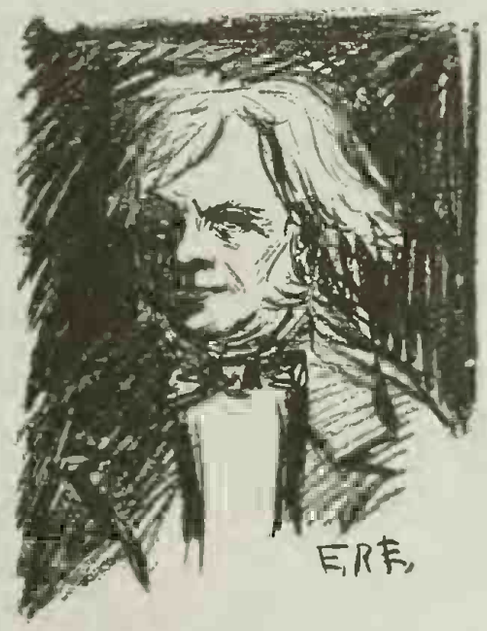
A QUEER man you will find him, Captain A. J. Stokes, deep and studious, yet a man of the world of sport and levity. He has nosed into every port in the seven seas and has seen the Amazon River looking east. It is needless to say he is independently wealthy. Yet it is evident that he has a speaking acquaintance with the more serious things of life, and has thumbed the pages of History and Science in his speedy course of life.

"Benny Franklin, the Lightning-rod Kid."

To-night he sat across the fireside from me at the club. In his hand he held a copy of a current electrical periodical. Seeing this, I ventured to ask, "What have you framed up in your noggin as being the right dope on the origin, use, nature and future of Electricity?"

He looked over at me and smiled a quaint smile. "That was just the sort of thing I was thinking of, the nature and future of the something we are wont to call 'Electricity'—but how happened you to ask?"

"Oh, I don't know," I replied; "I was just wondering about it myself—and I just wondered what you entertained as to it."



"This Tiled Roof—the Hon. W. Gilbert—Is Guilty of the Term 'Electricity'."

"I have smoked a carload of Havanas over this subject,"—he lit a cigar and lolled back in his chair—"from books and men I have gained some certain amount of knowledge concerning our 'Juice'.

"Way back in the dawn of History, when the dim diffused light of the dawning day of experience made its vague appearance thru the hydrous canopy that surrounded our terrestrial abode, the unknown force manifested itself before unseeing eyes. According to some authorities, we are not informed of any observations until a Thales of Miletus, only six hundred years before Christ, carved his discoveries of the funny things that amber would do when rubbed.

"Also a bird by the name of Theophrastus, who seemed to be an authority on gems, noted that when he shined some of his sparklers on his pant—(oh, excuse me! That duck wore a tablecloth) that the said sparkler would attract small objects like pith balls and lint from his culinary garb. Besides Thales and Rastus and a very few other guys who were 'on', old Jupe himself made the pith balls animated by the frictional performance engendered by lightning.

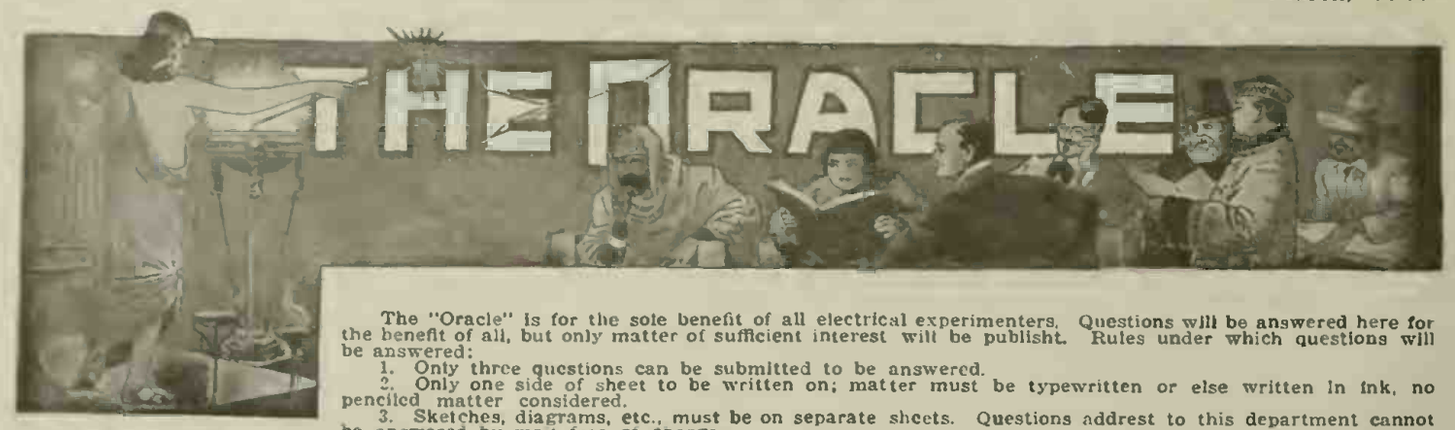
"Mike Faraday, Who Successfully 'Vamped' Dame Electra Out of a Bunch of Her Darkest Secrets."

"Funny it took so long from Creation before the old timers 'got hep' to those primary examples, isn't it? But I suppose that is what the bunch that will be here years anon will say of we present moderns.

"Of course Cleopatra must have drawn sparks from the red nose of some enamored Gaul when she shuffled across the Persian rug and did a Can-can before the Hun's grandad, some spicey morning on a winter visit up in Gallia. We know that it was static electricity, but the Egyptian Boss didn't. Neither did the Dutchman. As for that bird—it probably struck him as a severe charm of his friend, Miss Ptolemy, esq. Had you been there and slipt her the 'info' that it was what we have christened 'Electricity' that caused the prickling spark to play betwen Her Royal Ilium and Dutch's crimson beak, she would have looked at you as foolishly as could have been possible for such a sagacious female as the daughter of the Nile to look, and perhaps confess that you were talking ragtime to her. She might proffer the chatter, were she in the mood, that as near 'Electricity' as she could come was the Greek noun ηλεκτρον and the Latin *Electrum*, and

"Andy Ampère, Whom Thanks Are Due for Such Latter-day Questions as: 'How Many Amperes Has a Volt?'."

that they meant to her no more nor less than *AMBER!* Here she would probably jerk an amber dodangle from her enchanting locks and sneer, 'How could this sting me here!' clapping her jeweled digits on an also jeweled hip, 'You are dismist from court. Lack of evidence!' Whereupon you would be forced to consider yourself at bay. That was a way Cleo had about her—right or wrong.



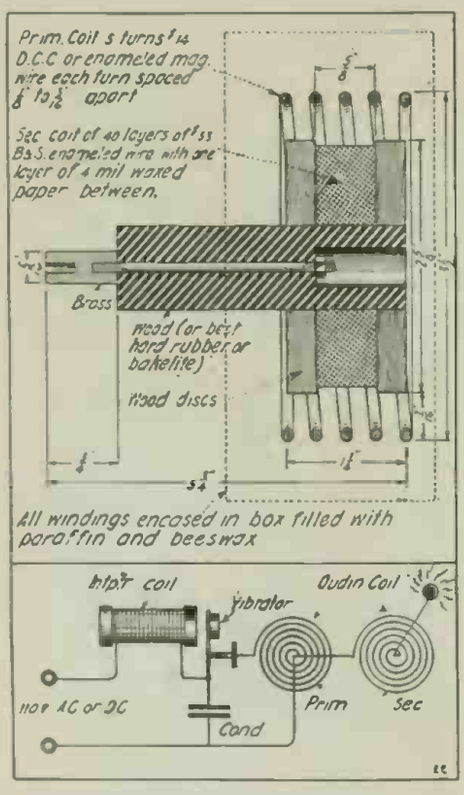
"Nevertheless you would be right and Galvani would not be as skeptical as the Queen. No doubt, he would swallow it whole and believe you outright. Then he would more than likely demonstrate his recent discoveries on the freshly murdered frogs and calves. Of course, the Bologna physician was deluded. We all know that a Prof. from the Pavian University had to set the populace right after Doc's assertion

(*Continued on page* 812)

"Prof. Volta of WET Battery Fame. This Bird Would Have Invented a DRY Battery Sure as Nails, Even If He Had Lived in 'Bone-dry' America."

www.americanradiohistory.com

The "Oracle" is for the sole benefit of all electrical experimenters. Questions will be answered here for the benefit of all, but only matter of sufficient interest will be publisht. Rules under which questions will be answered:



1. Only three questions can be submitted to be answered.
2. Only one side of sheet to be written on; matter must be typewritten or else written in ink, no penciled matter considered.
3. Sketches, diagrams, etc., must be on separate sheets. Questions addrest to this department cannot be answered by mail free of charge.
4. If a quick answer is desired by mail, a nominal charge of 25 cents is made for each question. If the questions entail considerable research work or intricate calculations a special rate will be charged. Correspondents will be informed as to the fee before such questions are answered.

COLLINS-SANCHEZ HIGH FREQUENCY 3-INCH SPARK APPARATUS.

(983) George Litty, West Phila., Pa., inquires:

Q. 1. In the November, 1915, issue of the ELECTRICAL EXPERIMENTER you publisht an article on "High Frequency Currents and Apparata," by H. Winfield Secor. Fig. 2 shows the circuit of a *Collins-Sanchez* high frequency circuit. I would like to have the following questions answered in the *"Oracle"*:

(1) The resistance of the magnet coil and how to construct it.

This High Frequency Coil Operates on 110 Volts A. C. or D. C. It Produces a 3" Flaming High Frequency Spark. The Interrupter Coil Has an Iron Wire Core 5/8" Diameter by 3½" Long, Wound with a Coil 2½" Long of No. 28 D. C. C. Magnet Wire. Outer Diameter of Coil 13/4". Vibrator Fitted with ½" Diameter Silver Contacts. Condenser 50 Sheets of Tinfoil 2¼" x 3¼", Placed between Mica Sheets 6 Mils Thick and Measuring 3" by 4".

(2) The capacity of the condenser.

(3) The size of the Oudin coil.

A. 1. We give herewith diagram of the Collins-Sanchez high frequency apparata, including the dimensions of the interrupter magnet, the condenser, and the proportions of the Oudin high frequency coil, the latter being best encased in a wax mould thoroly surrounding it.

10,000 METER LOOSE COUPLER.

(984) Paul H. Gebser, Roseville, P. T. Cal., writes for data on a 10,000 meter loose coupler.

A. 1. We give below data regarding the construction of a loose coupler for 10,000 meters:

Primary, 8 x 12" wound full No. 24 s. c. c. wire.

ODD PHOTOS WANTED AT $1.00 EACH!!!

Now is the time to make your Kodak pay for itself in a real practical way. We are after interesting photographs of out-of-the-ordinary electrical, radio and scientific subjects and are willing to pay $1.00 cash for every one we can use. Please bear in mind that for half-tone reproduction in a magazine, a photograph should be particularly sharp and clear. Of course, if a subject happens to interest us particularly well, we can have the photo retouched. For the general run of subjects, however, it does not pay to go to such expense. Therefore, please take pains to properly focus and expose your pictures. It often happens that a really mediocre subject well photographed wins approval over an excellent subject poorly photographed. And don't send us plate or film "negatives"; send unmounted or mounted "prints", preferably a light and dark one.

As to what to photograph: Well, that's hard for us to say. We leave that up to you, and every reader now has the opportunity to become a reporter of the latest things in the realm of Electricity, Radio and Science. But, please remember—it's the "odd, novel or practical stunts" that we are interested in. Every photo submitted should be accompanied by a brief description of 100 to 150 words. Give the "facts"—don't worry about the style. We'll attend to that. Enclose stamps if photos are to be returned and place a piece of cardboard in the envelope with them to prevent mutilation. Look around your town and see what you can find that's interesting.

Address photos to—Editor "Odd Photos", ELECTRICAL EXPERIMENTER, 233 Fulton Street, New York City.

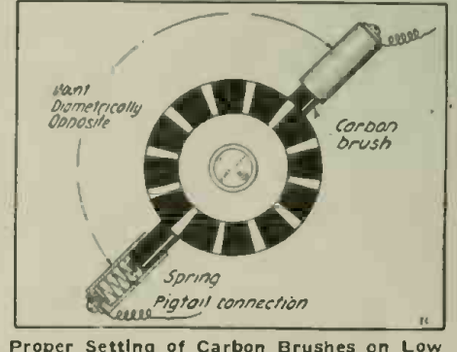
Secondary, 7½ x 12½" wound full No. 30 s. c. c. wire for crystal detector.

For use with audion, wind full with one layer of No. 34 s. c. c. wire.

NITROGEN RADIATOR FOR ELECTRIC HEATING.

(985) Harry B. Genders, Wednesbury, England, asks the Oracle Department:

Q. 1. I would be obliged if you would give me a few particulars regarding the Portable Electric Nitrogen Radiator, as described on page 464 of November, 1918, issue of "E. E." I presume the radiator is simply filled with nitrogen at ordinary atmospheric pressure. I should like to know if an ordinary hot water radiator could be converted to one of the above type? Also would it do if simply filled with air at atmospheric pressure? I suppose the efficiency would not be as great as with nitrogen filling.



A. 1. With reference to converting an ordinary hot water radiator to an electrically heated type, most probably with a little ingenuity you could do this, but, of course, it will not be as efficient as the nitrogen filled radiator. There are several electrical radiators on the market on the principle of the simple form as you suggest, i.e., comprising nothing more than a suitably protected and insulated electrical heating element, which is caused to either heat up water with which the radiator is filled, or in some other way to produce heat in the ordinary manner.

LOW VOLTAGE, HIGH AMPERAGE DYNAMO BRUSHES.

(986) John Voorhees, Jr., Kennett Square, Pa., says:

Q. 1. I have a low voltage, high amperage dynamo fitted with copper leaf brushes. How can I apply carbon brushes?

A. 1. Concerning the replacement of the copper leaf brushes on your small dynamo by carbon or woven wire brushes, the appended diagram, we believe, will cover your requirements very nicely. Many of these small dynamos are successfully changed over in this way. The brush holders being either of the round or square pattern, should be clamped or in some way secured to the brush holder studs on your present rocker arm. You can obtain the round type brass brush holders complete with springs and brushes from any electrical repair shop or electric fan dealer.

Proper Setting of Carbon Brushes on Low Voltage Dynamo, These Replacing Flat Copper Brushes Which Did Not Prove Satisfactory.

When the round type of brushes are used

FREE Test Lesson In Draftsmanship

Send for this free lesson which explains the Chicago "Tech" method of teaching Draftsmanship by mail. Positions at big salaries are now waiting for competent men. Even draftsmen of limited training and experience are snapped up and paid good salaries. If you are dissatisfied with your opportunities, learn Draftsmanship. Chicago "Tech" will train you in the most practical way in the shortest time. Mail the coupon today and let us tell you about the Chicago "Tech" method. The free lesson will show you how well equipped you are to follow Draftsmanship. Enroll in the course only if you decide that you can take it up to advantage. No cost, no obligation on you to make this investigation. Send the coupon.

$25 to $100 a Week

Draftsmen always command good salaries. And now when American industries are to be called upon to meet vast foreign and increased domestic demands, the opportunities are greater than ever. This is the time for you to prepare for a better position—a higher salary.

Come to the College or

Learn At Home

Hold you present position while training. Our experts will instruct you by mail. Only your spare time is required. You are directly under practical draftsmen and engineers. You are taught exactly the work required in the drafting rooms of big concerns. No time put in on unnecessary studies. This means thorough instruction and early graduation.

Easy Payments

The fees for Chicago "Tech" Courses are very moderate—and you can pay on easy terms. And also, you obtain in a few months what it would take several years to acquire by ordinary methods. You can get an early start. You are soon ready to take a paying position and to quickly get back the cost of your course. Then keep on earning more.

FREE Instruments

Every student of the Chicago "Tech" mail course in Draftsmanship receives this set of instruments, or a cash credit in case he already has a set. These instruments are of the same make and sizes as are used by high salaried experts in drafting rooms of factories, shops, railroads, etc. You use them while learning—then take them right into your practical work.

Auto and Gas Engine Course

All about automobile mechanism—its construction, operation and REPAIR—taught by mail. You train directly under the Chicago "Tech" automobile experts. Splendid opportunities open now. Send coupon and get all the facts.

Learn All This in Spare Time

Principles of the Automobile. Every point made clear about the basic principles of propulsion—steam, gas and electric cars. Power transmission systems in pleasure and commercial cars, etc., etc.

Gasoline Engines. All about the different types. A complete course in gas engine construction, operation and repair.

Power Plants and Transmissions. Application of power by 4-6-8-12 cylinder engines. Types of clutches, gears, drives, axles, etc.

Carburetors and Fuel Supply Systems. All methods demonstrated. Fuel values. How to test. Gasoline and air mixtures. Regulation, care and management, etc., etc., etc.

Lubrication and Cooling All about oils and how to test them. Splash and circulating systems. Operation in different cars explained. Diagrams and tables. Cooling systems completely illustrated, etc.

Batteries. Electrical principles explained. Instructive diagrams of wiring and connections. Coils, condensers, vibrators, etc., etc.

Magneto Ignition. Principles and practical operation of various types and systems with diagrams. Generation of current. Field, armature, high and low tension, all explained. Complete in every point.

Starting and Lighting Systems. All modern methods. Starters—spark, mechanical, air, acetylene, electric, battery—shown in detail with diagrams and full explanations. Charging. Motor and Generator adjustments, etc., etc.

Know How to Find and Fix Troubles

Most complete instruction in auto repair work. Equips you for high pay or to start a business. Big demand for trained repair men and men who know how to inspect cars. This course makes you proficient. Prepares you to take a job as an expert. Not enough competent men now available.

WRITE Send the coupon and get catalog and all information about the Course, the small fee and the easy terms. All this sent on request. Mail coupon now.

Send the Coupon—Now

The sooner you are prepared the sooner you will be holding a job that pays a large salary and opens the way to advancement. Many executives, general managers and superintendents began as draftsmen.

Other institutions ask you to pay first—and then to find out later how well qualified you are for this profession. We send you the free lesson first and place you under no obligation at all. Discover your qualifications before you pay anything.

The coupon will bring the Test Lesson, free. Also information about the profession of Draftsmanship and detailed facts about Chicago "Tech" methods, the fees, terms, etc. Mark with X the branch you are interested in—or if in doubt about which course to take, write a letter stating facts about yourself and asking our advice which will be freely given. Mail either the coupon or letter today.

CHICAGO TECHNICAL COLLEGE,
345 Chicago "Tech" Building, Chicago

Without obligation to me, please send me your FREE Test Lesson and other interesting literature covering the subject indicated below.

THE ORACLE.

(*Continued from page* 800)

a sufficient number of them should be employed to take care of the comparatively heavy current of these low voltage machines. Sometimes two or three can be placed in a row on most of the small commutators. Also a very good brush for this machine, and one of the very best that the Editor of this Department has come in contact with in his extensive motor repair experience, is that having a special graftite-carbon brush body about 1½" wide by ⅜" thick, with a woven wire core or center.

WINDINGS FOR SMALL A. C. INDUCTION MOTOR.

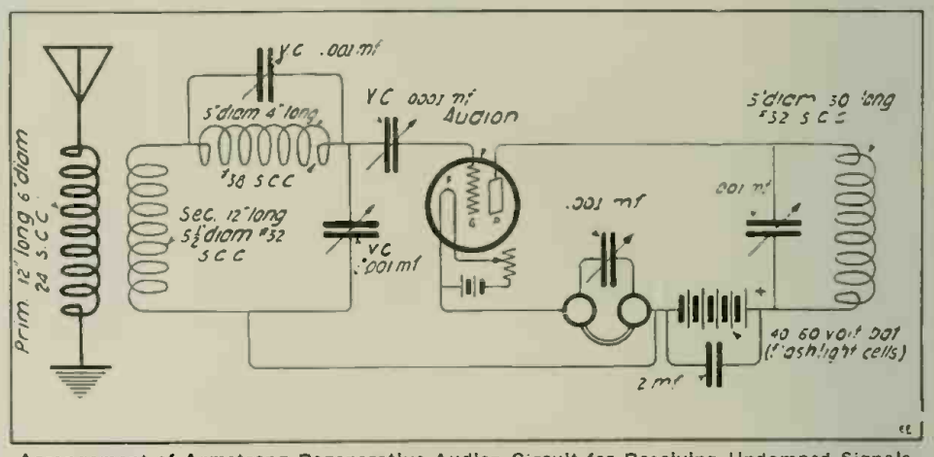
(987) Harry Ostness, River Falls, Wis., asks:

Q. 1. The diagram herewith shows an induction motor which I wish to wind so as to operate satisfactorily on 110 volts, 60 cycles, A. C. Can you give me data for starting and running coils?

A. 1. With regard to your query concerning the rewinding of a small 12 pole A. C. induction motor, we are pleased to give you the following sugestions on your problem:

To start with you might try winding each of the stator poles with a coil composed of four layers of No. 20 D. C. C. magnet wire. These coils are best wound on a form in a small winding jig or in the lathe, and tied by means of four springs, one in each corner of the form so as to hold the coil in shape. In repair shop practise, these coils are sometimes wound on a form in the manner mentioned, and afterward taped with white cotton or linen tape, using narrow tape in this instance, or if only a wide tape can be obtained, then this should be split. The coils may be given a coat of black asphaltum, but in most cases a piece of *fish paper* is placed around the pole-piece and the coil then placed over this, and after all the coils are in place, the windings are treated with a liberal coat of orange shellac. All of these *running* coils should be connected to give alternate north and south poles.

Regarding the *starting* coils, these may be composed of about 20 turns of No. 26 D. C. C. magnet wire, wound on a form so as to slip over one side of the pole-face. Then all coils are connected up in series to give alternate north and south poles. It may be said that the running coils and the starting coils are connected up in two circuits; the starting coils being invariably provided with an automatic centrifugal switch mounted on the shaft of the rotor so as to open the circuit as soon as the motor has attained synchronous speed.



In this conection, we believe you will do very well to try the copper or brass *shading plates* which are also extensively employed. These are used on a number of the commercial A. C. induction motors below ¼ h.p. in size. They are about ⅛" thick and have a slot in them so as to fit over the half-projection of the pole shoe. One or two laminations on either side of the pole shoe are then bent over and hammered down to retain the plate in position. The rotor will revolve in the direction of the plates; to reverse the direction of the rotor, the plates should be placed on the other half-projection of the pole shoe so as to face in the opposite direction, or else the stator frame should be reversed in position. All of the shading plates, of course, must be placed on the same relative side of the stator poles in any case. To reverse the direction of a motor supplied with a starting winding instead of shading plates, the leads connecting this circuit to the 110 volt supply are reversed.

THE ARMSTRONG AUDION CIRCUIT.

(988) John M. Burrell, Pittsburgh, Pa., asks for:

Q. 1. Data on condensers, inductances, etc., for the "Armstrong" regenerative audion circuit.

A. 1. Herewith is a typical Armstrong regenerative receiving circuit. As all dimensions are given in the diagram, we deem it unnecessary to go into further details.

Arrangement of Armstrong Regenerative Audion Circuit for Receiving Undamped Signals. The Dimensions of Inductances and Capacities Are Given in the Figure.

ARC WELDING QUERIES.

(989) Wm. S.——, Torrington, Conn., writes:

Q. 1. Can arc welding be done with regular city lighting circuit of 110 volts A. C. rectified to D. C.? Would common iron wire resistance be sufficient or would a special low voltage transformer be necessary?

Q. 2. Can oxygen be produced by the electrolysis of water by 110 volt D. C.? Would a solution of acid be necessary to act as a conductor? Would the oxygen be pure enough to use for welding, brazing or burning out carbon in motors? Could any useful amount be had?

A. 1. Concerning arc welding you will find very valuable information on this work contained in a recent paper by Mr. Horner on the electric welding of steel ships read before the Philadelphia Section of the American Institute of Electrical Engineers. Copy of this paper can be obtained by mentioning the subject and the author, and writing to the Secretary, Mr. F. L. Hutchinson, A. I. E. E., 33 W. 39th Street, New York City.

Also you will find a very good article on this subject in the December issue of the ELECTRICAL EXPERIMENTER. A typical arc welding outfit is illustrated and described therein, including A. C. motor and D. C.

"Humanize" Your Talking Machine

If you have been using an ordinary reproducer on your phonograph or talking machine, you have been missing the *real* music. You have failed to hear the beautiful overtones which musicians listen for—you have heard but a poor imitation of the composition as originally played or sung by the artist. The true tone coloring is not—*can not be*—faithfully reproduced by ordinary reproducers.

It took ten years of hard study and constant experimenting to develop and perfect the *one* reproducer that *does faithfully* bring to life all there is in the record. It is called the

Ellis "Music-Master" Reproducer

Now being used by thousands of music-lover owners of talking machines—and every one of them enthusiastic in praise of its wonderful merits

Below we reproduce just a few of the thousands of unsolicited testimonial letters we have received. Read them—they are more convincing than anything we could tell you.

What Satisfied Users Say

MR. J. H. ELLIS,
Milwaukee, Wis.
My Dear Mr. Ellis:—
It is delightful to listen to records played with your "Music-Master" Reproducer; it brings out certain niceties and details I bad decided could not be recorded or else not reproduced.
Your reproducer certainly is a marvel.
Last week when Galli Curci sang here with the Chicago Opera Company it was necessary for me to explain to one of my advanced students that it was not Galli Curci, in person, singing in your laboratory next to our "Studios" but one of her records played with your "Music-Master" reproducer.
This proves that the little invention speaks for itself which should be very gratifying to you.
Wishing you success, I remain,
Very truly yours.
FLEETWOOD A. DIEFENTHAELER, *Director.*

A Chicago customer says—
"Your latest Ellis "Music-Master" Reproducer reached me several days ago and I have tried it out in every shape and form and it is simply a revelation, a wonder, a thing of beauty and a joy forever. I am delighted beyond my fondest dreams. I tried one of Caruso's hardest records with the loud steel needle, also my hardest band records and never a blur or discordant note.
"I spend my spare time enjoying the marvels of the "Music-Master" and the longer I use it the harder it is to stop. We have never enjoyed our records as completely."

One enthusiastic user says—
"There is more music in my records than I imagined possible until I discovered it by means of your Reproducer."

Another user says—
"The "Music-Master" Reproducer brings out the musical and tone coloring true to Life."

And another—
"The reproduction of the human voice is wonderful and the rendition of violin as true to the artist's performance as when making the record even to the down touch of the bow."

Still another says—
"I would not sell my Ellis "Music-Master" for a thousand dollars unless I first got another equally good."

J. H. ELLIS, ***Patentee and Manufacturer***
P. O. Box 882 MILWAUKEE. WIS.

You must hear the "Music-Master" to appreciate its great merit

Words cannot convey to you an adequate idea of how much this wonderful little device will do to improve the playing of records. You must see it—hear it—compare the effect with any and all other reproducers you know of; then you will understand why every music-lover owner of a phonograph who hears the "Music-Master" Reproducer wants to own one.

For all machines—
Plays all Records

No matter what style, size or make of talking machine you have if it uses disc records you can use the Ellis "Music-Master" and enjoy the *real* music. The "Music-Master" is easily put on any machine—it does not harm the records; in fact it prolongs their life, because it is much lighter in weight than other reproducers.

Write Today for Full Details

Fill out and mail the coupon below. If you will also enclose 10c in stamps, I will send you a valuable little booklet entitled "Pointers on the Care of Talking Machines and Records." But, send the coupon for full details about the "Music-Master" Reproducer whether or not you wish the booklet.

MAIL THIS COUPON NOW!

If You Need Training Read This Guarantee

We guarantee at any time during the first year of your enrollment to refund the entire amount paid if immediately upon the completion of 10 examinations you notify the school you are not satisfied with the Course

SOUNDS convincing, doesn't it? Better still, it means if we make good, YOU MUST. More than that, it show's we're confident in our ability to fit you for the Big Job—and the pay you'd like to get. If you want to succeed, but are handicapped by the lack of training, NOW is the time to make us MAKE GOOD. We can't come to you—but the Coupon below will bring us together in such a way that you can't lose a cent. We're ready to make good. YOU CAN IF YOU WANT TO.

NO STRING TO OUR OFFER

There's no quibbling about the American School guarantee. *You're either satisfied or you are not.* After the tenth examination, if you feel that you are not getting practical, money-making instruction, **knowledge you can cash in on,** simply notify us you are not satisfied with the Course and you are not out one cent. We accept students on no other basis but that of satisfaction or money back.

IT'S YOUR MOVE

You've read our Guarantee—you know that training will pave the way for promotion and better pay—you know you can't hope to really get anywhere without specialized instruction—so why not GET IT? The first move for a bigger and better future is to check and mail the Coupon. We'll promptly mail you Free Bulletin and full details of Money-Back Guarantee.

THE ORACLE.

(*Continued from page* 802)

generator, as well as regulating inductances for controlling the arc voltage, which is about sixty to seventy volts usually.

A. 2. With reference to producing electrolytic oxygen from water, would advise that this is done right along commercially, and full information as to the apparatus used may be obtained by communicating with the International Oxygen Company, New York City.

This method of producing oxygen (as well as hydrogen) by passing a direct current thru vats containing water is used in the Army Balloon Corps; the lighter or hydrogen gas being used in this case for filling the balloons while the oxygen is used for oxy-acetylene welding outfits, flame throwers, etc.

The method of producing the gas consists in increasing the conductivity of the water by adding sodium bicarbonat or sulfuric acid, and a series of multiple and alternately charged, perforated metal plates are immersed in the water, one set of plates being positive and the other negative. Hydrogen gas collects at the cathode or negative pole, and oxygen gas at the anode or positive pole. You would do well in this connection to look up any chemistry book and also refer to some of the back lessons of the "Experimental Chemistry" course publisht monthly in the ELECTRICAL EXPERIMENTER, where this electrolytic apparatus has been described.

The production of the two gases causes the decomposition of the water into its constituent elements due to the passage of current thru the water. The large electrolytic generator used at the Army Balloon School at Fort Omaha, uses bicarbonate of soda. The weight of the oxygen gas liberated by a certain quantity of electricity will be about eight times that of the hydrogen gas, but the oxygen gas will occupy only one-half the space that the hydrogen gas occupies, since a given volume of hydrogen gas is approximately one-sixteenth as heavy as the same volume of oxygen gas, and as a result the volume of gas collected in the negative electrode chamber will be practically twice the volume of gas collected in the positive electrode chamber.

THE MAINTENANCE OF WIRELESS TELEGRAPH APPARATUS, by Percy W. Harris. Cloth bound, pocket size, 4¾ inches by 7¼ inches. 127 pages, illustrated. Publisht by The Wireless Press, Ltd., London. Price 90 cents.

A handy pocket manual primarily intended for the radio operator aboard ship who usually handles Marconi equipment and as such it serves its purpose. Much of the material has been covered in many other previous works on this subject so that a partial list of the contents will serve to give an idea of the ground covered. General information, such as the care of the wireless cabin, taking over the apparatus, inspections, etc. Preparing installations for laying up, transmitting apparatus, marine switchboards and their care, motor starters, converters, keys, transformers, condensers, disc dischargers, receiving apparatus, the care of the same, also the replacing of parts, the aerial and its fittings, the lead-in and the care of insulators.

A very complete chapter on the storage battery is included, which explains how to take care of the battery while in actual use, also some remarks on storing away the battery if it is to be taken out of service for any length of time. A brief concluding chapter treats on the Marconi wavemeter and its adaption to the measurements aboard ship, such as the wave length of the transmitted and incoming wave lengths.

This book is very brief in its explanations and presupposes on the part of the reader a previous knowledge of the theory of radio circuits and apparatus. Similar books have appeared on this side of the Atlantic which have been much broader in scope so far as the commercial ship radio equipment is concerned at any rate.

MODERN WIRING DIAGRAMS AND DESCRIPTIONS FOR ELECTRICAL WORKERS. by Horstmann & Tousley. 298 pages, 207 illustrations, size 6¾ x 4½ inches. Cloth bound $1.00, leather bound $1.50. Publisht by Frederick J. Drake & Company, Chicago, Ill.

This work forms a tried and true friend of the electrician and wireman. There are over two hundred diagrams of electrical apparatus covering every conceivable device with which the every-day electrician will come in contact with and be called upon to connect up, including diagrams and connections for various types of bell and telephone circuits, including the inter-communicating system so widely used in residences and offices. One section deals with connections of telegraph instruments and diagrams are given showing the connections for the electrical writing instrument known as the "Telautograph." Other sections deal with the connections of X-ray and gas lighting apparatus, primary batteries, storage cells, locating faults on circuits, electric lighting circuits and arrangements for two and three-way switching, house and office building wiring, theater lighting, etc., etc.

Other descriptive chapters, together with complete wiring connections, are given covering arc lamps, the Nernst lamp, the Cooper-Hewitt lamp, etc. Recording wattmeter hook-ups are given as well as "demand meters"; diagrams, also circuits for shunt and compound-wound motors, automatic starters, drum controller connections, street car hook-ups, electric automobile circuits, direct current and alternating current dynamo and switchboard connections, the action and connection of motor-generator compensators, transformers, switchboards, ground detectors, storage battery charging panels—with and without boosters, testing of circuit troubles and the use of the Wheatstone bridge, wiring tables giving the size of wire for various loads and circuit runs, et cetera. The closing chapter treats on electric signs, flashers and display lighting.

THE BOY'S BOOK OF SUBMARINES, by A. Frederick Collins. Cloth covers, illustrated, 220 pages, size 5 x 7½ inches. Publisht by Frederick A. Stokes Company, New York. Price $1.35.

A most interesting exploring trip into the How and Why of the submarine in plain everyday language that we may all read and understand. The important part played by this work is that it gives the uninitiated a clear and comprehensive digest of just how the "terror of the seas" operates and functions.

From the theory to the completed submarine each detail is carefully explained as the following list of contents shows.

The First of the Submarines—How to Make and Work a Model Submarine—How a real Submarine is Made and Works—The Heart of the Submarine—Making and Shooting the Torpedo—Making the Submarine Deadlier—The Wonderful "Eye" of the Submarine—The Marvelous Tongue and Ears of the Submarine—The Crew of the Submarine—How the Submarine Attacks—The New Submarine Chasers, the Last Word in Submarines.

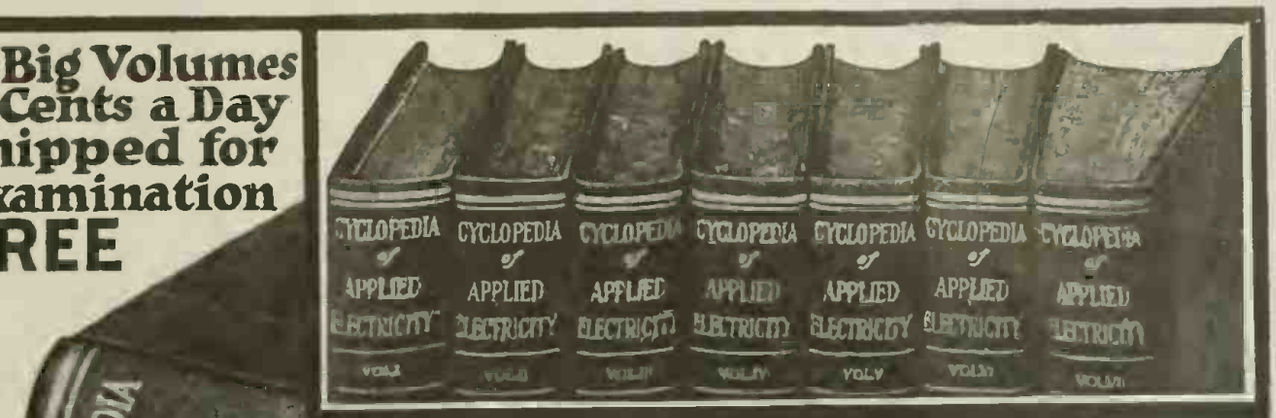
The chapter devoted to the periscope is very thoro and clearly illustrates the principle on which it works. Directions are given for the construction of a model periscope much on the line of those in practical use.

Methods of signaling play an important part in the successful operations of the under-sea boat and these various means are given a great deal of attention. Particularly we might mention Radio—Semaphore—The Submarine Bell—and the conductivity or under-water "Wircless" which operates on a system of copper plates—induction coils, phones and a current source.

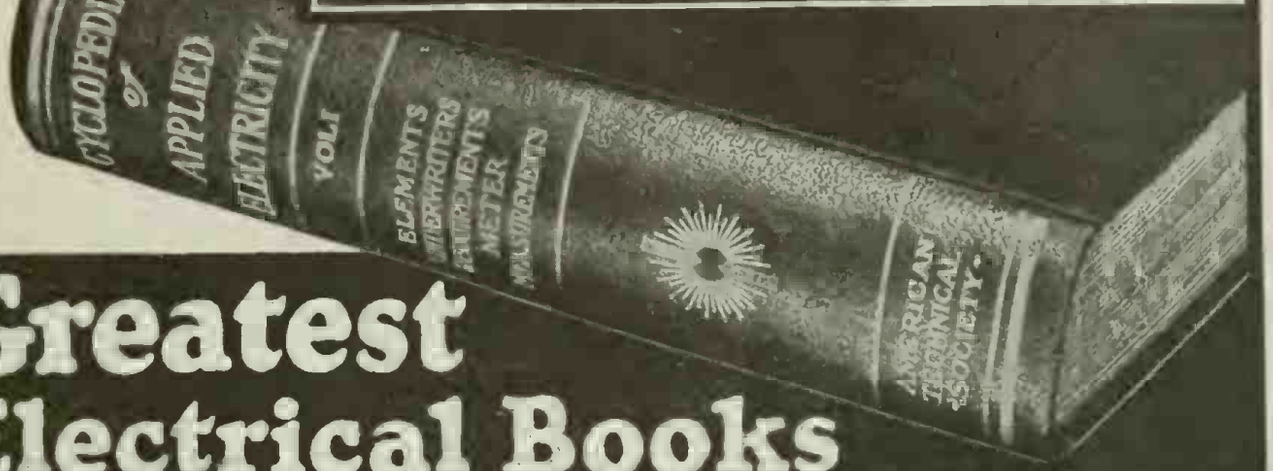
It is a very neat volume and the author has evidently done his best to enable the layman and experimenting youngster to grasp the mysteries of the U-Boat. Deserving of mention is the chapter on how to construct a real live working model that will make all these principles clear.

MILITARY SIGNAL CORPS MANUAL, by J. Andrew White. Cloth bound. 562 pages, 260 illustrations, size 5 x 7½ inches. Publisht by Wireless Press, Inc., New York. 1918. Price $1.50.

An interesting and practical volume which has undoubtedly been of great aid to all Signal Corps men during the war and which will find a place in peacetime activities of the Army.



Each and every detail, such as personnel, organization, drill instruction, various components of the different branches of a corps are described fully so that a beginner has a wealth of information at hand. Nothing is too small to escape mention, nothing is omitted.



A partial list of the contents will serve to give the scope of this work—The Signal Corps' relation to the line of the Army—Aircraft—Government and Administration—Commands and Signals—Physical Training—Instruction with Arms—The Company Mounted and Dismounted—Field Signal Troops—The Wire Company—The Radio Company—Telegraph Company—Reviews—Inspection—Manual of the Saber. A most complete chapter is devoted to technical instruction and apparatus, covering fundamentals of electro-magnetism, bat-

The Electric Current: Resistance--Underwriters Requirements--Power Stations and Equipments--Outside Wiring--High Tension--Special Installations--*Electrical Measurements:* Instruments--Measuring Methods: Resistance Insulation--Distribution Systems--Watt-Hour Meters: Construction, Installation, Testing.

Vol. II. *Dynamo Electric Machinery:* Magneto Electric Induction--Generators--Construction--Practical Design. *Types of Generators and Motors:* Direct and Alternating Generators and Motors. Motor Generators--Induction Motors.

Vol. III. *Direct Current Motors:* Efficiency--Torque--Speed--Power--Multi-Voltage Systems. *Management of Dynamos and Motors:* D. C. and A. C. Plants--*Lighting:* Incandescent Lamps--Tungsten Lamps--Nitrogen Filled and Mercury Vapor--Arc Lamps--Residence--Photometry.

Vol. IV. *Alternating Current Machinery:* Simple Alternator--Instruments--Polyphase Systems--Armature Windings--Transformers--Rectifiers--Motor Generators.

Vol. V. *Power Transmission:* Conductors--Distributing Systems--Voltage Regulation--Underground Construction--*Electric Railways:* Car Equipment--Maintenance--Power Plants--Signal Systems.

Vol. VI. *Power Stations:* Plant Location--Electrical Equipment--*Switchboards:* Wiring Diagrams of Connections--Switchboard Apparatus. *Storage Batteries:* Types--Charging and Discharging--Troubles and Remedies--Small Battery installations. *Applied Electrochemistry:* Metal Refining and Plating--Chemicals--Electric Furnaces--High Tension Work.

Vol. VII. *Modern Land Telegraphy. Wireless Telegraphy and Telephony. Electric Elevators. Electric Heating. Welding.*

Note:--This is but a partial list of contents. The set contains every electrical subject known!

7 Big Volumes—Written by 27 Great Authorities—Yours for 7 Cents a Day

THE hardest way to learn Electricity is through your *own experience.* The *easiest* way to learn is through the experience that *others have paid for in time and money.* Here in practical, easy-to-understand form, you get the benefit of what *27 greatest electrical* authorities in America and all over the world have learned, and you get this vast fund of experience in convenient book form, so that you can read and study in your own home in your spare time.

This is the greatest opportunity of your life to become an electrical engineer, sub-station operator, dynamo tender, or to get any one of the other big-pay jobs in the electrical field. For less than you spend for tobacco or movies, you can train yourself to step up to the jobs paying $2,500 to $5,000 a year.

Shipped on Free Examination

No Money in Advance

Just glance at the partial list of contents of these 7 volumes in the panel at the left. Think how much there is for you in this great home-study library of electricity. Then write at once for the books themselves. Examine them in your own home for a week. Send them back if you are not satisfied. But if you decide to own this pay-raising set, send only $2 and then only $2 a month until the special half price is paid. Examine the books—see how they take you through every detail of each special branch of electricity. See how they give you all the necessary tables and formulas in simple, untechnical form. Note the frequent test questions which enable you to *examine yourself.* Note the 2,600 illustrations, full page plates, diagrams, etc. You be the judge of their value to you!

HALF PRICE—NOW

For a limited time we are offering this remarkable self instructor Electrical library at half price. Regular price $35—special price $19.80 on easy terms of only 7 cents a day. With each set we include a year's Consulting Service Membership free—worth $12. The 7 volumes contain 3,000 pages, each 7 x 10 inches, bound in American Morocco, Gold Stamped.

Mail Coupon—Send No Money

If you are interested in electricity you need these books. You will prize them for the new, up-to-date information they give you on every phase of electrical work. We ship the 7 volumes right to your home on your simple request. Send no money until you *are satisfied* after 7 days free examination. Put your name and address on the coupon now and send at once before this offer is withdrawn.

Let Me train YOU in AVIATION

Captain George Fredrick Campbell, Formerly Third Ace of the Royal Flying Corps. Chief Instructor National Aero Institute

This is the real game for the He-Man, the fellow with the red blood in his veins. Aviation has been the dominant factor in war and will be the greatest industry in peace. The young man who masters this profession may be one of the pilots of the

AIRPLANE FAST MAIL

between Chicago and New York! One hundred and fifty miles an hour and better! The country demands trained men for work in the air and on the ground.

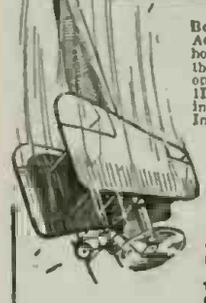
LET ME TRAIN YOU

for one of these big paying jobs. Two airplane concerns agree to take our Mechanics, Engineers, Inspectors, etc. Why don't you decide right now to take my

Home Course in Aviation under my direction. I will give you the inside facts about this great industry. Send today for our **FREE BOOK** and I will write you a personal letter along with it. Address as follows:

CAPT. GEO. F. CAMPBELL. Chief Instructor, National Aero Institute. Dept. 7443. Morton Building, Chicago, Ill.

---Fill out this Coupon and mail To-day---



Capt. George F. Campbell, Chief Instructor.
National Aero Institute. Dept. 7443. Morton Building. Chicago, Ill.

Dear Sir: Please send me absolutely free and prepaid your book on the Science of Aviation, and full particulars of your mail course in the Principles of Aviation.

Name .....

Address .....

BOYS Build and Fly Your Own Training Plane

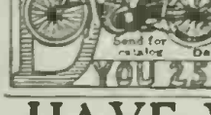
Train yourself in Aviation. Be an Amateur Aviator with an Aeroplane of your own. Learn how Aeroplanes are built; learn the principles of construction, operation and control. We sell IDEAL Accurate Scale Drawings, and Building and Flying Instructions which show you how to build a perfect Model Aeroplane, 3 ft. size, that will rise from the ground by its own power and fly like a big one. Send now for the Drawings and Instructions for the one you want to build.

Drawings and Instructions for
Curtiss Military Tractor
Biariot Monoplane
Nieuport Monoplane
Taube Mooplane
Curtiss Flying Boat
Wright Biplane
Cecil Peoli Racer
25c EACH
Set of Seven $1.50 postpaid

Ideal Model Aeroplane Catalog 5c—None Free
Tells about Model Aeroplanes, Racing Aeroplanes, Flying Toys, and parts and supplies to build them with. 48 pages. Sent only upon receipt of 5 cents.
IDEAL AEROPLANE & SUPPLY COMPANY
76-82 West Broadway New York City

35 MILES PER HOUR

Is Record Of This Car



Built by a boy from Junior parts furnished by us. Any boy can build this car. Parts very cheap. Send 26 cents for blue prints and price list of parts showing how to build this speedy little car.

Experimental Physics

(*Continued from page* 785)

back and forth. A sulfur bead for insulation such as F, in figure 98, is best made as follows:

Heat a small quantity of stick sulfur in a clean evaporating dish until the sulfur melts. When it becomes a clear liquid amber in color, dip the end of the rod G into it. Withdraw the rod and allow the sulfur to harden. Repeat this operation until the bead has grown to the desired size.

Experiment 110.

In conducting experiments with the electroscope all parts except the gold leaf system should be connected with the earth; since any part insulated is likely to become charged slightly and owing to the extreme sensitivity of the instrument, the gold leaf system would thereby be disturbed.

We will now proceed with the fundamental experiment of charging and discharging the electroscope. Rub an ebonite rod or ordinary fountain pen with cat's fur or flannel or your coat sleeve (or a glass rod with silk.) Bring this charged rod in contact with bent rod B, at the same time turning B so that it touches the rod G. Now by means of the charged rod charge will travel thru the conductor B to G and therefore G and the gold leaf, having the same charge, will repel each other. Since the rod G is rigidly fastened and the leaf H is not, H will spring away from G. Now by means of the charged rod bend rod C away to position of figure 99-B. Since G and H are insulated from the rest of the electroscope the charge cannot leave and the electroscope is now *charged*. To *discharge* touch the finger to the bent rod and bring the rod into contact with the gold leaf system H-G. The charge will pass to the finger and thru the body to the earth.

Experiment 111.

After the electroscope has been charged and allowed to stand awhile we find that it loses its charge slowly but surely. The rate at which the charge is lost, is called the *natural* leak of the electroscope. To measure the natural leak, set up a telescope pointing at the window of the electroscope as in figure 100-A. A paper scale may be attached in the electroscope behind the gold leaf system so that the field of view of the telescope, will appear as in figure 100-B. Take readings of the telescope at equal intervals of time and the average will give a good approximation of the natural leak.

Experiment 112.

We cannot determine the presence of radio-active substances in a compound or mixture by chemical means, because these substances are found in such small quantities. We may, however, detect their presence as Becquerel did by the use of the photographic plate or by the use of the electroscope, by which method Madame Curie discovered Radium. (See Experiment No. 108). Let us recall the passage of electricity thru a liquid. The liquid ionizes and we call it an *Electrolyte*. In a similar manner, a gas ionizes, the velocity of the ions in the gas being tremendously greater than that of the ions in the electrolyte. This explains the natural leak of the electroscope, i. e., the air is somewhat ionized, depending upon atmospheric and other conditions.

Place the electroscope near the stove or radiator. We find that the natural leak of the electroscope is the same, i. e., heat does not cause any additional ionization of the air. If however a Bunsen flame is placed

The Man Who *Wouldn't* Stay Down

He was putting in long hours at monotonous unskilled work. His small pay scarcely lasted from one week to the next. Pleasures were few and far between and he couldn't save a cent.

He was down—but he *wouldn't stay there!* He saw other men promoted, and he made up his mind that what they could do *he* could do. Then he found the *reason* they were promoted was because they had special training—an expert knowledge of some one line. So he made up his mind that *he* would get that kind of training.

He marked and mailed to Scranton a coupon like the one below. That was his first step upward. It brought him just the information he was looking for. He found he could get the training he needed right at home in the hours after supper. From that time on he spent part of his spare time studying.

The first reward was not long in coming—an increase in salary. Then came another. Then he was made Foreman. Now he is Superintendent with an income that means independence and all the comforts and pleasures that make life worth living.

It just shows what a man with ambition can do. And this man is only one out of hundreds of thousands who have climbed the same steps to success with the help of the International Correspondence Schools.

What about *you?*

Are you satisfied merely to hang on where you are or would you, too, like to have a real job and real money? It's entirely up to you. You don't *have* to stay down. You *can* climb to the position you want in the work you like best. Yes, you can! The I. C. S. is ready and anxious to come to you, wherever you are, with the very help you need.

Surely when you have an opportunity that means so much, you can't afford to let another priceless hour pass without at least finding out about it. And the way to do that is easy—without cost, without obligating yourself in any way, mark and mail this coupon.

Big Money for Boys!

Learn ELECTRICITY

There is a wonderful opportunity right now for boys who like electricity. Boys who are ambitious and will train themselves in spare time can step into positions just as soon as they are ready. Good salaries are offered to start with splendid chances for rapid promotion.

For 27 years the International Correspondence Schools have been training boys for success in electricity and over 200 other subjects. They will help you prepare right at home for a position in the line of electrical work you like best—or in any other work that appeals to you. Thousands of boys, through I. C. S. training, have stepped into fine jobs, but never were opportunities so great as now.

Let the I. C. S. help *you*. Choose the work you like best in the coupon below, then mark and mail it today. This doesn't obligate you in the least, and it will bring you information that will start you on a successful career. This is your chance. Don't let it slip by. Mark and mail this coupon *now*.

EXPERIMENTAL PHYSICS.

(*Continued from page 806*)

near the electroscope, we find that the electroscope discharges rapidly. The Bunsen flame ionizes the air very rapidly. A small quantity of radio-active material will discharge the electroscope very rapidly, showing that *radio-active materials have the ability to IONIZE the air.* The larger the amount of radio-active material the faster the rate of discharge of the electroscope. A pinch of Uranium Oxid in the electroscope chamber, will ionize the air so rapidly that the leaf will fall practically instantaneously!

Experiment 113.

A third test for the presence of most radio-active substances is the *"Fluorescence Effect"*—which some of them have upon certain compounds, especially *Zinc Sulfid.* Any of the substances which give off alpha radiations (see figure 102) will cause a zinc sulfid screen to fluoresce. If the screen is observed thru a sufficiently high power magnifying lens, or microscope (say ten or fifteen diameters magnification), the continuous soft glow of the zinc sulfid seen by the naked eye becomes, on magnification, hundreds of tiny flashes of light, not unlike the sparks obtained by striking flint and steel together. Figure 101 shows the *Spinthariscope*, which can be easily made by the reader. A is small metal tube with a hole, S, in its cap. E and F are lenses. C is the fluorescent screen on the cap of tube B. D is a small particle of the radio-active substance. A practical use of the fluorescent effect of alpha particles is familiar to all of us in the *radium paints, luminous dials*, et cetera. These compounds consist of specially prepared zinc sulfid, mixed with about 2,000 parts of radium bromid, or a radio-active compound having an equivalent of alpha-ray activity. Altho the period of half decay of radium itself is approximately 2,000 years, see table 102, the luminosity of the compound falls off, due to the fact that the *zinc sulfid loses its power to luminesce*, but not because the radium gives out. Some specifications for luminous paint, as for government work, stipulate that the zinc sulfid and radio-active substance shall be mixed in such proportions that the average useful life of the paint will be from 8 to 10 years.

The discovery of radio-activity has given us a vast field for research and as a result the physicist has been able to make subatomic investigations. Atoms are constantly exploding and shoot out as fragments, the alpha and beta particles. Altho the energy liberated by these explosions is fairly large, no diminution in the weight of the radio-active substance has been detected after the liberation of the energy. J. J. Thomson computed that the disintegration of one gram of hydrogen would liberate sufficient energy to raise a million tons 300 feet. See Fig. 103. If only this energy could be trapt, and recent research shows the possibility of it, Garfield and his coal-house gang would lose their job, for who would use ten tons of coal when one gram of hydrogen would give an equivalent heating value. Table 102 gives interesting data concerning the radio-active substances. In each series the first substance gives the second on disintegration and the second the third, etc. The second column gives the kind of radiation given off by the respective substances and the last column tells how long it takes for the substance to disintegrate to half of the original amount. This half-period means that after 2,000 years, for instance, one-half of the substance in question will have disintegrated. After 4,000 years, one-half of the remainder will have disintegrated or disappeared, etc., etc. The total life of pure Radium is computed from this law to be about 22,000 years.

(*To be continued*)

HISTORIC ELECTRIC SWITCHBOARD AND DYNAMO.

(*Continued from page 778*)

field magnet type with surface wound armatures. There are quite a number of these generators still in existence in various parts of the country, and in tribute to their designer, it should be said that they perform their duty very well indeed, considering the time at which they were built, for thirty to thirty-five years in the electrical industry has, we might almost say, witnest the entire development of the whole scheme of electrical generation, transmission and utilization of power, under the directorship of such men as Edison, Thomson, Houston, Tesla, Westinghouse and Sprague.

The wooden switch-board, shown in the photograph, contains four box-type field rheostats, and it is peculiar to note that they are mounted on the face of the board instead of in the rear, as in present day practise.—*Photo by Richard Nelson.*

THE TESLA EGG OF COLUMBUS.

(*Continued from page 775*)

Tesla had other surprises for his audiences, which were even more wonderful. So, for instance, the coil on three legs, visible in the foreground, was used to operate wireless motors, lamps and other devices, and the spiral coil in the background served to show extraordinary high potential phenomena, as streamers of great length.

ULTRAVIOLET ENERGY AND ITS USE.

By M. Luckiesh, Physicist, Nela Research Laboratory.

Since the discovery of ultraviolet rays, more than a century ago, their production and properties have been subjected to a great deal of investigation. However, notwithstanding the extensive literature on the subject we must agree with Sheppard, who says in his book on Photo-chemistry:

"We are only at the beginning of the conscious utilization of the powers of light, as distinct from the unconscious enjoyment of them."

Owing to the many unique properties of these invisible rays, they are extremely valuable in certain scientific investigations, tests, and industrial processes, and it appears certain, that with the progress of the development of sources of ultraviolet rays, and of media transparent to them, the usefulness of ultraviolet energy will be rapidly extended. The problems in which these unique properties may be utilized are manifold.

As to Sources:—There are many sources of ultraviolet energy, but few are powerful enough to be widely useful. The ideal source, which emits a continuous nonbanded spectrum of high intensity thruout the entire ultraviolet region, does not exist. Some of the sources are here ranked in order: magnetite arc, old mercury arc, new mercury arc, and carbon arc.

The blue flame arc emits ultraviolet energy very strongly. It is a simple matter to construct an arc which will emit ultraviolet energy strongly, provided hand-control is satisfactory. An iron rod and a carbon rod may be employed successfully for the two poles, however two iron rods may answer the purpose very well. These poles may be kept cool effectively by means of heavy brass or copper sleeves, which may be wound along the iron rods as the latter are consumed.

Uses of Ultraviolet Rays:—Ionization of air; powerful bactericidal agent; kill germs in water; effect upon animal tissue to bronze the skin. In industrial processes such as acetylene and arc welding, which are attended by powerful ultraviolet energy, there is a demand for eye-protecting glasses.

EVIDENCE OF ITS MERIT

F. G. Cooper, famous Cartoonist of Collier's, writes: "Within a few days after receiving your set of lessons I made all the notes in my pocket note-book in Paragon Shorthand. I had no previous knowledge of any shorthand. Weeks afterward I can read my Paragon notes. It strikes me that this is quite a recommendation for your system."

SECRETARY

"Paragon Shorthand is highly satisfactory in every way. I can read my writing readily, and I write the system with perfect ease as fast as one usually talks. Only two months after I learned the first lesson I was able to write 150 words a minute."

(Miss) Dolly Sparks
Stens. to Secretary of State of Florida

WITH UNCLE SAM

"It took me one week to master Paragon. My speed in 1 month was 80 words per minute."

Bruno Bonquis, 1330 F St., N. W., Washington, D. C.

WITH RAILROAD

"While employed on the local street railway lines as conductor, with exceptionally long hours, I managed to find an hour or two each day to study Paragon Shorthand, from the lessons alone and without the aid of any teacher. At the end of two months I was writing 155 words a minute on new matter and obtained a position. I am with the above railroad company at a nice salary. Paragon is very rapid, practical and easy to read after it is written."

Harold W. Hively,
1525 Ottawa Street,
South Bend, Ind.

STENOGRAPHERS

"My sister and I learned Paragon Shorthand from the lessons alone, without any teacher. She is now stenographer to the Kuhn Irrigated Land Company, and I am with the Westinghouse Co."

(Mrs.) Clara Trick Willson,
Pittsburgh, Pa.

HON. EUGENE B. ESTES
Boston, Mass.

"From your lessons alone—the home study course—I learned the entire Paragon System of shorthand in seven days. Any person of common education can master the Paragon System and by practice acquire speed. Paragon is ahead of any other system I have ever seen."

IN HIGH SCHOOL

"I received your Paragon Shorthand Course and have mastered it all in the time you said I could, just the evenings of seven days, and the evenings were not very long as we were interesting all the time. I think it is the only thing and will recommend it to other High School Students and also friends."

Milo F. Dean,
Fairview, Mont.

Paragon is also being taught in the High Schools of Alton, Ill., Lafayette, Ind., Johnstown, Pa., Atlanta, Ga., and elsewhere.

COURT REPORTING

"I have been the Official Court Reporter for the Ninth Judicial District of Louisiana for a number of years using Paragon Shorthand exclusively. Some years ago I learned this system in seven lessons. With Paragon Shorthand I am able to do any kind of work with as great rapidity as the occasion may demand."

J. Martian Hamley
Lake Providence, La

Learn Paragon Shorthand in 7 Days

Send No Money—Just The Coupon

Sent on 7 Days FREE TRIAL

Positively at No Obligation to Yourself

You know how often you have wished that you could write shorthand. You realized what it meant to busy executives and to business beginners—in efficiency, advancement and increased earning power.

But like thousands of others you dreaded the long, weary months of study, the memory tax, the mental strain and the high cost, in time and money, of the old systems.

Now you can have your wish. Because, all that you dreaded is done away with in the Paragon Method of Shorthand. Instead of committing to memory something like 4000 word-signs and contractions, which in other systems largely depend for their meaning upon the position they occupy, you have only 26 word-signs to learn in Paragon. The entire system consists of

The Paragon Alphabet: **Six prefix contractions:**
Twenty-six simple word-signs: **One general rule for abbreviations.**

THAT IS ALL. The simple explanations and exercises are divided into seven lessons, the principles of which one can grasp in one evening. Speed will develop pleasantly as you make daily use of your quickly acquired knowledge.

This is the Paragon System. Thousands have learned the 7 lessons in 7 evenings. See for yourself how perfectly simple it is. Stop right here and study the specimen lesson shown above at the right.

Now you see how easy it must be to learn Paragon and how quickly one can equip himself with this great modern instrument of Efficiency.

Everybody Can Use Shorthand

Our records show that in addition to the thousands of young men and women who need shorthand as a help in their business careers, other thousands—business men, professional men, students, clergymen and literary folk—would like to know Paragon Shorthand as a time saving convenience. Still others—fathers and mothers—would like to give their sons and daughters this wonderful advantage in order that they may be able to be self-supporting any time it may be necessary.

Many of these persons who have not a direct need for shorthand but want it as an instrument of efficiency and a daily time saver would buy the complete course of Paragon Shorthand at a popular selling price.

A Valuable Accomplishment Quickly Learned

Thousands of young, ambitious men and women who have failed to learn the old, complicated forms of shorthand have learned Paragon with ease. They have since become court stenographers, reporters, assistants to business heads and in many cases executives of prominent concerns and institutions. Thousands of grateful letters now in our files attest these facts. Those printed at the left are typical.

MORE EVIDENCE OF ITS MERIT

J. A. Wm. Wiersig, Principal of Luth. Evang. School, Brighton, Col., writes:

"Your system is, indeed, a short and simple one. I mastered it in less than five hours. I am now ready to practice for speed. Your system certainly deserves being advertised, and I shall certainly do my share when opportunity offers."

Try This Lesson Now

Take the ordinary longhand letter *d*. Eliminate everything but the long downstroke and there will remain /. This is the Paragon symbol for D. It is always written downward.

From the longhand letter *e* rub out everything except the upper part—the circle—and you will have the Paragon E o

Write this circle at the beginning of / and you will have Ed /

By letting the circle remain open it will be a hook, and this hook stands for A. Thus / will be Ad. Add another A at the end thus / and you will have a girl's name, Ada.

From *o* eliminate the initial and final strokes and O will remain which is the Paragon symbol for O.

For the longhand *m* which is made of 7 strokes, you use this one horizontal stroke —

Therefore, —o would be Me.

Now continue the E across the M, so as to add D—thus / and you will have Med. Now add the large circle O and you will have / (medo), which is meadow, with the silent A and W omitted.

You now have 5 of the characters. There are only 26 in all. Then you memorize 26 simple word signs, 6 prefix contractions and one general rule for abbreviations. That is all.

Paragon is Used Everywhere

Paragon is used in the offices of the largest firms and corporations in the world such as Standard Oil Company, United States Steel Corporation and the great Railway Systems.

You have reached the point where you must know shorthand to do yourself justice and compete with others—as a busy executive or as a beginner in business.

You know how it is. Two good men apply for a position—one knows shorthand and the other does not—the shorthand man wins every time. And the same applies to young women.

Remember how many of the biggest men in America got their start because they could write shorthand—Frank A. Vanderlip, George B. Cortelyou, William Loeb, Jr., Edward Bok and other men of highest achievement.

Shorthand Writers Wanted

Never before has American business felt so keenly the shortage of capable shorthand writers. Big business houses are looking everywhere for shorthand writers and are ready to pay any salary within reason to get the service they must have. Salaries are steadily advancing—and yet the demand for shorthand writers has not been supplied.

Only $5 If You Keep It

Think of it. For $5 you can have a complete education in shorthand, a life-long help—not only for yourself but for your wife or children or any other relative.

You can have exactly the same course that has been taught for 25 years by its inventor personally by mail at the regular fee of $25. With 7 lessons and the ingenious self-examination method devised by the inventor you can learn Paragon at home in seven evenings.

Send No Money—Try It FREE

Try it at our expense first. Simply fill out the coupon below and mail it to us. After you receive the Course, study it for 7 evenings, and if you believe you can be without this valuable knowledge any longer, mail it back to us and you will owe nothing. Send in the coupon or write a letter today.

Paragon Institute, Home Study Department, 601 Broad Street, Suite 350, Newark, N. J.

PARAGON INSTITUTE, HOME STUDY DEPARTMENT
601 Broad Street, Suite 350, Newark, N. J.

You may send me the Complete Course of PARAGON Shorthand with the distinct understanding that I have 7 days after its receipt to either remail the Course to you or send you $5.00.

Tobacco Habit BANISHED in 48 to 72 Hours

No craving for tobacco in any form when you begin taking Tobacco Redeemer. Don't try to quit the tobacco habit unaided. It's a losing fight against heavy odds and means a serious shock to the nervous system. Let the tobacco habit quit YOU. It will quit you, if you will just take Tobacco Redeemer, according to directions for two or three days. It is a most marvelously quick and thoroughly reliable remedy for the tobacco habit.

Not a Substitute

Tobacco Redeemer contains no habit-forming drugs of any kind. It is in no sense a substitute for tobacco. After finishing the treatment you have absolutely no desire to use tobacco again or to continue the use of the remedy. It makes not a particle of difference how long you have been using tobacco, how much you use or in what form you use it—whether you smoke cigars, cigarettes, pipe, chew plug or fine cut or use snuff, Tobacco Redeemer will positively banish every trace of desire in from 48 to 72 hours. This we absolutely guarantee in every case or money refunded.

Write today for our free booklet showing the deadly effect of tobacco upon the human system and positive proof that Tobacco Redeemer will quickly free you of the habit.

SORTING TOBACCO LEAVES BY ELECTRICITY.

(*Continued from page 770*)

duplicate of the first section, except that here a permanent stop is provided in the path of movement, which will prevent any leaf from returning to the starting point, but deposit it in the box provided for the longest leaves.

All boxes, ten at each side of the machine, are standing on a kind of steps, so that each one is, according to the incline of the covers, a little below the foregoing one. As the other side of the machine is but a duplicate, the device being a double action machine, there are ten boxes for ten different sizes of leaves at each side, or 20 boxes altogether.

The contact segments on the table are movable, and the machine can thus be so finely adjusted that it will not only measure and sort the leaves by *inches* as required, but even up to a *quarter of an inch* if so desired. The machine is driven by an electric motor, arranged below the table and not visible in the illustration, and by means of an electric regulator the speed of the machine can be regulated to meet the speed with which an operator is able to place leaves upon the feeding belt.

33 ASSEMBLED LOCOMOTIVES ON ONE SHIP.

(*Continued from page 765*)

expert locomotive engineers for assembling and it took the better part of a week before even one engine was complete. The locomotives had to be in complete running order here in the shops, as well as having all the parts of the machine carefully marked before being disassembled on this side of the pond. All this entailed many days of extra and unnecessary work—especially when time was at a premium. Those and many other delays occurred so that at one time there were thirteen ships loaded with *knocked down* locomotives in ports in France waiting for the discharge of their cargoes.

This was the situation confronting the Shipping Control Committee on January, 1918. The locomotive problem was immediately discust in detail to see if there was not some way by which the complete locomotives could be sent across the ocean intact.

The steamships Feltore, Cubore, and Santore, each 468 feet long, with three great holds and five hatches, the smallest of which was 33 feet by 37 feet and the largest 39 feet by 37 feet, were then prest into service. Each ship had a cargo capacity of 11,000 tons and was fitted with electric turbines capable of driving the ship at a speed of ten knots.

On May first loading started, and the holds of the steamer Feltore were floored off with five layers of railroad rails and splices to secure a firm foundation and also to protect the hull of the ship. Next day a railroad float came alongside with eight assembled locomotives ready for the trip.

The problem of lifting these great locomotives into the hold of the ship was solved by requisitioning one of the largest cranes in the world capable of lifting 150,500 pounds in bulk. The derrick captain took his stand on the deck of the steamer and by the use of electric signals directed every movement of the crane. And so without a single hitch, each and every one of these steel-bound monsters of the rails, was lowered and set on heavy oak planks; after which tons of compresst bales of hay and bags of oats were packed around them. And so seven days after the start of this great trip, there were on the wharves at Brest, France, 33 large assembled locomotives and tenders, 2,400 tons of rails and splices, 2,300 tons of hay, 600 tons of oats, and fifty-three motor trucks.

WOOD FINISHING FOR THE AMATEUR.

(*Continued from page 793*)

either of two ways, which are known among wood finishers as the "quick" and the "slow" methods of polishing.

The quick method is as follows: Dip a handful of raw cotton into a mixture of half peanut oil (refined cottonseed oil will do), and half alcohol, and rub the surface with a rotary motion, which will give a fine lustre in a short time.

The better of the two is the slow process. After the work has been brought to the dead finish mentioned above, put on an extra coat of finishing varnish, allow it to dry, and rub down again with FF pumice stone, cleaning up carefully. Then rub ground rotten stone over the surface with a soft chamois skin, using a circular motion, and when this is dry, rub it off with the palm of the hand.

There are several other kinds of polishing, notably wax polishing and oil polishing, which may be used if desired. In wax polishing the polish is put on at the same stage that the varnish would have been applied, using any method convenient to get the wax on the work. Perhaps the best way is to warm the wax and apply it with a brush, the same as varnish. This gives an even coat of wax, which is then polished with a hand cloth. There are a number of manufactured waxes on the market, any of which will give the desired results. The chief objection to wax polishing is that it mars very easily, but it is also renewed very easily, hence this is not such a serious objection for many kinds of work.

Oil polishing is the most durable of any, and therefore is often used for table tops, counters, etc. The process is very simple, but heartbreaking. It consists of applying either raw or boiled linseed oil upon the surface, and then rubbing it until a polish is secured. The polishing is done by means of a piece of felt wrapt around a heavy block, to give it weight.

This is about all that need be said about the various processes used in wood finishing, but a brief description of the various kinds of woods commonly used by the experimenter would not be out of place. A perusal of the list will often help determine the kind of wood required for any particular piece of work.

Birch.—Black birch takes on a fine polish, as it is close grained. Its natural color is light, so it is usually stained in imitation of black walnut or mahogany. Owing to its close grain, a filler is not absolutely necessary, but when staining this wood to imitate some other, a properly colored filler gives it a better coloration.

Cherry.—This wood is very close grained, and will take a high polish. It has little tendency to warp, and because of its close grain filling is not necessary, and shellacking will prepare it for any of the finest polishes.

Oak.—Oak is the "King of woods", and is very useful. It has a medium openness of grain, and *must always be filled before shellacking.* Almost any sort of polish may be used for finishing oak, one of the most beautiful being the "antique" method, a formula for which has already been given. The linseed oil polishing will also make an excellent and durable finish. There is but one objection to this wood for wireless apparatus, which has made it unjustly unpopular, and that is that the acid in the wood has a peculiar effect upon hard rubber panels.

Mahogany.—If expense were not an objection in most cases, mahogany would be an ideal wood for every purpose. It is coarse grained, requiring a filler, but is sus-

Let Us Tell You How To Make a Big Success in CHIROPRACTIC

Advanced Science of Spinal Adjustment

Mail the coupon below, right now—today—and let us tell you all about the remarkable opportunities there are for ambitious men and women in this great, new profession of Chiropractic.

You are, of course, aware that drugless healing is steadily advancing in public favor. Chiropractic has come to the front so rapidly during the past few years that it is today recognized as the most advanced, most scientific, and most successful of drugless healing methods. It is calling to its ranks men and women from every walk of life—and there is abundant evidence that they are making good in a big way in this new and uncrowded field.

Mail the coupon and we will send you full information—tell you how there is a splendid chance for you to build a successful career as a Doctor of Chiropractic.

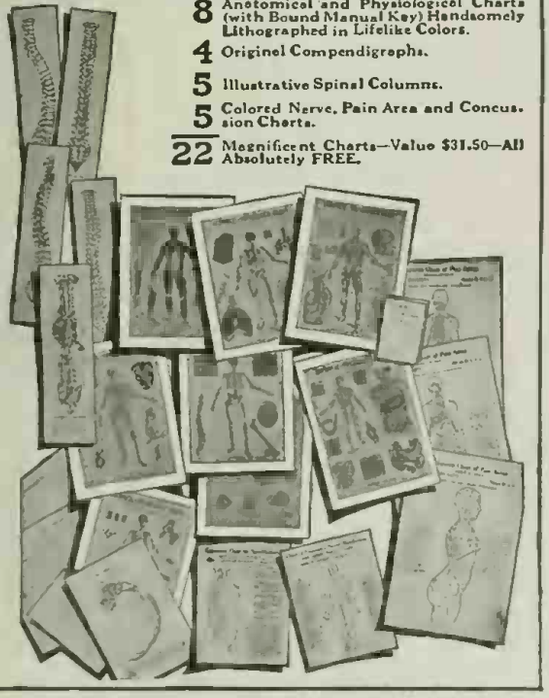
Learn At Home In Spare Time

The American University method of teaching Chiropractic enables you to study by mail or in class and obtain a complete education in the shortest time consistent with thoroughness, while you hold your present position. And you can pay on easy terms. A splendid faculty will personally instruct you in the basic principles and in the most approved methods for relieving Headache, Indigestion, Lumbago, Epilepsy, Pleurisy, Constipation, Rheumatism, Asthma, Neuralgia, Neuritis, Catarrh, Fevers, Jaundice, Dyspepsia, Paralysis, etc. No special preliminary study is needed. You will graduate with the degree of Doctor of Chiropractic, receive a handsome diploma and be ready at once to open your office.

$3,000 To $5,000 a Year

Remarkable Free Charts Offer

We want men and women seriously intending to take up professional careers in Drugless Healing to have these charts. Their actual value is $31.50. But on our offer they come free. There are 22 in all, printed in colors. Send the coupon below to get all the facts about our offer.



8 Anatomical and Physiological Charts (with Bound Manual Key) Handsomely Lithographed in Lifelike Colors.

4 Original Compendigraphs.

5 Illustrative Spinal Columns.

5 Colored Nerve, Pain Area and Concussion Charts.

22 Magnificent Charts—Value $31.50—All Absolutely FREE.

There are many instances of Chiropractors earning from $3,000 to $5,000 a year. Some upwards of $10,000 Dr. M. D. Moore, of Kentucky, reports an income of $9,000 a year. Dr. L. H. Roche, New Jersey, $5,000; Dr. Hanna, of Florida, over $5,000 yearly.

The success of Chiropractors in many cases has come so quickly as to be almost startling—almost like the accidental discovery of a gold mine. And yet, it is not to be wondered at when you consider the scientific accuracy of Chiropractic methods, the really remarkable results of a beneficial character in the treatment of both acute and chronic cases that have been affected through these methods, the rapid increase in the number of people who show a decided preference for Chiropractic over any other treatment for their bodily ills and the comparatively few Chiropractors that are now in the field.

Your Opportunity

If others have achieved such remarkable successes is there any reason why you should not do as well or even better?

Why not get out of the rut and qualify now for this splendid profession that offers such remarkable possibilities for making you prosperous and independent? No matter where you live, if you are ambitious to make money, increase your social standing and be a "somebody" in the world, our course in Chiropractic will point the way for the attainment of your ambition. Never has there been a more opportune time than now, for never has the demand for competent Doctors of Chiropractic been so great as it is today.

READ What These Doctors of Chiropractic Say:

"My Charges Are $25.00 for 13 Treatments"

American University:
My practice averages ten patients a day, of which many are women. My charges per course are $25 per 13 treatments. The number of treatments varies from one to two courses in stubborn cases. Minor cases take from 6 to 10 treatments. I have your school at heart and will boost it all I can.
DR. W. H. WEDELL, M. T. D., D. C.
N. Y.

Heartily Recommends Course Charges $2.00 per Treatment

American University:
I have no hesitation in recommending your course in Chiropractic to anyone contemplating such a course, as it is thoroughly practical, well-written, interesting and valuable to the new student and a valuable adjunct to any drugless healer. I receive $2 for all treatments.
DR. ANNIE B. McDERMOTT, N. J.

"I Am Proud of Your Chiropractic Course"

American University:
Our regular price for such work is $2. Treat on an average of about eight a day, and give all the way from 12 to 24 treatments, which depends on how obstinate the case is. Some are cured with only five or six treatments. I am proud of your Chiropractic course.
DR. W. H. WOOD, Missouri.

Price, Complete, $3.50

CORE WIRE

We have been fortunate in securing thru auction several tons of guaranteed pure, double annealed Norway Iron Core Wire and are selling this wire to "Experimenter" readers

AT PRE-WAR PRICES 20cts LB.

This wire is just the thing for spark coils, transformers, etc., and it is, of course, a very much more superior product than the usual iron wire. We absolutely guarantee the quality.

If you ever thought of building a spark coil, transformer, or similar apparatus, now is the chance to get the right material for it. As far as we know this is the only lot of Iron Norway Core Wire in the hands of any dealer at the present time, and none can be gotten until after the war.

We have only two sizes left:

26 INCHES 36 INCHES

Thickness about No. 21 B and S

If either of these sizes should be too long we advise cutting the wire down yourself by means of shears. It will pay you to do so as real Norway Iron Wire, sold by a few dealers last year, brought from 40c to 50c a pound. American core wire now sells for from 30c upwards per pound.

As long as the supply lasts we offer this wire as described above to our customers at the very low price of 20c a pound. Order at once.

ELECTRO IMPORTING CO., 231 Fulton St., N. Y. C.

Get your wireless stations

In Readiness Now.

Be prepared and avoid delay.

DUCK'S big 300 page Wireless and Electric Catalog is now, as it always has been, the largest and most complete and dependable Wireless Catalog published. Mailed for 12c in stamps or coin. Not sent otherwise.

Everything in wireless *worth while* is listed in this catalog. The experienced amateur will tell you to see our catalog before buying. You are thereby insured against an unwise purchase. It is the *Beacon Light* to guide you right in the selection of your wireless apparatus. No bigger or better values are obtainable elsewhere.

If you have our catalog No. 11, you have our latest catalog. Do not write for another. Send for a revised price list. It is yours for the asking.

THE WILLIAM B. DUCK CO., 230-232 Superior St., Toledo, Ohio

"NACL" Buzzer and Signaling Set

$5.50 Complete

Clapp-Eastham high frequency buzzer

A VERY COMPACT SET

Excellent for practice as key is correct height from table. Can be used for signalling by flashes over a long distance, also for a test buzzer or flash-light.

L. B. SALT, Van Brunt Ave., Dedham, Mass.

WOOD FINISHING FOR THE AMATEURS.

(*Continued from page* 810)

ceptible of a fine polish, which makes it much in demand.

Maple.—Hard maple is close grained and requires no filler, but soft maple is just the opposite and hence is of little value. It looks best in its natural color, very light, which is preferably obtained by the use of white shellac and the very whitest ivory varnish to be found. Hard maple takes the finest polish of any of the woods.

Black Walnut.—This is a dark-colored wood, rather open grained, requiring a filler to match its color, but no stain. One good coat of orange shellac will suffice to level its surface previous to polishing.

Pine, Poplar, etc.—These soft woods are open grained and easily worked. Having little beauty of their own they are usually stained, but we should remember that oil stains are the best to use, owing to the difficulty of getting an even coat. Shellac will do very well as a varnish for these soft woods, being applied on top of a liquid filler.

In conclusion it is to be hoped that anyone attempting to do wood finishing will do the wood justice and conscientiously perform all the operations required. Everyone has preferences as to the finish liked best, but after a study of the foregoing it should not be difficult to select the right one.

FORMER KAISER CONSTANTLY IN TOUCH WITH BERLIN.

The former Kaiser is believed to be constantly in communication with Germany. It is reported that a wireless station has been erected on top of Count von Bentinck's castle, and that German airplanes frequently fly over the estate, dropping messages.

SCIENCE IN SLANG

(*Continued from page* 799)

that it was the inherent what-you-may-call-it in the deceased animal and not the contact of the two dissimilar metals on the nerve and muscle, and the chemical action created thereof, that caused the amphibious corpse to do the post-mortem Hula.

"Even at that the Dago doctor opened up a lot of dope that the terrestrians were dead to, and laid another foundation rock for the next of the scientific gang to add to. And now we have galvanic current instead of homeric, as would be the case had the blind ditty writer pulled the stunt.

"Then Count Professor Allesandro Volta, B. S., enlightened himself with Couronne de Tasses (no, not demi-tasses) and piles, and condensing electroscopes, not to speak of the other heterogeneous paraphernalia that would make a Hebrew junk dealer itch in the palms. Well, Aleck stamped his cognomen in the pages of electrical history, as well as on fuse plugs and such other electrical stuff that has the potential inscribed on it.

"Here comes along André Marie Ampère and drops the aching public a string of facts tabulating a stack of laws governing the flow of the 'juice' and propounding with such effect that we now waltz into the store and order the fuses that we shot—or rather to replace the ones we shot—by the ampere (unless we buy them by the dozen).

"So it goes. Watt then bounces into the limelight and does his act and exit. Then, when they are sure he is dead, some favoring gink—generally a Prof.—names something after him. In this case it happened to be the great what-is-it. So, too, we get ohms and farads—see; Mike's handle was too long for laboratory use so the printers just stuck in the first half dozen characters and let it go at that. Likewise we amputated

www.americanradiohistory.com

the 'a' in Volta's name when we translated it into sure-enough language. You know we humans that have descended from the Angles and Saxons got a little more efficient and sawed off the sing-song trailers some time after Chaucer wrote 'Whyne that olde Aprille why the its shores sote' and sang it like a Swede, and say 'When the sweet showers of April' just like we say volt instead of volta.

"Since Bill Gilbert, way back in the fifteen hundreds, christened the phenomena that made amber famous 'Electricity' and dumped it onto the English-speaking people we have had names, terms, epithets, descriptions, designations, and appellations galore for its numerous manifestations; yet with all the wonders of the genii we are no nearer the solution of the something we call 'Juice'. We have a fair working knowledge of what it is *not*, and how it affects various substances — including *homos*.

"Jimmy Clerk Maxwell, the bonny 'Skoatchmahn' (accent on the first syllable), let loose with a gob of new stuff that have been pacemakers for a raft of scientific birds to follow up on. Jim's dope on the gas and light—while not the kind that affect the meter men—have apparently been agreed to in the main—even since he gave the proverbial bucket the fatal rap, and can't argue back at us.

"Naturally, as time ticks off, some wise guy, who has the advantage of the ones before by being behind, springs new stuff now and then.

"The Swedish Prof. who is almost guilty for the electron theory of matter, does not blankly contradict the dope now out on molecules and atoms and ions. The latest is only a new sprout on the tree of knowledge.

"Of course Madame Curie, when she got to meddling with pitchblende, nearly uprooted the chemical tree of knowledge with her 'Radium'. Naturally, as new dope shows up, we have to show the door to a lot of the old stuff, but when some guy slips us something from observation it turns out to be almost right in its percentage. The next guy looks a little farther and hands us a little more of the same thing, generally.

"Old Ben Franklin got the fluid idea—a lot of it right. Then as a little more of eternity reels off, converting the present into the past, the 'fluid' idea went 'fluey', and we conceived the phenomena as a vibration, of molecules, atoms, ions, and finally electrons. Some of the wise guineas have the vibrations all mapt out as colliding, circling, and vari-speeded particles of *almost nothing*, making up everything we are acquainted with and a lot that we are not. The only difference between the skull of your dome and the macadam on the road in front of your house is the difference in speed or direction or path. You don't need to take that as an insult—I could have used my own head for example, but my modesty forbids.

"As we sit over an electric heater we have to hand it to old man Joule. And after we are run over gracelessly by one of those 'noiseless electrics' we may be excused for giving Mike Faraday the verbal journey to Dante's pleasure resort for a delightless season of eternity, for it was old Mike that made the first electric motor mote. This old boy had a lot to do with induced currents, and from his inductions and deductions that transformer out on yonder pole was made a pot instead of an engine boiler or crowbar.

"Of course we'll not pass old boy Nick Tesla up—the 'high frequency kid'. His alternating current stuff and three phase dope—remember that trash the engineers howled 'It can't be done' at? Funny tho—our best motors are the three phase kind now.

"When alternating current flops down the

Learn Public Speaking

10 LESSONS FREE

Write — quick — for particulars of this extraordinary offer; an opportunity you will never forget if you take advantage of it. Ten lessons in effective public speaking absolutely FREE to those who act promptly, to introduce our course in localities where it is not already known.

We teach you by mail to become a powerful and convincing speaker—to influence and dominate the decisions of one man or an audience of a thousand. We have trained hundreds and helped them to increase their earnings and their popularity. Learn, in your spare time at home, how to overcome "stage fright" and conquer fear of others; how to enlarge your vocabulary; how to develop self-confidence and the qualities of leadership; how to RULE others by the power of your speech alone; how to train your memory. Our

WHAT THE COURSE TEACHES YOU.

How to talk before your club or lodge;

CUT YOUR OWN HAIR

If you can COMB your hair, you can CUT your own hair with this marvelous invention. You can cut your hair any length you desire, short or long, and finish the job as nicely as any barber in one-fourth the time before your own mirror, with the

UTILITY Hair Cutter

You can keep your hair well trimmed for a lifetime with this marvelous invention for actually **less than any good barber would charge you for a single hair cut.** Very easy to manipulate. Use it just like a comb, pushing it through the hair, downward, in the direction the hair lays. It is impossible to leave any "nicks" or "cat steps" in your hair, as there is a special Guard that guides the cutter blade evenly over the scalp.

35c POSTPAID

Extra Blades: 5cts. Each 50c the Doz.

Cut Children's Hair

at home and save time, trouble and expense of taking them to the barber shop. It works so easily and the job is done so quickly that the children enjoy having their hair cut. The adjustment feature, whereby the blade can be set to cut the hair to any desired length—short, medium, or long—makes it possible to do as perfect work as the barber, not to mention the tremendous saving.

As a Safety Razor You can use the Utility Trimmer as an ordinary Safety Razor, and it will give you as good a shave as the most expensive Razor you can buy You can shave the face or neck, or finish around the temples.

EASY TO HONE AND STROP BLADES

No trouble at all to keep the blades sharp. Just reverse the blade in the holder and proceed to strop as with an ordinary razor Extra Blades are always obtainable and cost only 5 cents each, or 50 cents the dozen.

USEFUL FOR MANY OTHER PURPOSES

There are many other uses for the Utility Cutter that will suggest themselves to you. Ladies use it for removing hair from under the arms and elsewhere. It is perfectly safe, and cannot cut the skin. One customer wrote us that he found it just the thing for cutting corns, while housewives and dressmakers say there is nothing better for ripping seams and making buttonholes.

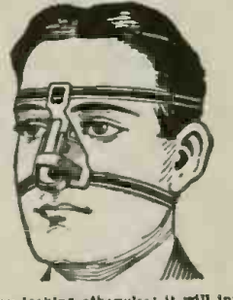
AGENTS AND DEALERS GET OUR PROPOSITION

This is one of the rare occasions when you are able to connect up with a really "Sell on Sight" article. Something that every man and woman will buy on sight, because it actually saves them money. Agents are coining money Why not you? Handsome package, weighs but a trifle. Write at once for terms on the Trimmers and extra Blades.

JOHNSON SMITH & COMPANY
Dept. RK 54 W. Lake Street CHICAGO

YOU HAVE A BEAUTIFUL FACE

BUT YOUR NOSE?



BEFORE

AFTER

IN THIS DAY AND AGE attention to your appearance is an absolute necessity if you expect to make the most out of life. Not only should you wish to appear as attractive as possible, for your own self-satisfaction, which is alone well worth your efforts, but you will find the world in general judging you greatly, if not wholly, by your "looks," therefore it pays to "look your best" at all times.

Permit no one to see you looking otherwise: it will injure your welfare! Upon the impression you constantly make rests the failure or success of your life. Which is to be your ultimate destiny? My new *Nose-Shaper*, "TRADE" (Model 24) corrects now ill-shaped noses without operation, quickly, safely and permanently. Is pleasant and does not interfere with one's daily occupation, being worn at night.

Write today for free booklet, which tells you how to correct ill-shaped noses without cost if not satisfactory

M. TRILETY, Face Specialist **1038 Ackerman Bldg., Binghamton, N. Y.**

Save Auto Repair Bills

Every car-owner should learn how to avoid *engine and all other auto troubles* and how to cure them by reading the *"Trouble Department"* of the AUTOMOBILE DEALER AND REPAIRER, a 100-page illustrated magazine, and the only journal in the world especially devoted to the practical and mechanical side of motoring. Our EXPERT SERVICE Department is free to all subscribers. You can ask questions and get answers promptly about any difficulty with your car. One article in one number was worth $25 to one car-owner. Send 25 cents in stamps or silver for three months' trial subscription to MOTOR VEHICLE PUBLISHING COMPANY, 735 Murray Street, New York.

line, along comes a lot of other by-product stuff. A load of new hypothetics and another load of theories to explain them. You know when you hook up some plants in parallel that there enters into the circuit a condition known as 'harmonics' that juggles the peak around and cuts it off, and goes negative when the generators are trying to make a positive impression on the line. Alternating current is great stuff and the guy that can get reactance and impedance kicking right and pull the wattless current off the line don't need to worry about such prosaic things as room rent and meal tickets.

"Steinmetz has this alternating current stuff pretty well under his hat and can tell you just what will happen, and when and why. If you ask 'Steiny' how he figures it he will tell you with a paper and pencil—if he did not do it in his head; but when the figures run into ten or more columns he generally reaches for his pencil. With his calculus he calculates the two-stepping oscillatory currents correctly thru his heavy cigar smoke.

"Surely we all know what Tommy Edison has done to us in the line of sidewalks and phonographs, in stock tickers and electric lights, in street railways and chemistry. That old duck works overtime seven days to the week and sleeps with his hat and shoes on, with a copy of Clerk Maxwell's dictionary for a pillow. Yes, Tom is a bright boy.

"To-day, after all the headlights and sidelights on history, we know more about, and less of, the so-called 'electric' force that causes our incandescent globes to glow and the amber to attract pith balls than our progenitors who wore fig leaves and bedspreads.

"Perhaps some day a man—maybe a woman—will come along and kick the mud out from the electrical puddle and let us see what a 'watt' really is. At least we will find more things that the mysterious force is the cause of. We may add to our frictional, static, dynamic and other present forms we have so far classified yet more. High frequency may be the way to it—it may not. We realize that we merely collect or cause to flow in our set paths the 'juice' we use, we do not create it. In a way we are unbelievably crude in our field of electricity. A lot escapes us, a lot leaks, as it were, and we get the use of a very small amount for the work we put into it and get out. Yet it is the most, or one of the most efficient forms of energy that we now have at our disposal. Perhaps some one will stumble on to some other source than dynamos and batteries for our supply—it may be a sort of collector or etheric accumulator. Thru electricity we may overcome gravitation. The conditions that would make possible are unlimited. Of course, that is supposition, but 'wireless' and the World War were all suppositions a few years ago.

"Speaking of wireless, Hertz looked over our heads and saw something we had overlooked since Galvani's 'return shock' on the frog's hind kicks. Then Marconi and others, notably De Forest, boosted the proposition along, so that now, with the audion amplifier, we transmit music, both chin and instrumental, for miles and miles on thin ether. Whether next we will transmit or merely collect energy for power I don't know, but I would not be surprised at either.

"Some scientists tell us that once our present planet was a whirling mass of nebulae. Later it concentrated into a rough globular mass. This was known as the Azoic Age. At this time its minerals and water were thrown off at a great distance in a gaseous state. As these cooled they formed rings or films surrounding the earth. Later these rings descended upon the earth, periodically. Thus the earth past thru the Paleazoic and Carboniferous

www.americanradiohistory.com

epochs, after which fell the remaining mineral rings, and animal life came into evidence. Then the last canopy, of hundred per cent. proof water descended, and we had the big washout known as the 'flood', where a man by the name Noah—who was *his* press-agent?—made his big hit with the historians.

"Now these science hypotheticians tell us that there is yet another ring, an electrical canopy, that, when it descends will destroy all microbes and other infamous micro-organisms—Mr. Flu included in the first row. Taking that into consideration we would be a healthier flock of mortals—but fermentation is caused by our minute friend-enemies; and no fermentation means natural prohibition. How would you like that? Besides upsetting the brewers and bakers and what else not including bacchic celebrations, it would probably upset our present electrical system, and likewise rules and laws. That is the Valian theory of the thing, and there are whole reams of other dope by other thinkers and numbskulls, but this Valian hunch hits me as plausible, and a lot of the other ding-dongs sound to me as if the author had had one too many under his belt.

"If the ring were to tumble—we would be in the same fix with the antediluvians as to the liquor question. The great liquor question would no longer be 'What drink will you have?' but 'When will the ring rise again?'

"By the way, I have a quart in my room," Stokes hinted as we arose to leave, "And you can never tell when that ring may fall."

AN AMPHIBIAN LAND, WATER AND AIR HYDROPLANE.

(*Continued from page 773*)

ranged along the center line of the superstructure on the exterior are a plurality of planes, which are maintained in the proper position by means of guy rods. Horizontal rudders are arranged in opposite pairs, each consisting of a series of blades mounted upon central shafts. All of the rudders and propellers are controllable by the aviator from within the cab, and by actuating the various rudder and plane controls, it is thus possible for the operator to cause the craft to fly on a level keel, or to turn at any desired angle, either upward or downward.

This amphibious airship is caused to fly thru the air by means of a pair of powerful propeller blades disposed on opposite sides of the gas bag frame as shown, and at the center of the ballonet superstructure. These propeller blades are driven by the motor situated within the car by means of bevel gears. Coney Island and the rest of the amusement parks threaten to take all of our spare nickels and dimes this summer, with such irresistible and fascinating diversions as this before us.

CONCRETE WIRELESS MAST IN CHINA.

A mast of concrete 150 feet above the wall of the Tartar City, near Chienman, has been erected for the United States naval wireless. The column is 18 inches in diameter at the base and 12 inches at the top. Its weight is approximately 30,000 pounds, and it includes 2,500 pounds of reinforcing steel and 160 cubic feet of concrete. Twelve guys, fastened to four anchor blocks, secure the mast. The work was completed in seven weeks.

HARVARD RADIO SCHOOL TO BE REMOVED.

The naval radio school in Cambridge, in which nearly 5,000 sailors are under instruction, is to be removed to the Great Lakes Naval Training Station by April 1.

How I Increased My Earnings From $2 to $200 a Day!

The Remarkable Story of a Young Man's Experience After Reading a Wonderful Book, as Told by Himself

SOME people say it takes money to make money—others complain that they never made money because they never had any luck. When one is up against the stern reality of making both ends meet, it is natural to feel that if they only had a little money, or a little luck, they wouldn't have to worry about their bread and butter, and rent, and clothes.

A short time ago I, too, felt that way. I was a bill clerk earning only $12 a week, and I used to worry myself sick about my future.

To-day—it seems like a dream—all my financial troubles are over—my weekly income instead is about $1,000—more than I know how to spend. I own two automobiles and have a chauffeur to drive me around. My children go to private schools. I have just purchased, for cash, a $25,000 home. I go hunting, fishing, motoring and traveling, whenever I care to. I live in a new kind of world.

Possible to Anyone

Let me say in all sincerity that what I have done, I believe any one can do. I am only an average man—not "brilliant"—have never gone to college—my education is limited. I know at least a hundred men who know more than I, who are better educated and better informed—yet not one of them has made as much money as I have, their earnings probably averaging less than $50 weekly. I mention this to show that earning capacity is not governed by the extent of a man's education—to encourage those who have not had the advantage of a comprehensive education.

What, then, is the secret of my success? Let me tell you how it came about.

How I Discovered Myself

One day, about three years ago, something happened that woke me up to what was wrong with me. It was necessary for me to make a decision on a matter which was of little consequence. I knew in my heart what was the right thing to do, but something held me back. I said one thing, then another; I decided one way, then another. I couldn't for the life of me make the decision I knew was right.

I lay awake most of that night thinking about the matter—not because it was of any great importance in itself, but because I was beginning to discover *what was wrong with me.* Along towards dawn I resolved to make an experiment. I decided to cultivate my will power, believing that if I did this I would not hesitate about making decisions—that when I had an idea I would have sufficient confidence in myself to "put it over"—that I would not be afraid of myself, of things or of others. I felt that if I could smash my ideas across I would soon make my presence felt. I knew that heretofore I had always begged for success—had always stood, hat in hand, depending on others to give me the things I desired. In short, I was controlled by the will of others. Henceforth, I determined to have a strong will of my own—*to demand and command what I wanted.*

With this new purpose in mind I applied myself to finding out something more about will power. Finally I encountered a book written by Professor Frank Channing Haddock. I was astonished to read his statement. "The will is just as susceptible of development as the muscles of the body!" It is almost needless to say that I at once began to practise the exercises formulated by Dr. Haddock, and I need not recount the extraordinary results that I obtained almost from the first day. I have already indicated the success that my developed power of will has made for me.

But it may be thought that my case is exceptional. Let me again assure you that I am but an average man, with no superdeveloped powers, save that of my own will. And to further prove my contention, let me say that since Prof. Haddock's lessons, rules and exercises have been published, I have come across hundreds of other cases where strengthened will power has brought success and fortune to people who were failures, has enabled thousands to overcome drink and other vices, almost overnight—has helped overcome sickness and nervousness, has transformed unhappy, envious, discontented people into dominating personalities filled with the joy of living.

What You Can Do

I have been authorzied by the publishers of Prof. Haddock's methods to say that any reader who cares to examine his startling book on will power may do so without sending any money in advance. In other words, if after a week's reading you do not feel that "Power of Will" is worth $3, the sum asked, return it and you will owe nothing. When you receive your copy for examination you will be interested in the studies on The law of great thinking; How to develop analytical power; How to guard against errors in thought; How to drive from the mind unwholesome thoughts; How to develop fearlessness; How to use the mind in sickness; How to acquire a dominating personality, and hundreds of other similar personal power studies.

It is interesting to note that among the 250,000 owners of "Power of Will" are such prominent men as Judge Ben B. Lindsey; Supreme Court Justice Parker; Wu Ting Fang, ex-U. S. Chinese Ambassador; Senator T. B. Calron; Gov. McKelvie of Nebraska; Assistant Postmaster-General Britt; General Manager Christeson, of Wells Fargo Express Co.; E. St. Elmo Lewis; Senator Arthur Capper of Kansas, and thousands of equal prominence.

As a first step in will training, I would suggest immediate action in this matter before you. Use the blank form below, or write a letter addressing it to the Pelton Publishing Company, 30F Wilcox Block, Meriden, Conn., and the book will come by return mail. This one act may mean the turning point of your life, as it has meant to me and to so many others.

FELTON PUBLISHING COMPANY,
30F Wilcox Block, Meriden, Conn.

I will examine a copy of "Power of Will" at your risk. I agree to remit $3 or remail the book in 5 days.

Announcement

The Moorhead Laboratories, the largest exclusive manufacturers of Vacuum Valves in the world, have been busily engaged during the war in supplying Vacuum Tubes to the British and United States Governments.

They will have manufactured and tested a large quantity of these Vacuum Bulbs to meet the requirements of the amateur and experimental trade as soon as the ban is lifted.

All these Valves are licensed under the

FLEMING PATENT

owned by the Marconi Company, and protected by several pending patents.

We are the distributing agents of the Moorhead Laboratories, and you can obtain from us the same high grade Detector, built to Government specifications and supplied to the above mentioned Governments as standard equipment.

We will give you the most prompt and satisfactory service that it is possible to render.

Send your name and address to us, and we will forward you an interesting booklet describing the Moorhead Valves and other Apparatus for both receiving and transmitting.

Yours for efficiency

Gigantic 1,400 K.W. Radio Station at Lyons, France

(*Continued from page 791*)

work, it having been found readily possible to synchronize two such high-speed radio-frequency alternators at the works of the General Electric Company, some years ago.

North of the main antenna switch platform at the center of the station, there is a French design of static frequency multiplying system rated at 150 K.W. This set operates on the principle of the transformer frequency-changing principle, as developed by Joly and Arco.

Next we come to the western wing of the station, and here there are two of the largest arc oscillation generators ever built. They were designed by Mr. C. F. Elwell, formerly chief engineer of the Federal Telegraph Company of San Francisco, Cal., who first developed the Poulsen arc system to large powers, and each of these gigantic arcs are rated at 250 K.W. Either of these arc generators may be connected to the antenna thru the central antenna switch-gear, the lead wire running to the arc sets terminating in a massive single-pole, double-throw change-over switch, about five feet in length, which permits the instant connection of either set to the antenna.

Either of these powerful arc sets can be operated from the 300-K.W., 750-volt, direct-current motor-generator set, shown in the plan view and situated just west of the arc apparatus itself. This motor-generator comprises a three-phase alternating-current motor, direct-connected to a 750-volt, direct-current, 300-K.W. generator, which supplies the necessary high voltage direct current for operating the arcs. Dr. de Forest states that in his opinion, these large arc generators represent one of the very finest developments in radio transmitters that have yet been conceived and perfected. They have a distinct advantage over radio frequency alternators in that quick changes in wave length or frequency can be rapidly obtained, merely by changing the inductance and capacity in the oscillatory circuits connected to the arc itself. The radio frequency alternator is very reliable, and develops its full power in a very constant and reliable manner, but it is difficult, at least with the present design of this machine, to obtain with speed and efficiency a considerable change in the range of wave lengths and frequency, yet as Dr. de Forest has intimated, they are very efficient and desirable where the proper operating conditions are available, such as where but one or two wave lengths only are desired. The arc generator, on the other hand, is very simple and rugged in design, and requires but very little attention, even when operated over twenty-four-hour non-stop periods, which is often the case nowadays at many of the Government stations which are using arc sets, and many of which are in very successful operation in some of the largest stations of the United States as well as in Europe at the present time.

All of the transmitters at the Lyons station operate on long wave lengths, as the reader will perceive from the antenna frequency values given above, and the undamped wave system is used in all except the spark sets. The receiving apparatus is very elaborate, and has been installed in sound-proof receiving rooms, so as to realize the very highest efficiency in the receipt of long distance signals. The French radio engineers are using nothing but three electrode audions in all of their work, and one of their bulbs will be illustrated and described in the April issue. The French receiving sets make use of two or more amplifier bulbs, and when necessary a six-stage amplifier is used, which boosts the strength of signal received 1,000,000 times. Some of the clever work accomplished by the French Army and Navy radio experts during the war, with these powerful audion amplifiers can readily be imagined, and it is a matter of record that many valuable radio as well as regular telephonic and telegraphic wire messages of the Germans were tapt by French stations equipt with these powerful amplifiers.

The power for the Lyons radio station is transmitted for a long distance from a hydro-electric plant. The receiving apparatus was built by the Compagnie Generale Radiotelegraphique, whose shops are near Paris. The detector is, of course, the French type of audion. They employ a six-step audion amplifier, using the same standard type of bulb both for detecting and amplifying.

The ground connection of the station consists of a large number of copper wires radiating from the station and buried about two meters (6½ feet) below the surface of the earth. Many of these wires terminate in copper plates.

HOW I INVENTED THE AUDION.

(*Continued from page 790*)

plication was not filed until the following February. The drawings, Figs. 2 and 6, of this patent show the incandescent or glow members both in the air, and sealed within a closed chamber.

It will be noted now that I approached the general problem of this new type of detector from an entirely different angle from that commonly supposed to-day. In the first place I always employed a battery, and this original battery was what is now universally called the "B battery." My source of electric current for heating purposes was second, and secondary, so that the vociferous contention of the advocates of the Fleming valve that the audion evolved from the Fleming valve, and was originally the Fleming valve with the "B battery" added as an afterthought, is entirely untrue.

It was now a very obvious development of the evolution thus far described, to partially exhaust the glass envelope containing the two incandescent electrodes, or filaments, so as to increase the conductivity of the space between them.

But Fig. 5 of this patent, showing the inclosed filament in a vacuum bulb, is interesting from another consideration because it contains the *first embryonic germ* of the later "grid" or *third electrode*. It was realized from the very first that a certain proportion of the high frequency energy from the antenna could be lost thru the bypath circuit supplied by the battery and telephone receiver. In order to prevent this the arrangement shown in Fig. 5 was tried out, wherein the local and high frequency circuits are kept separate. In this arrangement, as actually tried in the gas flame, no actual advantage was observed, because the high frequency electrodes were necessarily some slight distance from the path conducting the direct current, and hence the effect of the high frequency currents upon the ions carrying the local current was weakened.

During the years of 1904 and '05 my duties kept me almost continually away from my laboratory, in travelling about the country directing the installation of numerous radio stations; consequently there was little opportunity for prosecuting this development work, and carrying out the designs and sketches which I made from time to time. In fact, it was not until 1905 that a lamp manufacturer was found to undertake the construction of the various experimental forms of lamps which I had designed as a successor to the flame or arc detector. I was familiar in 1905 with Prof. Fleming's work on the subject of the "Edi-

Telephone Men Use These a WEEK FREE

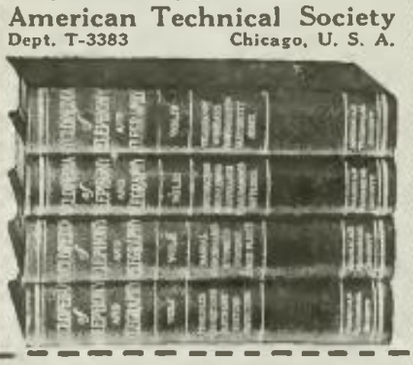
ACCEPT this **free** offer and use these great up-to-date books on the telephone in your own home or shop a whole week free.

We will send you all four volumes bound in genuine red morocco leather, 1728 pages and 2000 pictures, without one cent in advance.

Cyclopedia of TELEPHONY AND TELEGRAPHY

Everything about the telephone is explained in them in simple and plain language—theory—practice—operation—from the first experimental line to the modern equipment and complicated switchboards. Not one detail has been overlooked. Every vital fact that you need to make you an expert is in them.

Free Consulting Service



If you wish to keep the books on our easy terms of $2.00 a month, we will include FREE a year's Consulting Membership in the American Technical Society, and you can have the services of our engineers and experts for one year as often as you wish to write in—ask for their help on any subject within the scope of books.

Send the Coupon Now

Don't send any money. Just mail the coupon properly filled out and the books will come to you at once by express collect. Keep them a whole week and use them as if they were your own. Send them back to us if you want to, but give them a trial anyway, and if you keep them send us only $2.00. You can send the balance of the special $12.80 price the same way—$2.00 each month.

Give yourself a chance to make some real money—right now. Send the coupon before you turn this page.

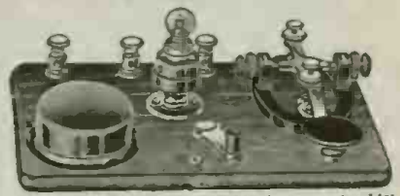
Mesco Telegraph Practice Set

For Learning Telegraph Codes



The Practice Set comprises a regular telegraph key, without circuit breaker, a special high pitch buzzer, one cell Red Seal Dry Battery, and four feet of green silk covered flexible cord.

The key and buzzer are mounted on a highly finished wood base, and three nickel plated binding posts are so connected that the set may be used for five different purposes.

List No.		Price
342	Telegraph Practice Set, with Battery and Cord	$3.24

Weighs 4 lbs. packed.
Price does not include postage.

MESCO Combination Practice Set for learning the Morse and Continental Visual and Audible Codes

This outfit is the only reliable instrument which will enable students to become proficient operators in the U. S. Naval Service, because it is equipped with a buzzer and miniature lamp enabling the user to master both the visual and audible signals quickly.

List No. 52—Practice Set with Red Seal Battery and Cord $4.05
Weighs 4 lbs. packed. Price does not include postage.

Send for the New Edition of Our Catalog W28

It is pocket size, contains 248 pages, with over 1,000 illustrations, and describes in plain, clear language all about Bells, Push Buttons, Batteries, Telephone and Telegraph Material, Electric Toys, Burglar and Fire Alarm Contrivances, Electric Call Bells, Electric Alarm Clocks, Medical Batteries, Motor Boat Horns, Electrically Heated Apparatus, Battery Connectors, Switches, Battery Gauges, Wireless Telegraph Instruments, Ignition Supplies, etc.

son Effect" as utilized for the rectification of high frequency oscillations, or currents. This was interesting to me only as an evidence of growing activity along lines similar to those of my new detector. I was familiar, of course, with the phenomena originally discovered by Edison, and investigated and developed by Howell, Fleming, Wehnelt, et al; but from the very first of my work with radio detectors I always had in mind a *relay*, in the true sense of the word, *not a rectifier;* in other words, a detector in which the energy of the audible signal was supplied from a local battery. This local energy being merely controlled or released by the incoming signal. It had always been obvious to me that such a device should be more efficient than any form of rectifier where the signal indication is effected *only* by the energy actually received thru the antenna.

Fig. 1, Patent No. 824,637, is an obviously practical development of Fig. 5 of my first patent, No. 979,275. In this figure two incandescent filaments are sealed in the glass bulb, and each lighted from its own "A" battery. Here, as always, the original separate "B" battery is shown.

This figure is interesting to many, who until recently, if even now, have never heard that an audion of this type works equally well whether both electrodes are incandescent, or whether one is incandescent and the other cold. It might be well to point out now in this connection that during the patent trial—the Fleming valve vs. the Audion—a demonstration was made before the court where all three electrodes were in the form of filaments, where each could be heated to incandescence by a separate battery. The demonstration showed that when this device was connected up as an audion that either outside filament could be used as the "plate" electrode indifferently, and the signals were of the same intensity whether two electrodes were cold or all three hot. The purpose of this test was to demonstrate beyond all cavil the falseness of the assumption that *rectification* plays in any way an important or essential part in the operation of the three electrode audion.

Fig. 3 of the above mentioned patent No. 824,637 shows the next obvious step in the evolution of the audion i.e., doing away with the unnecessary battery for heating one of the electrodes. It was obvious, of course, that so long as the "B" battery was properly connected so that its positive pole led to the cold electrode, there was no necessity or advantage in heating this second electrode. The audion in this form—one hot and one cold electrode, and the "B" battery connected with this positive terminal to the cold electrode, was used for some months, and shows a sensitiveness as a detector, superior to that of the electrolytic detector, and far superior to that of the Fleming valve rectifier. We had, thanks to the "B" battery which was invariably employed, a genuine *relay* or *trigger action* of the high frequency oscillations upon the normal current-carrying ions, or electrons, passing between the two electrodes.

As everyone familiar with incandescent lamp or X-ray bulb phenomena knows, the proportions of current passing between two electrodes therein (one or both being hot) carried by ions or carried by thermions, depends chiefly upon the degree of exhaustion of the bulb. The gradual preponderance of thermionic conduction over ionic conduction has been gradually increasing as the art has progrest with improvements in pumps, knowledge of the fine points of exhaustion, etc. Thus it has always been impossible to lay a finger upon a certain date or upon any audion type of device, and say, "This marks the distinction between an ionic, or gascous detector, and a thermionic detector." It is in fact impossible to prove even to-day when audions or oscillions are exhausted to the highest degree that the conductivity is *entirely electronic.*

Super-Sensitive Microphone ONLY $7.50

This instrument is offered at an extremely low price. It is excellent for building your own amplifier. Can also be used in many experiments where a sensitive microphone is required.

Detectagraph, $15

This detecting instrument of marvelous sensitivity can be used for detecting secret conversations. Outfit consists of Sensitive Transmitter, 25-ft. Black Cord, Receiver, Headband, Case and Battery.

Send for One Today and Convince Yourself.

Detectagraph $15

THE $15 MICROPHO DEAF-PHONE

is a super-sensitive instrument which has been developed to meet the demands for a practical and efficient hearing device at an extremely low price. It is equal to any $35 instrument made and superior to most of them. The outfit consists of One Super-Sensitive Transmitter with cord connector; One Super-Sensitive Ear Piece with small black cord; One Black Single Headband; Black Case and Two Batteries. In the spring and summer of 1906 I had opportunity to spend a good deal of time on the audion problem, and was always seeking to improve its efficiency. Keeping in mind then the disadvantage of directly connecting the high frequency circuit with the local circuits, and harking back to the four electrode gas-flame detector above mentioned, I sought to keep one electrode of the high frequency circuit distinct from the two electrodes of the local current. Obviously the most simple experiment was to *wrap a piece of tinfoil around the outside of the glass bulb and connect this to one end of the secondary transformer of my receiver.* The other end of the transformer was connected to the filament, it being obviously unnecessary to employ four electrodes to effect the end desired. Exactly this arrangement, with the third electrode around the outside of the bulb, is shown in Fig. 3 of patent No. 841,386, which was filed in August, 1906. It will probably be recalled that this outside electrode has been very recently "re-discovered" with considerable eclat and acclaim! I also at this time wrapt a coil of wire around the bulb, connecting one end of this to the antenna and the other to the ground, seeking thus to effect the ionic conductivity between the inner electrodes by electro-magnetic influence from the high frequency oscillations passing around this helix. See Fig. 4, patent No. 841,386.

The arrangement of the external tinfoil belt may therefore be called the *parent of the third electrode.* It showed a decided improvement in the sensitiveness of the detector, as I had anticipated. I recognized that by this arrangement I had in effect a condenser between the filament connection and a hypothetical third electrode, which consisted of the conducting layer of gas located on the interior walls of the bulb, the other arm of this condenser being the tinfoil belt outside the glass. I recognized also that this was a very inefficient and indirect way of impressing the effect of the high frequency oscillations upon the conducting medium between the filament and plate. The third electrode should therefore be placed inside the bulb. I immediately instructed McCandless & Company to make such a bulb. The first type of this third electrode was in the form of a plate, located on the opposite side of the filament from the "B" battery plate. This arrangement showed the increased efficiency and sensitiveness anticipated. It is shown in Figs. 2 and 4 of patent No. 841,387, filed October, 1906. This is the audion amplifier and telephone relay patent. Fig. 2 of this patent is interesting as showing also for the first time a third battery ("B") in the external circuit between the third electrode and the filament. T in this figure represents the high frequency transformer.

In Fig. 4, where this battery is omitted, is shown for the first time the grid stopping condenser C. In studying this type of three electrode bulb, I recognized that the third electrode was not yet in its most efficient position. It should be placed directly in the path of the ionic or thermionic stream, passing from filament to plate, where the high frequency electric charges imprest on the electrode could best affect this stream. But if placed directly between two electrodes, a solid plate, of course, would constitute practically a complete barrier. Hence I devised the *grid* or *perforated screen structure.* In fact, the first audion where the third electrode was placed between the filament and plate utilized the wire bent in grid form which is familiar to every amateur or user of the audion prior to 1914.

This type of third electrode so located was so marked an improvement over the preceding three-electrode bulb, that shortly thereafter a patent was applied for on it. This was issued in February, 1908, No. 879,532. See Fig. 1 where the complete receiving arrangement and the grid audion is clearly shown.

Brandes "Superior" Head Set, complete with head band, $6. A professional set within the means of every amateur. 2000 ohms.

BRANDES
Wireless Head Sets

Anticipate the demand that will set in as soon as the Government lifts its ban on amateur wireless stations.

Order your BRANDES WIRELESS HEAD SET TODAY.

Be ready for better wireless results than you ever had before. The *matched tone* of the two Brandes diaphrams make this possible.

Every Brandes head set is sold under a positive money-back guarantee that it is superior to any other receiver at its price in clearness, sensitiveness, and range.

Order a Brandes Head Set today—or send 4c for Booklet E with complete description of Brandes receivers.

C. BRANDES, Inc.

Wireless Receiver Specialists

Room 814 32 Union Square New York City

Complete line of Brandes receivers for those in Western States and Pacific Coast. Catalogue E on request.

Recharge your old dry Batteries

No Chemicals: Method Easy. Sent on receipt of 25c Coin. C. E. MILLER, 164 Riverside Drive, Northampton, Mass.

The audion remained in this form for six years. During that time its merits became gradually recognized in Europe as well as here, and it was not long before the little stranger was, like its predecessor, the two electrode brother with "B" battery, adopted into the Marconi family, and like its predecessor re-christened the "Fleming Valve." As soon as the audion amplifier had been developed for long distance telephone service by the engineers of the Western Electric Company, and installed on most of the long distance lines of the A. T. & T. Co., we find certain English publications adopting it also into the Fleming valve family; and now after the three-electrode device has demonstrated its utility as a radio transmitter of absolutely constant undamped waves and made possible trans-oceanic telephony, we learn that this big brother which I first named the Oscillion, is also the Fleming valve. Not even "junior" or "senior" is used to distinguish one from the other in this rapidly growing Fleming valve family.

The art founded on the three-electrode audion has grown of late years with enormous strides. The great war has produced a tremendous intensity of development for various military purposes and it cannot be disputed that the engineers of the Western Electric Company have taken a foremost position, and much of the present-day efficiency of the detector and amplifier has been due to their efforts, spurred on as they were by the difficult demands and specifications of our Signal Corps officers and engineers. It is estimated that there has been constructed for the U. S. Signal Corps during the war between 200,000 and 300,000 audion and amplifier bulbs, and at least 50,000 small oscillators. In Great Britain wartime production has probably equaled or exceeded the above; while in France we are informed that during the last two years of the war, the audion production has averaged about *5,000 per day!* The French bulb is particularly interesting as being efficient and suitable in all three uses, detector, amplifier and oscillator. For such purposes, of course, a compromise in efficiency was inevitable, and maximum efficiency in either of these three branches has been somewhat sacrificed.

Considerable discussion has lately arisen as to the first use of the audion as an oscillator or source of alternating current. This matter is now being thrashed out in a multiple interference procedure in the U. S. Patent Office. But the evidence so far indicates that the writer's application of this property of the audion in the spring of 1912, marked the first use of the audion as a generator of undamped electrical currents. In view of recent developments, particularly the highly interesting announcements of President Vail of the A. T. & T. Co., regarding multiplex wire telephony and telegraphy over a single conductor pair, it may be prophesied that the application of the audion as a generator of alternating currents will be fully as useful as that of detector and amplifier.

There is, in the writer's opinion, no doubt but that if the development of radio is not now made a Government monopoly, it will not be long before commercial trans-oceanic wireless telephony will be effected. This work, whether the generator be a bank of oscillions or a high frequency alternator, will be made possible only thru the extraordinary amplifying properties of the audion, when used as telephone repeater or relay.

The simplicity of the oscillion transmitter in small sizes, coupled with the extraordinary sensitiveness of the "zero beat" audion detector or amplifier of received high frequency energy, warrants the belief

LATEST STYLE IN FLASHLIGHTS.

(*Continued from page 767*)

the entire set of meter dials are instantaneously photographed on a film. When the meter-reader gets back to the office, the exposed roll film is removed from the camera and a new roll inserted. The film is then developed and the hills made out from the record photographed thereon.

Down on the farm we find another interesting use of the flashlight, tho Uncle Josh will swear that the old barn lantern is much better, and this is in the *testing of eggs* for fertility and freshness. Several attachments have been produced, or one can easily be made from a piece of cardboard, aluminum or tin, in the shape shown in the accompanying illustration, Fig. 7, so that a strong beam of light is thrown against the egg, as it is placed in the opening in the candling screen. In this connection it is interesting to note that by holding a flashlight bulb against the hand or against the finger that it is possible to locate foreign bodies in the finger. The illumination is very intense, and will act almost like an X-ray.

Figure eight shows a doctor's *head lamp* fitted up in an emergency or for regular use from a pocket flashlight. The battery is connected with a piece of flexible twin-cord to the lamp bulb, which is preferably mounted in a small receptacle secured to a piece of fiber, and which in turn is wired or sewed to a strip of elastic webbing. A small buckle can be secured to the free ends of the webbed band, so as to hold it in place on the head in any desired position. A polisht nickel reflector is held in place by the lamp when screwed into the socket, as indicated.

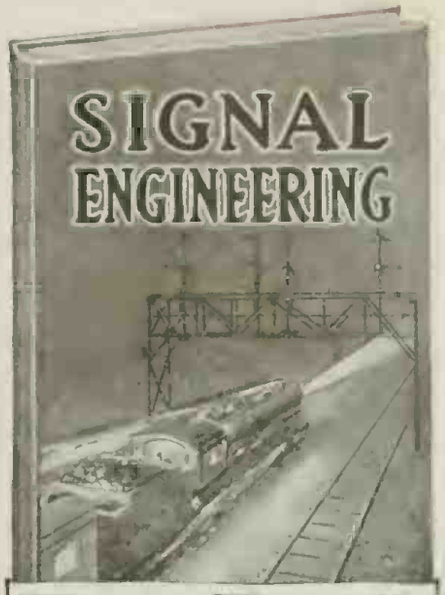
Another clever use for flashlights is in the form of a *desk signal*, and this scheme is outlined at Fig. 9. It has been tried out with great success in several offices. A diagram is given for a three-wire return call system. The beauty of the flashlight call system is that it does not give such a nervous shock to a person as the ordinary buzzer or bell, and it is also very simple and quick to install. Any one can install such a signal system in a few minutes' time. Ordinary bell wire or some flexible lamp cord is used for connecting the two stations together, and the internal connections made to the flashlight battery are clearly shown in the diagram. Where two or more flashlights are used on one desk, the lenses may be of different colors, so that the party calling is indicated more quickly.

Figure ten shows one form of *electric clocklight*. Of course, most ordinary mortals find the pocket flashlight very useful about the bedroom, and invariably keep one under their pillow, so that it is only necessary to flash it on the clock or watch and ascertain the time whenever desired, but in some instances it proves more convenient or desirable to have the lamp bulb mounted on the clock base as here shown. Those desiring to utilize this scheme can easily do so, and all that is necessary is the ordinary flashlight, the proper length of flexible twin-cord and a push-button, preferably of the pear-shaped variety.

Figure eleven illustrates one out of about ten thousand possibilities in electric flashlight advertising and tie-pin novelties. The illuminated "stove pipe" and shirt bosom shown, were not merely sketched by the artist, but were actually used for several years in New York City, and tickled the heart of many a youngster as well as grown-up. The man fitted with this illuminated silk hat and shirt bosom was quite a common figure on Broadway at one time, and created one of the most novel surprises progressive advertising ever initiated. Needless to say, the best results are obtained with such an arrangement when the lights are flashed on and off at short intervals. In the present case the hat became illuminated first and then the shirt bosom, the arrow in the front of the hat sign causing the onlooker to glance downward invariably, and at that psychological moment,— lo and behold! the shirt bosom blazed forth in all its red-and-white-striped-glory, to the effect that "Killem-quick's" whisky was the only stuff that had the "punch"—it did'nt say it was a deadly punch, to be sure.

The illustration at Fig. 12, shows a very ingenious and most useful instrument utilizing the flashlight principle and known as the *inspectoscope*. As the illustration shows, the inspectoscope comprises a tube either of fixt length, or else made telescopic, at the lower end of which there is a mirror placed at an angle of 45 degrees, while at the upper end of the tube a small flashlight case and its battery are mounted. The lamp at the bottom of the tube receives current thru the metal tube, and the other side of the circuit is completed thru a single insulated wire leading up to the flashlight battery, the button switch on the battery case being used to light the lamp. This instrument has been found extremely efficacious in reading name-plates on motors and other machinery where they happen to be in inaccessible locations, such as close to a wall, etc. Many other practical and ingenious uses of the flashlight will suggest themselves to the reader, and it is doubtful if there has ever been any one invention in the electrical field that has become more universally adapted than the pocket flashlight.

POPULAR ASTRONOMY.



(*Continued from page 781*)

the planet is best seen. Its flattening at the poles, which is nearly ten per cent of its equatorial diameter gives it a decidedly oval appearance at this time. Ordinarily one of the hemispheres of Saturn is partly or entirely concealed by the rings so that the oblate form is not so noticeable. After the temporary disappearance of the rings in 1920 the earth will pass from a position below the rings to one above them. The northern surface of the rings and the northern hemisphere of Saturn will come more and more into view after this date, the southern surface of the rings being invisible and less and less of the southern hemisphere of the planet being seen until the rings once more approach their widest opening about seven years later. From this time on until the earth is once more in the plane of the rings, after another quarter revolution of the planet, the elevation of the earth above the rings becomes less and less and the width of the system decreases in proportion to its length. It was this change in the tilt and visibility of the rings that so perplexed Galileo when he attempted to make out the nature of these appendages of Saturn with his crude telescope of insufficient magnifying power. So great was his bewilderment when the rings finally disappeared that he cried out in despair that Saturn must have swallowed his children, according to the legend. He finally became so exasperated with the results of his observations that he gave up observing the planet. The true nature of these appendages of Saturn remained a mystery until Huyghens solved the problem in 1655, some time after the death of Galileo.

In addition to the rings, Saturn has nine satellites named in the order of their distance outward from the planet: Mimas, Enceladus, Tethys, Dione, Rhea, Titan, Hyperion, Iapetus and Phoebe. The last mentioned satellite was discovered by W. H. Pickering in 1899. It aroused great interest at the time because it was the first satellite to be discovered with "retrograde" motion in its orbit. Two satellites of Jupiter since discovered revolve in the same direction around their primary.

The satellites of Saturn approximate to

FreeBook
on Signal Engineering

THOUSANDS of miles of railroad must be equipped with block signal systems. To superintend these installations and to maintain the systems now in use thousands of men are necessary. *Golden opportunities are now offered.* Every ambitious man should write for the free book on Signal Engineering.

If you join the army or navy before you have completed the course, further payments will be postponed until you return.

Men Are Needed!

At the present time, less than one-fourth of the passenger lines in the country are equipped with automatic block signal systems—and when you read that the day is fast coming when the law will compel railroads to install them, you will realize what remarkable opportunities are offered to ambitious men in the profession of Signal Engineering. The work is big—broad—high salaries are paid. $250.00 a month is an ordinary salary for a Signal Engineer. Write for particulars.

Send the Coupon

Put your name and address in the coupon, or a letter or post card *now* and get the free book about Signal Engineering. Too, we will tell you how you can get the training that you need in order to become a Signal Engineer. You will be under no obligation in writing for the book.

SKINDERVIKEN TRANSMITTER BUTTON

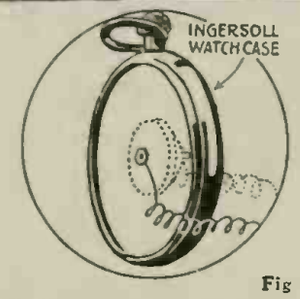

Fig 1

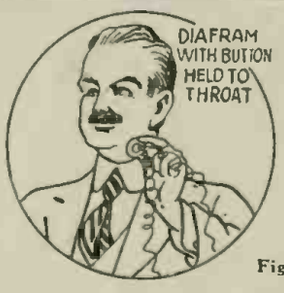

Fig. 2

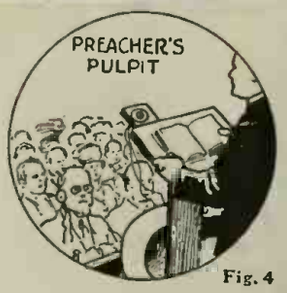
Fig. 3



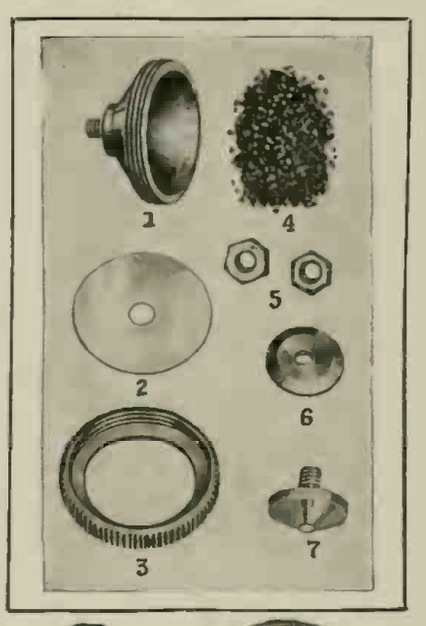


Fig. 4

THE SKINDERVIKEN TRANSMITTER BUTTON presents the latest advance in microphones and marks a revolution in transmitter construction. It works on an entirely new principle, takes up practically no room, and marks the end of all telephone transmitter troubles.

The SKINDERVIKEN TRANSMITTER BUTTON can be placed in any position and it will talk loudly and distinctly and is at the same time extraordinarily sensitive. It was primarily designed to replace the old damaged or burnt-out transmitter. Simply unscrew and remove the telephone transmitter front, disconnect the two inside wires, unscrew and remove the bridge and the old electrode. There remains only the diafram. These wires are then connected with the Skinderviken button, the latter screwed to the diafram, and after screwing the old transmitter housing together again, the telephone is ready for work.

ELECTRICAL EXPERIMENTER readers will be particularly interested in all the different experiments that can be performed with the Skinderviken Button. Fig. 1 shows the Skinderviken button attached to the back of an Ingersoll watch case. When speaking towards the inside of the case, it will be found that the voice is reproduced clearly and loudly,

$1.00 Prepaid

This shows how button is attached to ordinary telephone transmitter.

Fig. 2 shows another interesting stunt. By attaching the button to a tin diafram about the size of half a dollar, and by holding the diafram at the side of the throat, as shown, speech can be transmitted with surprising clarity. Fig. 3 illustrates the same arrangement placed on the chest as shown. In this position the transmitter will talk clearly and loudly. Fig. 4 shows an arrangement whereby the Skinderviken button is attached on a thin wood board at the preacher's pulpit. His voice is clearly transmitted so that people hard of hearing can readily hear the sermon. Fig. 5 shows how a very sensitive Detectophone can be made by placing one of the buttons in the center of a lithographed cardboard picture, so that only the small brass nut shows. The large surface of the picture acts as a big diafram, and the voice is well reproduced. Fig. 6 shows an interesting stunt, whereby a hole is drilled in the side of a thin glass water-tumbler; the sides of the glass thus acting as a diafram, the voice is clearly transmitted. Fig. 7 shows a simple match box Detectophone. The Skinderviken button is concealed inside of the box, only the small brass nut showing on the outside. This can be camouflaged as well. This device talks well. Fig. 8 shows how to transmit phonograph music at a distance merely by drilling a small hole in the phonograph arm and attaching the Skinderviken button; a very favorite experiment with all experimenters.

We have such unlimited confidence in the Skinderviken Transmitter Button that we make the following remarkable offer. Send us one dollar ($1.00) for which we will mail one button prepaid. If you do not wish to keep it, return it within five days and your money will be refunded. Boys! send stamp for booklet No. 4. It gives diagrams and experiments using the Skinderviken Transmitter Button, and prices of telephone equipment.

ALSO ALL KINDS OF TELEPHONE PARTS FOR EXPERIMENTERS
at prices far below the actual cost of manufacture

POPULAR ASTRONOMY.

(*Continued from page* 821)

those of Jupiter in size and exactly equal them in number. The largest, Titan, is three thousand miles in diameter and can be seen with the smallest telescopes. With a four-inch telescope five of the satellites can be easily found tho they are not as interesting to observe as the satellites of Jupiter because they are on the average four hundred million miles more distant. The time they require to make one journey around Saturn varies from nearly twenty-three hours for Mimas, the nearest, to approximately five hundred and twenty-four days for Phoebe, the most distant.

Like Jupiter, Saturn is marked by belts parallel to the equator tho they appear more indistinct than those of Jupiter on account of the greater distance of Saturn. Saturn also resembles Jupiter in its physical composition which is largely, if not entirely, gaseous and in the extremely short period of rotation on its axis which is approxmately ten hours. In more ways than one Saturn is a very unusual planet. In addition to possessing an enormous ring system it is the lightest of all the planets, its density being only sixty-three hundredths that of water, and it is the most oblate, its

Fig. II Shows (On a Scale Reduced Ten Times From That of Fig. I) the Orbits of the Outer Satellites. Even on This Reduced Scale It Is Impossible to Represent the Orbit of Phoebe, the Most Distant, Which Is Three and Six-Tenths Times More Distant Than Japetus.

flattening at the poles amounting nearly to one-tenth of its diameter. Its equator is more highly inclined to its orbit than is the case with any other planet, not even excepting the earth and Mars. For this reason its seasonal changes are very great, in marked contrast to Jupiter whose equator lies very nearly in the plane of its orbit. Since Saturn is so far away from the sun that it receives only one-ninetieth as much light and heat per unit area as the earth, its outer gaseous surface must be extremely cold unless considerable heat is conveyed to the surface from within its hot interior.

Prof. Lowell concluded from certain observations made at Flagstaff, Ariz., that Saturn is composed of layers of different densities and that the inner layers are more flattened at the poles and rotate faster than the outer layers. Marked variations in the color and brightness of the ball of the planet have been noted from time to time. In 1916 observers of Saturn described the planet as pinkish-brown and conspicuously darker than the brighter portions of the rings. The ringed planet may now be found in the constellation of Leo not very far from the star Regulus at the end of the handle of "The Sickle." It is more than twice as bright as Regulus and of a yellowish tinge. As it was in opposition to the sun on February 14, it is now most favorably placed for observation, being visible all thru the night.

"THE BORDER WIRELESS" AND "THE HUN WITHIN."

(*Continued from page* 768)

cause of his hatred for Prussian autocracy and who has become intensely American. His son Karl, however, whose nature is cold, is pro-German despite his father's protests, and after being educated in Germany he returns home just before Germany involves the world in war.

Near the Wagner home lives an invalid, with her daughter, Beth, a charming patriotic girl. The girl's father at his death begs Wagner to watch over Beth and she seems devoted to Karl; he offers no protest. Frank Douglas, a schoolmate of Beth's, is devotedly attached to her and her seeming preference for Karl causes him great anxiety. Beth is living in the Wagner home and there meets Grippen, a German spy, who is assisted by Leone, known as the "Lynx," a German Secret Service agent, and Krug, a spy, who is a sailor on a transport. Douglas enters the United States Secret Service as operative and is trailing Leone.

At dinner, young Wagner takes the oath binding himself to the service of the Kaiser. It is determined by Grippen and his agents to destroy American shipping and when war is declared by the United States against Germany, Grippen resolves to destroy transports conveying troops to France. Beth is seated in an easy chair one night when she overhears Leone tell Karl that Krug has planted a bomb, secreted in a thermos bottle, on board a transport, and that it has been timed to explode at midnight on the date of sailing of the vessel.

Shocked at this proof of the perfidy of the man she believed she loves, Beth upbraids Karl, whereupon he binds and gags her and then conveys her to the mountains where Grippen's lair is located. Douglas is trailing the spies persistently and they decide to get rid of him. He is kidnapt and when his senses leave him, the spies throw him out of an automobile into a creek. This revives him and he makes his way with difficulty to the spy rendezvous where he discovers that Beth is a prisoner.

He eludes the guard and obtains access to Beth who tells him of the attempt to be made to destroy the transport. He has a fierce battle with the guards, but manages to place Beth in an automobile and start at full speed to warn the authorities of the transport's peril. They reach the Wagner home after Karl's departure and when the father hears of his son's traitorous conduct he is frantic with rage. The *telephone* having been put out of commission by Karl, Beth leaves for a *wireless station* near by.

Karl returns home and when his father upraids him, he shoots him. A mob gathers outside and Karl is about to be lynched when a troop of cavalry saves him. He and Grippen are taken in custody for trial. Meanwhile Beth and Douglas reach the wireless station and altho the bomb is to explode at midnight, the operator at ten minutes of that hour, has failed to get in touch with the transport.

Krug is about to jump overboard to escape the fate he and his confederates have prepared for the troops aboard the transport, when Beth's wireless message is received and he is apprehended. The bomb is discovered at one minute of twelve o'clock and it explodes as it is hurled into the water. The elder Wagner recovers from his wound and Beth and Douglas plight their troth.

THOSE PASSIONATE "THREE WEEKS" AGAIN.

Ever read many electrical advertisements? Here's a gem, culled from a South Carolina newspaper by Seymour Paul, of the U. S. Field Artillery Depot, Camp Jackson. Thanks, Seymour, call again. And, say, while we think of it, you ought to see the hundreds of letters we receive in which the words "oscillating" and "faulty" are mis-spelled and [illegible]. What's the use—they [illegible] ing it.

"I Got the Job!"

"I'm to be Manager of my Department starting Monday. The boss said he had been watching all the men. When he found I had been studying at home with the International Correspondence Schools he knew I had the right stuff in me—that I was bound to make good. Now we can move over to that house on Oakland Avenue and you can have a maid and take things easy. I tell you, Nell, taking that course with the I. C. S. was the best thing I ever did."

Spare-time study with the I. C. S. is winning promotions for thousands of men and bringing happiness to thousands of homes all over the world. In offices, shops, stores, mines, mills and on railroads, I. C. S. trained men are stepping up to big jobs, over the heads of older men, past those whose only qualification is long service.

There is a Job Ahead of YOU

Some man is going to be picked for it. The boss can't take chances. When he selects the one to hold it he is going to choose a trained man with sound, practical knowledge of the work. Get busy right now and put yourself in line for that promotion. You can do it in spare time in your own home through the International Correspondence Schools, just as nearly two million men have done in the last twenty-seven years, just as more than 100,000 men are doing today.

The first step these men took was to mark and mail this coupon. Make *your* start the same way—and make it right now.

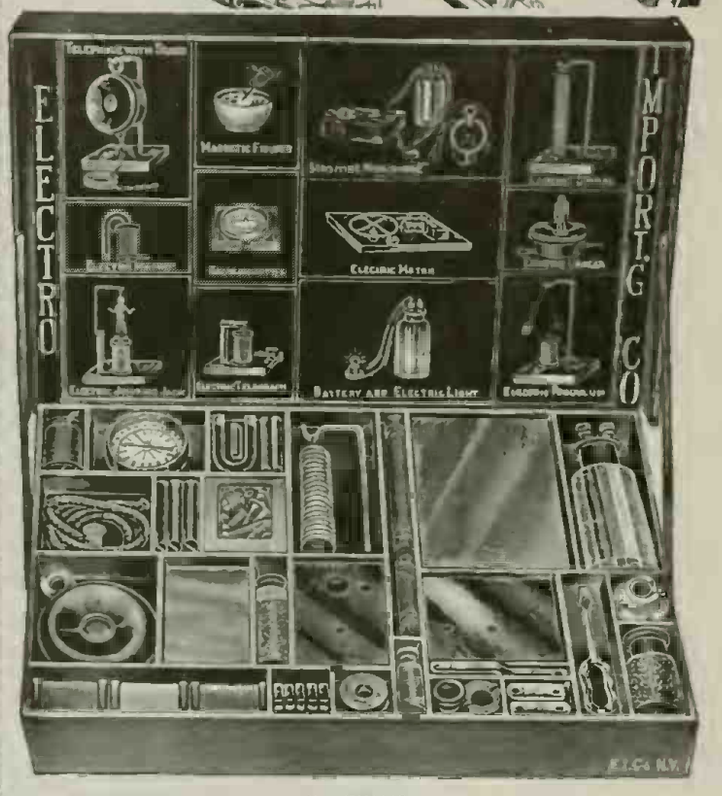
$5. EXPERIMENTERS!

A Sample of What You Can Do With This Outfit

This illustration, made from an actual photograph, shows only a very few instruments that can be made with the **Boy's Electric Toys**: Electric Pendulum, Electric Telegraph, Current Generator, Electric Dancing Spiral, Galvanometer, Space does not permit us to show the hundreds of experiments that can be performed with this wonderful outfit.



The outfit contains 114 separate pieces of material and 24 pieces of finished articles ready to use at once.

Among the finished material the following parts are included: Chromic salts for battery, lamp socket, bottle of mercury, core wire (two different lengths), a bottle of iron filings, three spools of wire, carbons, a quantity of machine screws, flexible cord, two wood bases, glass plate, paraffine paper, binding posts, screw-driver, etc., etc. The instruction book is so clear that anyone can make the apparatus without trouble, and besides a section of the instruction book is taken up with the fundamentals of electricity to acquaint the layman with all important facts in electricity in a simple manner.

We guarantee satisfaction.

The size over all of the outfit is 14x9x2¾. Shipping weight, 8 lbs. **No. EX2002 "The Boy's Electric Toys." outfit as described.** **$5.00**

IMMEDIATE SHIPMENTS

No. EX2002

"THE BOY'S ELECTRIC TOYS" contains enough material TO MAKE AND COMPLETE OVER TWENTY-FIVE DIFFERENT ELECTRICAL APPARATUS without any other tools, except a screw-driver furnished with the outfit. The box contains the following complete instruments and apparatus which are already assembled:

Student's chromic plunge battery, compass-galvanometer, solenoid, telephone receiver, electric lamp. Enough various parts, wire, etc., are furnished to make the following apparatus:

Electromagnet, electric cannon, magnetic pictures, dancing spiral, electric hammer, galvanometer, voltmeter, hook for telephone receiver, condenser, sensitive microphone, short distance wireless telephone, test storage battery, shocking coil, complete telegraph set, electric riveting machine, electric buzzer, dancing fishes, singing telephone, mysterious dancing man, electric jumping jack, magnetic geometric figures, rheostat, erratic pendulum, electric butterfly, thermo electric motor, visual telegraph, etc., etc.

This does not by any means exhaust the list, but a great many more apparatus can be built actually and effectually.

With the instruction book which we furnish, one hundred experiments that can be made with this outfit are listed, nearly all of these being illustrated with superb illustrations. No other materials, goods or supplies are necessary to perform any of the one hundred experiments or to make any of the 25 apparatus. Everything can be constructed and accomplished by means of this outfit, two hands, and a screw-driver. (Continued in next column)

"The Livest Catalog in America"

Our big, new electrical cyclopedia No. 19 is waiting for you. Positively the most complete Wireless and electrical catalog in print today. 228 Big Pages, 240 Illustrations, 500 instruments and apparatus, etc. Has **"Treatise on Wireless Telegraphy."** 20 FREE coupons for our 160-page **FREE** Wireless Course in 20 lessons. **FREE** Cyclopedia No. 19 measures 7x5¼". Weight ½ lb. Beautiful stiff covers.

Fig. 5

erviken Telephone Equipment Co.

The "Electro" Radiotone
HIGH FREQUENCY SILENT TEST BUZZER

This instrument gives a wonderful high pitched **MUSICAL NOTE** in the receivers, impossible to obtain with the ordinary test buzzer. The **RADIOTONE** is built along entirely new lines; it is **NOT** an ordinary buzzer, reconstructed in some manner. The **RADIOTONE** has a single fine steel reed vibrating at a remarkably high speed, adjusted to its most efficient frequency at the factory. Hard silver contacts are used to make the instrument last practically forever.

Yes, the **RADIOTONE** is **SILENT.** In fact, it is so silent that you must place your ear on top of it to hear its beautiful musical note.

You will be astounded at the wonderfully clear, 500 cycle note, sounding sharply in your receivers. **To learn the codes there is absolutely nothing like it.** With the radiotone, a key and one dry cell and ANY telephone, a fine learner's set is had. Two or more such sets in series will afford no end of pleasure for intercommunication work. **Shipping Weight 1 lb.**

Radiotone as described.....each **$.90**

IMMEDIATE SHIPMENTS

The "Electro" Telegraph

is not a toy, but a practical, honestly built telegraph outfit, which not only sounds but works like the big commercial instruments. By studying the code for 30 days you can become a first-class telegraph operator. Such operators are in big demand now. Outfit consists of TWO complete telegraph instruments each measuring 3½ x 2½ x 2¼. All metal parts are highly nickel plated, including key lever. Note hard rubber knob. Telegraph Code Chart, telegraph blanks and connecting wire comes with set, but no batteries. Outfit works on 2 dry cells (one cell for each instrument). The "Electro" is the ONLY Outfit that works both ways, each station can call; no switches, no extra. Nothing to get out of order. Guaranteed to please You or Money back. **Price Complete as illustrated (TWO INSTRUMENTS).... $1.25**

Shipping Weight, 2 lbs.

IMMEDIATE SHIPMENTS

The "Electro" Codophone (*Patents Pending*)

$1.50

What this remarkable instrument is and does.

The "Electro" **Codophone** is positively the only instrument made that will imitate a 500 cycle note exactly as heard in a Wireless receiver. The hand-talking receiver equipped with a horn, talks so loud that **you can hear the sound all over the room,** even if there is a lot of other noise.

THAT'S NOT ALL. By lessening or lightening the receiver cap, a tone from the lowest, softest quality, up to the loudest and highest screaming sound can be had in a few seconds.

FOR INTERCOMMUNICATION. Using two dry cells for each instrument, two **Codophones** when connected with one wire and return ground, can be used for intercommunication between two houses one-half mile apart.

One outfit alone replaces the old-fashioned learner's telegraph set, consisting of key and sounder.

The "Electro" **Codophone** is a handsome, well made instrument, fool proof, and built for hard work. Contacts are of hard silver ⅛ inch in diameter, that will outlast the instrument.

There is also a neat code chart and full directions **enabling any intelligent young man or girl to learn the codes within 30 days, practising one-half hour a day.**

Size: 6¾ x 3 x 2⅝." Shipping weight, 2 lbs. **$1.50**

The "Electro" Codophone as described, complete.....

PATENT ADVICE

Edited by H. GERNSBACK

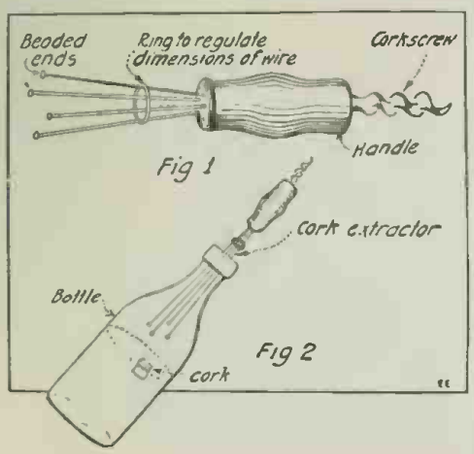
In this Department we publish such matter as is of interest to inventors and particularly to those who are in doubt as to certain Patent Phases. Regular inquiries address to "Patent Advice" cannot be answered by mail free of charge. Such inquiries are publisht here for the benefit of all readers. If the idea is thought to be of importance, we make it a rule not to divulge all details, in order to protect the inventor as far as it is possible to do so.

Should advice be desired by mail a nominal charge of $1.00 is made for each question. Sketches and descriptions must be clear and explicit. Only one side of sheet should be written on.

NOTICE TO CORRESPONDENTS

Questions on Patent Advice are answered in this department every month, and naturally each question must take its turn. We have received so many letters during the past months that it is absolutely impossible for us to answer them all in the "Experimenter." Thus, for instance, the answers appearing in this issue are of letters going back as far as July, 1918. We would therefore urge our correspondents to bear this in mind, and if an answer is wanted quickly, correspondents should make themselves acquainted with the rules printed above.

Resistance Measuring Instrument.

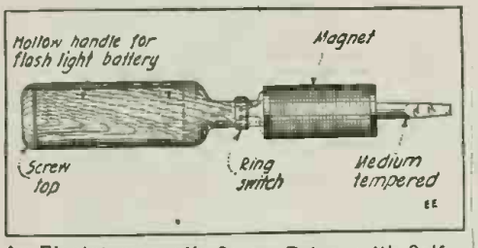


(305) John E. Wheatley, Roachdale, Ind., has invented a device for measuring resistance directly. The device was designed to replace the voltmeter-ammeter resistance circuit and Wheatstone bridge for measuring distances. Our correspondent states the case correctly that both of these methods are intricate and usually require some calculation and too much time. Our correspondent further discloses the construction of his instrument which has a scale working like an ordinary meter, so that the resistance can be read off directly without the necessity of calculation, etc.

A. While there are direct reading ohm-meters on the market, the device in question certainly has unusual merit; and if it can be marketed cheap enough, say for anywhere from fifteen to twenty dollars, we believe that there is a big market for such an instrument. We think a patent can be obtained.

Combination Cork Screw and Cork Extractor.

(316) Dan Lingo, Huntington, Ark., submits an idea of a combination cork screw and cork extractor, and our illustration shows the idea, which consists of a handle, cork screw on one end and beaded wire ends with the ring, at the other side. The *modus operandi* is shown in Fig. No. 2. With a device of this kind as is well-known the cork can be extracted very readily once it was pushed inside of the bottle.



A. The idea is a good one, and while there is of course nothing new as far as the two utensils are concerned, the combination of the two into one is undoubtedly a good feature. To our mind, if the wires could be pushed inside of the handle, out of the way, it would be an added feature of merit. We believe a patent can be obtained on a device of this kind.

Clever Combination Cork Screw and Cork Extractor.

Electro-Magnetic Screw Driver.

(317) Vernan Clements, Elmwood, Nebraksa, submits a clever device which he terms an "electro-magnetic screw driver." The sketch shows the idea which consists of a screw driver with electro-magnet, the latter being energized by a battery held in the hollow handle. Current is supplied to the magnet by means of a switch ring. Our advice is asked.

An Electro-magnetic Screw Driver with Self-contained Battery in Handle.

A. This at first blush seems a good idea, and if the screw driver is only used for a few seconds at a time, which it probably would, it possibly will work satisfactorily, for the magnetism is only used to pick up a screw and hold it long enough until the latter is set; then the current is *supposed* to be turned off. We say *supposed*, but it probably never is. The user would most likely forget to turn off the switch, with the result that the small battery would run down very shortly, and this is where the trouble lies. Otherwise, however, we see no fundamental objection. We are not quite certain if a patent can be obtained, as it seems to us we have seen a similar idea once before. Search in the patent office would, to our mind, amply repay our correspondent.

Trolley Wheel.

(308) Russell A. Adams, Battle Creek, Mich., has sent sketch and description of a trolley wheel.

U.S. PATENTS

SEND FOR THIS FORM

Don't Lose Your Rights

Before disclosing your invention to anyone send for blank form "Evidence of Conception" to be signed and witnessed. A sample form together with printed instructions will show you just how to work up your evidence and establish your rights before filing application for patent. As registered patent attorneys we represent hundreds of inventors all over the U. S. and Canada in the advancement of inventions. Our schedule of fees will be found reasonable. The form "Evidence of Conception," sample, instructions relating to obtaining of patent and schedule of fees sent upon request. Ask for them,—a post card will do.

which is supposed to stay on the wire, a solution often thought of by inventors. Our correspondent tries to overcome the objectional feature of a wire jumping trolley by using two side shoes, pressing against the upper circumference of the trolley wire. Several other ingenious points are also shown in this idea.

A. Nothing fundamentally new is contained in this idea, and our opinion is that inventors should steer clear of trolley wheel improvements. There are literally thousands of such patents, and not one of them to our mind has ever been adopted by any of the traction companies. For many reasons the electric railway people seem to think that the old copper wheel is still the best. It is the same as the old-fashioned telephone receiver, which has been on our telephones for the past generations. While thousands upon thousands of patents—real good ones, too—have been issued, for some reason or other, the old receiver is still on the job and probably will be for many years to come. Our advice to inventors is to leave trolley wheels alone, and guide their ingenuity and inventiveness into other and more productive channels.

FIVE CONVERSATIONS OVER ONE WIRE.

(*Continued from page 766*)

thus gives the voice wave an identity of its own and at the end of the journey the waves are sorted and directed into their proper channels to be delivered as formed originally.

But how do these five telephone currents pass over the circuit simultaneously without becoming all mixed up, you ask. "Imagine, for example," said Mr. Gherardi, "a composite photograph, in which each of five subjects is photographed in a *different* color, one red, one blue, one green, one orange and one violet. In the composite picture the colors as well as the features are blended, but when you look at it thru colored glasses, each picture may be distinguished from the others. Thru red glasses the red photograph is shown, thru blue glasses the blue photograph comes up most clearly, and so on."

There are several other analogies in physics, which will bring out the working action of the control and filtering of these "carrier" currents. First there is ordinary sunlight. A beam of this white light is made up of a composite bundle of six primary colors, each color representing a different and distinct vibration frequency of the ether particles. Thus we find that the beam of white light is first produced or formed in the sun, where many different chemicals are in a state of combustion—each with a spectrum color of its own; all combine and form white light—the sun's rays. These composite rays, combining six predominating ether wave frequencies or colors—red, orange, yellow, green, blue, and violet—(not to mention a host of other intermediate shades of colors with their corresponding and distinct frequencies*), are transmitted thru the intervening ether to our earth. Now, if we take a glass prism, see figure "A," and pass a beam of sunlight (white light) thru it as shown, then we will see the composite colors corresponding to the different frequencies projected on the sheet at the left, in the order named.

A second phase of this experiment, familiar to every high-school boy, is that of the "synthesis of light", illustrated at figure "B". Here we have a beautiful analogy to the multiplex telephone which can be easily demonstrated. A beam of white light (sunlight) of many frequencies, is past thru the first prism, but as it emerges after being filtered by prism No. 1 the separated frequencies (colors) are recombined by prism No. 2, and formed into a "composite medium of transmission", such as that which traverses the telephone wire when the five telephone currents are applied to it.

A simple diagram for duplex telephony by the Squier's system is here shown. Major-General G. O. Squier proposed his multiplex telephone and telegraph system in 1911. He applied wireless currents to wire systems and thus it was called Squier's "wired wireless". His invention had the

* See Wood's "Physical Optics", page 11, for table of different wave lengths (inverse of frequencies) of various colors.

www.americanradiohistory.com

germ of the present multiple telephone in it. There were a number of high frequency generators (radio telephone transmitters) connected across the common telephone system, one way being shown, and a corresponding number of tunable radio receiving stations connected across the same pair of wires. Thus each radio frequency current (30,000 cycles and higher, so as to be inaudible) would be picked off the line and past thru its own particular and properly tuned receptor. The universal operating characteristics of the audion type of vacuum relay as devised by Dr. Lee de Forest solved the problem of making such a system adaptable to the use of the public.

Credit for the pioneer work accomplisht by these men is given in the signed statement announcing the successful solution of the multiplex telephone problem addrest to Hon. Albert S. Burleson, Postmaster General, Washington, D. C., by Theodore N. Vail, President of the A. T. & T. Co., on December 11, 1918, which includes the following citation:—

"From the earliest days of both the telephone and the telegraph, there have been almost numberless attempts by inventors, scientists, and engineers to develop methods for the multiplex transmission of messages. It was while working on the problem of multiplex telegraphy that Dr. Bell had his first conception of the structure of the original telephone. Now the organization, which is continuously working to perfect the telephone and to extend its usefulness, has accomplisht not only multiplex telephony, but also multiplex telegraphy and has solved the telegraph problem upon which Dr. Bell was working over forty years ago.

"While heretofore no substantial practical results had been obtained notwithstanding the efforts which have been directed to this problem, some proposals made by the earlier workers in this particular field have naturally proved suggestive in the successful solution of the problem. I have in mind particularly a suggestion made by Major General George O. Squier, Chief Signal Officer of the United States Army, about ten years ago and which at the time attracted very general attention.

"Furthermore, while working in entirely different fields and with a different objective, Dr. Lee de Forest a number of years ago invented a wireless device known as the audion which by our improvements and adaptation we have made an important part of our system."

We all know, or at least have heard, that there are ranges of frequencies, both electrical and mechanical, that are beyond the limits of perception by any of our five senses. But telephone engineers have found out that currents of high frequency, for example, obey the same laws as currents of low frequency, and they have found out further that these high frequencies have a particular liking for circuits specially dimensioned to receive them, and that each particular high frequency, or range of high frequency, if given a chance to choose between a number of different circuits, will select the one best adapted to its needs, and travel down it in preference to all other circuits.

Now it is possible by the multiplex method to utilize a single pair of wires for five conversations, while two pairs of wires, which heretofore had a maximum of three conversations with the aid of the "phantom," may now be multiplexed to carry *ten* simultaneous conversations. This amounts to an increase of more than *threefold* in the telephonic carrying capacity of the wires as compared with the best methods previously known to the art, and an increase of *fivefold* in the capacity under conditions where the phantom circuit just alluded to is not employed.

The new multiplex system makes use of alternating currents whose frequencies oc-

Can YOU Honestly Ask Any Girl To Marry You?

LIONEL STRONGFORT

"Dr. Sargent of Harvard, declared that Strongfort is unquestionably the finest specimen of physical development ever seen."

CAN you marry any girl, without making her the victim of the meanest kind of deceit a man is capable of? *Are you fit to be a husband*, fit to make the girl you love the mother of children who will inherit YOUR traits of body and mind? *Think*, and think hard, before you ask her to give her body and soul into your keeping, unless you are FIT. You know what the Law of Heredity is—there's no beating it: what YOU are when you become a father your children ARE bound to be.

Make Yourself Fit to Be a Father

If you are skinny, undeveloped, weak, watery-blooded, *build yourself up before you marry*, so your children will not be rickety imitations of yourself. If you are dyspetic, bilious, constipated, or the victim of any other chronic ailment, such as youthful errors, vital losses and consequential impotency, get rid of these handicaps; don't take the risk of passing them on, in an exaggerated form, to the helpless little children you will bring into the world. You can't commit a worse CRIME than to make a sweet, pure, trusting girl the mother of weak, ailing, defective children who will be a sorrow to her and a reproach to you as long as you both live.

Have Healthy, Happy Children

You can do it: you can make yourself healthy, strong, vigorous, full of LIFE and the joy of living, and capable of transmitting that health and strength and happiness to children who will be full of rollicking fun, a comfort and a blessing to you and to the girl you marry. No matter how low down you have got in the human scale, and no matter how you got there, YOU CAN COME BACK, if you go about it the right way.

I don't care how much druggist's dope or patent piffle you may have tried without success; three hundred years ago the greatest brain in England wrote "Throw Physic to the Dogs"—and Shakespeare knew, as every doctor knows today, that physic isn't the kind of food that makes men strong and vital, that fills them full of overflowing life and energy and spirit.

Get Strong in Nature's Way

Give old Mother Nature a chance to cure your ailments and build you up, by living in the way she meant you to live, and you'll be amazed in a few weeks' time at the improvement in yourself. There's no guesswork about it, there's no doubt about what she can do for you; and there isn't any other way: Nature's way is the ONLY way many men on the ragged edge of being thrown into the everlasting scrapheap of humanity can EVER get back the health and strength and vigor and vitality of a MAN.

I KNOW: I've tried it, not only on myself—and I am called the strongest man in the world today—but also on thousands of miserably ailing, weak, downcast, discouraged men, suffering from early indiscretions, vital losses and other troubles, that are the result of these ailments, who found their first ray of hope and comfort and quick improvement in the system of **Strongfortism** that I teach. **I will help YOU**, as I have helped them, and as I am helping other men in every quarter of the civilized world today. I will show you how to shuffle off your ailments, how to develop your muscles, reinvigorate your vital organs, steady your nerves, clear your brain; how to become, in a short time, a 100 per cent Man and take the place in the world you ought to hold.

Send for My Free Book

I have put the results of my life's study, research and experimentation on the subject of man's vitality and vigor into a book called **"Promotion and Conservation of Health, Strength and Mental Energy."** It will tell you all about Strongfortism, show you how thousands of men who had lost their grip were able to become red-blooded, vigorous citizens again, and point out the way—the simple, easy, natural, quick way in which YOU can gain and retain health and strength and the ability to enjoy life. Send three 2c stamps to cover postage and packing and I will mail a copy to your address at once.

MAGNETIC RECTIFIER
Patented April 18, 1916

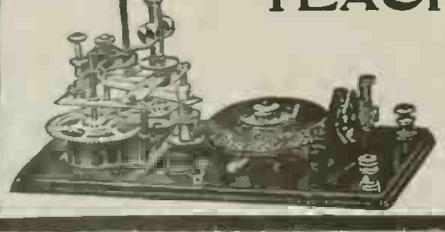
COLD WEATHER WON'T BOTHER YOUR STARTER
If you keep your battery charged up with an

F-F BATTERY BOOSTER

CONNECT to any lamp socket without removing battery from car or breaking any electrical connections. Changes alternating to direct charging current, and will completely fill your battery over night.

The Private Garage types cost only $24.00 and come complete with long cord and plug to fit any lamp socket, ammeter, which tells what current is flowing into the battery and charging wires fitted with clips, to snap on the battery terminals.

Thousands in use giving satisfaction.



Write today for Bulletin No. 12, or send us your order. Money back if you want it.

What 15c will bring You from the Nation's Capital

Washington, the home of the Pathfinder, is the nerve center of civilization; history is being made at this world capitol. The Pathfinder's illustrated weekly review gives you a clear, impartial and correct diagnosis of public affairs during these strenuous, epoch-making days.

The little matter of 15c in stamps or coin will bring you the Pathfinder 13 weeks on trial. The Pathfinder is an illustrated weekly, published at the Nation's center, for the Nation; a paper that prints all the news of the world and tells the truth and only the truth; now in its 26th year. This paper fills the bill without emptying the purse; it costs but $1 a year. If you want to keep posted on what is going on in the world, at the least expense of time or money, this is your means. If you want a paper in your home which is sincere, reliable, entertaining, wholesome, the Pathfinder is yours. If you would appreciate a paper which puts everything clearly, fairly, briefly—here it is. Send 15c to show that you might like such a paper, and we will send the Pathfinder on probation 13 weeks. The 15c does not repay us, but we are glad to invest in new friends. The Pathfinder, Box 76, Washington, D. C.

cupy a range between the frequencies of the ordinary telephone currents, which are those of the human voice, and the lowest frequencies which are used in wireless communication. This frequency range has not heretofore been commercially used. It is interesting to note that under favorable conditions the whole range is audible to many and the lower part of the range is audible to any one with normal hearing. It is found that frequencies within this range are high enough to be used as "carriers" of ordinary telephone currents and yet with proper arrangements can be transmitted over long telephone lines without the large transmission losses and large interference between circuits which would be brought in by higher frequencies.

Each *additional* circuit in the new system makes use of some frequency within this range. At the sending end of each circuit the ordinary telephone currents are made to modulate this "carrier" frequency by means of an audion tube so that the amount of carrier frequency sent out on the line varies with the amplitude of the ordinary telephone currents. At the receiving end the carrier current is put into a demodulating circuit, which includes another audion, and which then gives out the original telephone current.

The different circuits are kept separate at each end by inserting in each circuit a combination of impedances which make up an electrical "filter." This transmits the range of frequencies peculiar to that circuit and stops all other frequencies. An important difference should be noted here between this system and wireless systems in that in wireless working it has been generally sufficient to send and receive in "tuned" circuits. In the multiplex system, however, tuned circuits would not be sufficient since each telephone channel occupies a range of frequencies of about 2,500 cycles and any circuit tuned to these comparatively low frequencies would be too selective to receive such a range in the proper manner.

Vacuum tubes (audions) are used in the modulating and demodulating circuits and are also used as amplifiers in the transmitting and receiving branches and at intermediate points along the line where necessary to prevent the currents from becoming too highly attenuated.

In regard to the increased telegraphic capacity afforded, Mr. Gherardi stated:—"The advantages of the system when applied to telegraphy as well as to telephony were clearly shown in our tests. We found that we can combine our system with the printing telegraph so as to secure the full advantages of the latter and the full advantages of the multiplex system in reducing wire requirements. Using our multiplex system with the ordinary hand operated telegraph instrument, connected with a telephone circuit, we can send from 1,500 to 1,600 words in a minute. When the multiplex system is connected with the printing telegraph, we can send from 4,000 to 5,000 words in 60 seconds."

GOLD AND SILVER LOCATED WITH SOUND WAVES.

(*Continued from page 769*)

the ore bodies. For example, if the distance between the record made on the oscillograph, R—O_1, by the transformer on depressing the key K, and the record made by the arrival of the sound directly along the line Q, which would be the first sound to record itself after the depression of the key, is five inches—then *one inch* on the photographic record corresponds to *one mile* in distance, since drill hole A is located five miles from the drill hole D. This establishes the standard of measurement on the oscillograph.

Now for example, if the length between the key depression record and the record made at D, by the sound reflected at P is

www.americanradiohistory.com

9 inches, it is evident that the sound proceeding from O and reflected at P, and finally reaching D, has traveled 9 miles. If, again, the length between the key depression record on the oscillograph, R—O_1 and the record made by the sound sent out from O, and reflected back from J, Fig. 2, is 8 inches, then it follows that the ore body I, is located approximately 4 miles from the point A. The ore deposit therefore lies at the intersection of the sphere described about O, with a radius of 4 miles, with the sphere described about D_1 with radius 9 minus 4, i. e., 5 miles.

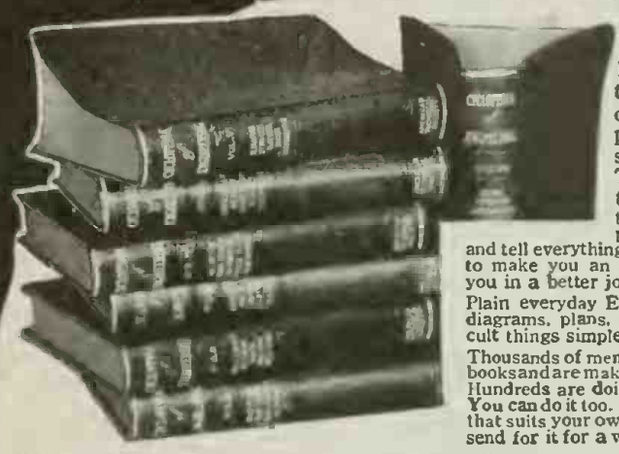
There are a number of ways outlined in Prof. Fessenden's description of his invention, which may be utilized for locating the exact point on the line of intersection where the ore bodies are located. As he points out, it is possible to find this point of intersection by merely determining the time elapsing between the key depression record and the echo record made by reflection, say at J, Fig. 2, together with a determination of the direction from which the echo is received. The extent of the ore body can be obtained by readings taken by transferring the oscillator O, to the other drill holes and taking readings on the oscillographs on sending out sound waves at these drill holes.

Prof. Fessenden also describes special apparatus for determining accurately the direction of the sound received, which employs two of his oscillators connected together, differentially. This scheme of locating ore deposits may sound a little hazy or improbable at first glance, but the theory can be readily tried out by means of a small siren and a reflector or two, together with some auxiliary apparatus which any electrical experimenter can readily devise, the difference in such an experiment being that the sound waves will then be detected, reflected or refracted in air, whereas in applying this system to the locating of buried ore deposits, the sound waves have to travel thru rock and soil as well as water, in which mediums the velocities of sound propagation varies considerably. The velocity of sound propagation thru water is about four times as great as that thru air, or approximately 1,100 feet per second for air and 4,700 feet per second for water.

BOOK REVIEW.

(*Continued from page* 804)

teries, theory of telephone and field buzzer circuits—with many diagrams. The section devoted to radio is practically a reprint in whole from "Radiotelegraphy" as published by the signal division of the U. S. Army—but which, of course, must needs finds its place in a work of this kind, and serves to cover all that need be known by a radio man of the signal corps.



Two closing chapters are devoted to methods of handling traffic, various codes—secret ciphers—Wigwagging—Signaling with lamps—searchlights—sun or heliograph and the Semaphore. Signal troops in the field—Laying out camps, Map reading and the general function that the Signal Corps fills in both war and peace—general field duty and coast defense.

The volume is dedicated to Major-General George O. Squier, Chief Signal Officer, U. S. Army, whose assistance made the book possible. It is an ideal manual and has all the usually needful information possible incorporated between its covers and should prove an essential to all enlisted men seeking promotion as well as to the layman who is interested in this important branch of the Army's work.

THE BLUEJACKET'S MANUAL, by Lieutenant Norman R. Van Der Veer, U. S. N. Cloth covers, 808 pages, profusely illustrated, size 4¼ x 6¼ inches. Price $1.00. Publisht by Edwin N. Appleton, New York, 1918.

This work is the official reference and study manual used by all naval men. The various operations and practices in naval life are thoroly described and suitably illustrated. The treatment is divided into several parts and again sub-divided so that by reference to the special indexes given in the front of the volume, the student can readily locate certain sections of the text concerning special positions, such as those concerned with ordinary seamen, subjects which chief petty officers should know, and the subjects which men of special ratings should know. This work has been officially past by the Secretary of the Navy.

These Books Will Put You in a Better Job

See the Free Trial offer below and mail the coupon for one of these pay-raising sets of books. They are written by some of the greatest experts in each line and tell everything you need know to make you an expert and put you in a better job.

Plain everyday English, pictures, diagrams, plans, etc., make difficult things simple as A-B-C.

Thousands of men have used these books and are making more money. Hundreds are doing it every day. You can do it too. Pick out the set that suits your own work best and send for it for a week's free trial.

Your Choice Only 50 Cents a Week

Carpentry and Contracting
Five volumes, 2138 pages and more than 400 illustrations. Prepares for Contractor, Building Superintendent and Carpenter Foreman. Regular price, $25.00. Special price, $17.80.

Civil Engineering
Nine volumes, 3900 pages and 3000 illustrations, plates and diagrams. Prepares for Civil or Structural Engineer, Transitman, Estimator, Designer or Chief Draftsman. Regular price, $45.00. Special price, $29.80.

Telephony and Telegraphy
Four volumes, 1723 pages and 2000 illustrations, plates and diagrams. Prepares for Telephone Engineer, Wire Chief, Exchange Manager, Trouble Man or Telegrapher. Regular price, $20.00. Special price, $12.80.

Steam and Gas Engineering
Seven volumes, 3300 pages and 2500 illustrations, plates, diagrams, etc. Prepares for Stationary, Marine or Locomotive Engineer or Fireman. Regular price, $35.00. Special price, $21.80.

Automobile Engineering
Five volumes, 2400 pages and 2000 illustrations. Prepares for Garage Foreman, Automobile Mechanic or Chauffeur. Invaluable to car owners. Regular price, $25.00. Special price, $17.80.

Machine Shop Practice
Six volumes, 2300 pages and 2500 illustrations. Prepares for Machine Shop Superintendent or Foreman, Foundryman, Pattern Maker, Tool Designer or Tool Maker. Regular price, $30.00. Special price, $19.80.

Sanitary, Heating and Ventilating Engin'ring
Four volumes, 1454 pages and more than 1400 illustrations, etc. Prepares for Sanitary Engineer, Heating and Ventilating Engineer, Master Plumber or Plumber. Regular price, $20.00, Special price, $13.80.

Mechanical and Architectural Drawing
Four volumes, 1578 pages and more than one thousand illustrations. Prepares for Architectural or Mechanical Draftsman. Regular price, $20.00. Special price, only $14.80.

Law and Practice
(with Reading Course in 25 bound pamphlets). Thirteen volumes, 6000 pages and 24 illustrations. Prepares for all Bar Examinations. A wonderful aid to business men. Regular price, $72.00. Special price, $39.80.

Practical Accounting
Four volumes, 1840 pages and 800 illustrations, plates and diagrams. C. P. A. questions and practical problems. Prepares for Accountant, Bookkeeper or Cost Clerk. Regular price, $20.00. Special price, $12.80.

Electrical Engineering
Seven volumes, 3000 pages and 2600 illustrations, plates and diagrams. Prepares for Electrical Engineer, Power Plant Superintendent, Substation Operator or Electrician. Regular price, $35.00. Special price, $19.80.

Accountancy and Business Management
Ten volumes, 3630 pages and 1987 illustrations, forms, etc. Prepares for Certified Public Accountant, Auditor, Office Manager, Accountant, Credit Man or Bookkeeper. Regular price, $50.00. Special price, $24.80.

Wireless Taught By Mail

Merchant Marine Needs THOUSANDS of Operators

Men also needed for big Land Wireless Stations—Aerial Mail Service—Railroad and Telegraph companies. Salaries up to $250 a month. Excellent opportunities to win promotion to Radio Engineer—Inspector—or mechanic. Chance to travel the world over or locate at Land Station in America.

Complete Course by Mail in Ten Weeks

Our students actually pass the commercial examination in Ten Weeks or less. Start studying NOW in spare time at home. We send you Complete Set Practice Instruments for receiving and sending messages, while studying our course. We help you secure position in any branch of Commercial or Government Radio Service. Write TODAY for Free Particulars. A postal will do.

NATIONAL RADIO INSTITUTE

Dept. 70 Washington, D. C.

ACCEPT THESE BOOKS FREE

These two 100-page books, each containing from 88 to 90 illustrations, are sold by us regularly at 25c a piece. In connection with this most remarkable offer you can now get them **ABSOLUTELY FREE**, for a *very limited time*.

SINCE we published these two books, over 8,000 of each have been sold. If you are a wireless experimenter, you can ill afford to be without these two latest authoritative works, published by the one concern in America, that knows what the "How-to-make-it Fiend" really wants. In these two hand books are concentrated the most important, up-to-date wireless instruments and directions how to make them. They are by far the most successful wireless books of the season. Size of each book is 5x7 inches, substantially bound on a good book paper. The covers are in two colors. We really can not praise these works too highly. You will be delighted with them.

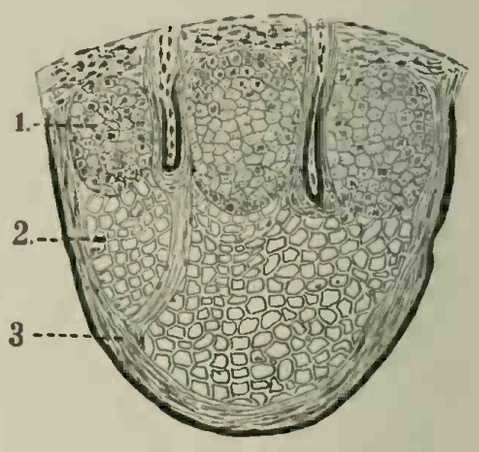
EXPERIMENTER PUB. CO., 233 Fulton St., New York

Gentlemen:

On your absolute guarantee that your two big Wireless Handbooks are just as described by you, you may send me same *FREE*. All charges prepaid. You are to send me these books at once, and enter my name for a full year's subscription to the *Electrical Experimenter*, 12 numbers, for which I enclose *$2.00, the price of the Electrical Experimenter alone.

My name is.....

My address is.....



3-19 *Canada and Foreign Countries, $2.50.

The layman will find in this book all kinds of information concerning naval affairs such as the different sizes and mountings of naval guns, how and what ropes are used for, including the tying of all kinds of rope knots, discussion on modern battleships and other vessels with profile drawings thru the various decks, details concerning pay of enlisted men and officers, also procedure in the matter of enlistments, discharges and court martials, small arms such as the automatic pistol and high power rifles, etc. Other sections deal with the handling of small boats, sails, signals of all kinds, deck seamanship, the compass, log and lead, marching formations, artillery marksmanship, etc. The signal flags for the international code, etc., are printed in colors. The book is well printed and bound, and proves a very good reference volume on the complete detail of naval discipline and all of the operations connected with the handling of naval affairs.

SEARCHLIGHTS OF THE DEEP.

(*Continued from page 772*)

Each light organ contains a number of tiny glands which secrete the light-producing fluid and all glands empty into a con-

Luminous Organ: (1) Lenses Which Concentrate the Light. (2) Glands Which Secrete the Lighting Fluid. (3) Reflector, In Back of Which Is Situated the Black Opaque Membrane.

cave cavity. The action of this fluid can be likened to the effect of the liquid in a wet battery on the electrodes. It acts as a stimulus. A further proof of the chemical action of some of these organs can be found on certain fish which only produce light when the secreted fluid is in contact with the water. Light can therefore be given off after the fish has died. Other species produce their light only thru intercellular action; this of course does not constitute a chemical reaction.

The reflector consists of a silvered or pig-

"THE NATIONAL AUTHORITY ON ELECTRIC WIRING FOR TWENTY-FIVE YEARS"

ALL YOU NEED TO KNOW ABOUT WIRING

IS IN THE LATEST EDITION OF

"STANDARD WIRING"

This year's edition, completely revised to date, is the only accurate book on electric light and power wiring and construction published.

The National Electrical Code, with all its new rules, is explained and illustrated. 52 of the latest and simplest tables which show, at a glance, just what size of wire is needed for any kind and size of lighting or motor installation, for any voltage, current and drop desired for any system. Direct Current, Alternating Current, single, two or three-phase. The latest Code Rules on grounding required on all work.

How to install and operate generators, motors and every kind of wiring device with diagrams of connections. Special chapters on Illumination, House Wiring, Electrical Units and their Equivalents. The latest lamp data. Proper symbols to use to indicate outlets, etc., etc.

It Will Make You an Expert Wireman

www.americanradiohistory.com

mented tissue, which reflects the light outward. An opaque tissue situated just behind the reflector prevents the light from entering the body.

Lenses, which are often present, tend to concentrate and throw the light forward. These lenses consist of a transparent cartilage covered with a transparent skin. In addition some fish even have *shutters* with which they can turn off their light at will.

Many deep sea fish have in addition to their principal organ of light many minor ones, which give the surrounding waters an iridescent glow. As the fish swim along these many varicolored scintillating lights give off a phosphorescent effect. These flickering will-o'-the-wisps of the deep are chased by openmouthed terrors that follow a searchlight at the tip of their own nose.

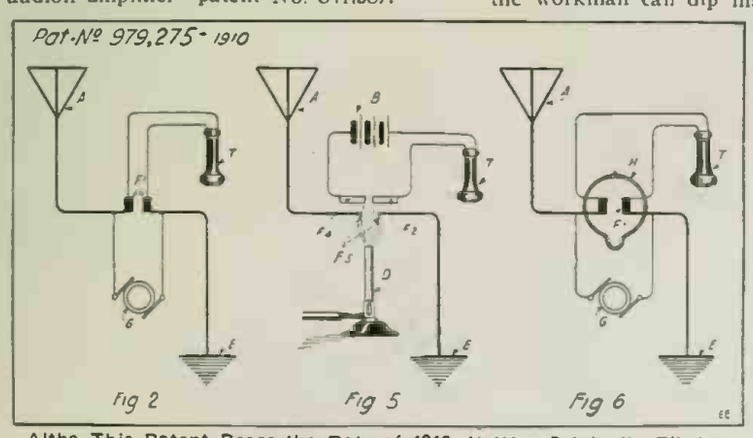
The lights with all their many shades of color, patterns, and places of attachment are primarily used for the identification of the species and the sexes. They are of secondary importance in the aid they give for the search of food, in which case they are undoubtedly used to attract, dazzle, and entrap its prey. Oh! yes. They are some little *Vampires* all by themselves.

But in order to see the phosphorescent glimmer of a fish at a distance, the eyes have been peculiarly modified. The greatest possible number of rays of light given off by a point are absorbed by the eye, and this is effected by either enlarging the eye as a whole or by enlarging only the lens and removing the retina to a distance. In this way the eyes have become cylindrical.

It is not the deep sea fish alone that possess organs of light. Some varieties of fish inhabiting the well lighted part of the ocean have them as well. These, which are commonly called "lantern fish," emit, at rhythmic intervals, a greenish-white light. A shutter, which is an opaque membrane similar to that found on a camera, is pushed or pulled over the light organ. This effectually conceals the rays. Two small varieties comprising the Anomalopidae inhabit the Malay archipelago at the Sunda islands, while a third variety has recently been discovered near Jamaica.

Our front cover shows three very interesting species of deep sea fish. The fish illustrated at the top is *Gigantura chuni, A Br.* The fish in the center with the peculiar elongated nose-piece is *Gigantactis vanhoeffeni, A. Br.* While the bottom fish is *Stylophthalmus pardoxus. A. Br.*

These are not very large fish, as one might think, and the illustrations on our front cover are about half size. In other words, the fish are only about twice as large as shown on our cover. The fish illustrated at the top is also slightly luminous around its body, as can be seen. One of the most curious of these fish without doubt is the middle fish. Why Nature should have equipt it with such a long nose-piece, the end of which is luminous, is not well understood as yet, as we know very little about these fish. The interesting part about the lower fish is that it has luminous organs all along its sides, while the eyes themselves are but slightly luminous. It is curious that the eyes themselves are not in sockets as is usually found the case with nearly all other animals, but that they extend several inches from the head.



[*Editor's Note: The curious deep sea fish shown on our front cover were prepared from color drawings made by Dr. Bade himself. He in turn worked from the actual fish brought from the deep when making his drawings.*]

HOW I INVENTED THE AUDION.

(*Continued from page 820*)

that before long the wireless telephone will be installed on thousands of vessels, supplementing, and in many cases, supplanting the wireless telegraph. In addition there is an enormous number of small vessels where a wireless telephone installation is more feasible.

As indicative of the growth of the Audion Art, the number of patents issued on various devices and circuits dependent thereon, gives a pretty fair key: Up to 1912 there had been issued about 20 patents, all filed subsequent to 1904. To-day there are over 100 United States patents on the Audion Art, and the number is very rapidly growing. Regardless of what name may be applied to the device patented, practically everyone of these patents since 1906 shows the three electrode bulb. They may all therefore be properly described as the outgrowth of the ideas first shown in the audion amplifier—patent No. 841,387.

Altho This Patent Bears the Date of 1910, It Was Originally Filed in 1904, and Is One of the Basic Patents in All Audion Development. It Shows the First Use of Incandescent Filaments in an Enclosed Chamber, and, Moreover, It Includes at Fig. 5 the First Evidence of the Third Electrode or "Grid" Conception. Here, as Will Be Evident, Is the First Plan for Separating the Antenna Circuit from the Local Circuit.

EXPERIMENTAL CHEMISTRY.

(*Continued from page 794*)

cuprous oxid, or gold; *Yellowish-green*, by uranium oxid; *Green*, by chromic or cupric oxids; *Milk or Opal* glass is made by the addition of bone-ash, tin or zinc oxids. The green color of the common window glass or bottle glass is caused by the presence of ferrous oxid in the sand; this discoloration may be removed by addition of manganese dioxid in the make-up. This serves to oxidize the ferrous to ferric oxid, which imparts a yellow tint, being neutralized by the violet produced by the manganese as a complimentary color.

Pure white sand is mixed with the metallic oxids required, in the proportion which experience has shown gives the best results, and some old glass, called "cullet", is added to improve the quality. The mixture is then put into pots as shown in Fig. 159. These pots are made of the most refractory fire-clay, and are placed in a circular furnace with openings thru which the workman can dip his long iron blowpipe into the pots. Fig. 160 shows such a furnace in cross-section.

The fuel now used is mostly gaseous, and an intense heat is maintained for hours, till the substances are completely fused and mixed. The glassworker dips his blowpipe—a hollow iron rod 5 or 6 feet long, into the fused mass, removes a small portion, rolls it on a smooth iron

Mechanical Engineering

Learn at Home!

THE Government and employers everywhere are looking for men with mechanical ability. Splendid salaries and rapid advancement are offered.

There is an easy, delightful way in which you can learn right at home in spare time. For 27 years the International Correspondence Schools have been giving men and women just the training they need for success in mechanical engineering and more than 200 other subjects. Hundreds of thousands have stepped into good positions through I. C. S. help, but never were opportunities so great as now.

Let the I. C. S. help *you*. Choose the work you like best in the coupon below, then mark and mail it today. This doesn't obligate you in the least and it will bring you information that will start you on a successful career. This is your chance. Don't let it slip by. Mark and mail this coupon *now*.

TEAR OUT HERE

CONSULT US When in need of definite and reliable data concerning any trade formula or industrial process. We are ever on the alert and closely following the development of the industrial arts in all its branches. Each formula or process furnished by this Bureau is supplemented by detailed instructions for its manipulation, thereby doing away with any guesswork on the part of the inexperienced person. We also can advise you, if desired, where the ingredients which enter into any process can be obtained.

The formulae listed below will serve briefly to show the field we cover:

1. Process for producing "Verde Antique" or Green Finish on copper, bronze or brass articles.
2. Fire Extinguishing Compound (powder form)
3. Varnish Remover preparation, effective on either wood or metals.
4. Polish for Automobile bodies.
5. Cleaning Compound for wall paper and shades, etc. (block or cake form).
6. Brazing Compound for use in repairing cast-iron parts.

The standard price for each formula issued by us is Thirty-five cents. Letters of inquiry welcomed. Informative literature sent upon request.

$1,000 Reward

Big rewards are frequently offered throughout the country—many are standing right now—for the catching of criminals. Finger print experts have the best chance of winning these great rewards. For the finger print system is the most reliable and effective means of identification known. You can be a finger print expert. Send the coupon and find out how you can master this new and fascinating profession in your spare time at home. Don't miss this big opportunity. Send coupon today and get our free book.

Be a Finger Print Expert!

Not only in the police departments, but in government institutions, banks, railroads, insurance companies and other large industries, finger print systems are being installed under the guidance of finger print experts. You can earn from $25.00 to $50.00 a week. Right now there is an urgent, unfulfilled demand for experts.

FREE Book on Finger Prints

Send the coupon now for our valuable book telling all about finger prints and their uses; and about the big opportunities in the profession. It tells how you can learn in a short time at home. **Special limited offer now.** Get this free book and full particulars while it lasts. Send the coupon at once.

University of Applied Science
Desk 1703, 1772 Wilson Ave., Chicago

Please send me absolutely free and prepaid your new book on finger prints. Also particulars of your special limited offer. I assume no obligations whatever.

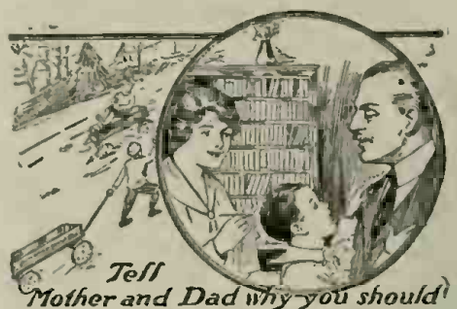
surface, swings it around in the air, blowing meanwhile thru the rod, cuts it with shears, curves and bends it at will, welds it, and thus fashions it as desired into flasks, lamp shades, etc. For such uses as bottles the glass is run into molds. For other purposes, such as lamp bulbs, chemical flasks and apparatus it is blown. For still other kinds it is rolled, as window glass. In order that glass objects will not break easily, they must undergo a process of *annealing*, that is slowly *cooled*, so that the molecules may arrange themselves in a natural way.

Pottery and Porcelain.



Genuine porcelain and chinaware are manufactured from a fine white clay, *Kaolin*,—resulting from the disintegration of feldspathic rocks,—and silica. After being fashioned the porcelain is "fired," then glazed and refired. One mode of glazing consists in dipping the object into a powder of feldspar and silica suspended in vinegar, and then fusing. Jugs, drain pans, and coarse earthenware are glazed by volatilizing sodium chlorid in an oven, which holds the porous material. The glaze goes into the pores of the ware, with which it partially combines to form sodium and aluminum silicates. If on being heated the ware and glaze expand uniformly the glaze will not crack. Flower pots and other porous pottery illustrate clay that has been moulded and baked, *but not glazed*. Bricks are baked clay.

THE ROGERS UNDERGROUND WIRELESS.

(*Continued from page 789*)

mained enthusiastic and sincere in all the tests and installations made of my under-ground radio system thru all the trials and disappointments of its development, even when the system seemed to prove unworkable. Their perseverance and high skill in the radio art has hastened the official endorsement and the installation of the buried and submerged antenna." Commander A. Hoyt Taylor, D.Sc., U. S. N.; Dr. L. W. Austin, of the Bureau of Standards; Admiral Strother Smith, U. S. N.; Commander Hooper, U. S. N.; G. H. Clark, Expert Radio Aid, U. S. N.; Dr. George W. Pierce, of Harvard University; and Ensign A. Crossley, U. S. N., who has been actively engaged on the installation of the Rogers system at the Great Lakes Naval Radio Station, besides New Orleans, New London, Conn. (test station, now abandoned), and Norfolk, Va.

Like many other great inventions the exact mode of operation is hard to ascertain and define. The views of Mr. Rogers on the operation of this wireless system are briefly defined as follows:—First, that the electric energy liberated at the base of an antenna will be propagated thru the earth even in the absence of etheric space waves above, if such a condition were possible, and which in reality does occur when great distances are signalled over, so he believes. Second, that the propagation of earth waves no more depend upon the ether waves above the surface of the earth than these etheric space waves depend upon the earth waves. Further, that both waves are propagated simultaneously, one above and the other below the surface of the earth, and that at the initial start each is dependent upon the other, altho thereafter neither is dependent upon the other. Furthermore, Mr. Rogers believes that the ether waves gradually die out in intensity in proportion to the earth's curvature, and the distance over which they are propagated, and that at great distances the ether space waves do not have any appreciable effect upon receiving appliances, and that these are energized solely by the energy transmitted thru the earth.

Tell Mother and Dad why you should own an **Auto-Wheel**

TELL them that

every real boy should own an Auto-Wheel Coaster or an Auto-Wheel Convertible Roadster because they're the best wagons ever built for work or play. Wheels have roller bearings, steel axles and tires, and the spokes are oval like an auto.

Send for FREE Felt Pennant

Write us the names of three coaster wagon dealers, mentioning which one handles the AUTO-WHEEL, and we'll send you a beautiful Felt Pennant, FREE.

Organize an Auto-Wheel Coaster Club

Each member receives a beautiful cap. The captain receives a special cap. Write now for booklet telling all about the Auto-Wheel Coaster Clubs of the U. S., and how to organize a local branch. Address,

www.americanradiohistory.com

These ground currents travel with the speed of light and are picked up at the receiving station. The space waves persist for an appreciable distance, which accounts for air-plane to air-plane and air-plane-to-earth radio-communciation, but it is the belief of Mr. Rogers that in such long distance radio transmission as half-way around the globe (12,000 miles) that it is the ground wave current that does the work, and that the free space wave above the surface of the earth never reaches the station, due to the high resistance of the atmospheric envelope.

One of the Naval experts present mentioned that it has been found, that the penetration of the ground wave component increases with an increase in wave length. This is an important fact and helps to explain the operation of this new radio system, with its aërials buried in the ground. He also mentioned that "Radio to Mars" or other planets would be impossible, if we are to believe in the well-known "Heaviside" ionization layer, surrounding the earth at a height computed at from 30 to 50 miles, for no etheric wave can pass this layer without being reflected back to the earth, or at least restrained within this passageway.

Rogers System Eliminates "Static" and "Interference".

Mr. Rogers stated that his underground antenna, in itself, did not solve entirely the static or interference problem, but it made the nearest approach to this ideal condition —the goal of all radio engineers—than had ever been accomplisht before. This problem has, thanks to a new arrangement perfected by Commander A. Hoyt Taylor, D.Sc., been solved and *static and interference have been practically totally eliminated, for all-year-around radio service.* Think what an advance this means! Further, *there is no rise and fall in the signal strength during the night or day, at any time of the year, due to the sun's ionization effect, as is the case where elevated antennae are employed.* The U. S. Naval reports and tests made with the Rogers' ground aërial in comparison with the usual form of elevated aërial, several of which are appended herewith, show the incomparable efficiency of this new radio system.

What the Facts Show.

First we will mention the test which Mr. Rogers and a naval officer conducted for the writer. The apparatus used in these tests are shown in the accompanying photographs. They included several large tuning inductances, variable condensers, a one-step audion amplifier (single Audiotron bulb only!) and two pairs of Baldwin 'phones (telephone receivers). This apparatus was connected up to one of Mr. Rogers' latest buried antennas—a single rubber covered, stranded copper cable, about the size of a small ignition cable, extending westward for a distance of 4,000 feet, so as to be in a plane with the high power European radio stations. *This cable is encased in iron pipe (gas pipe)*, each 20 foot section of which is insulated from the abutting sections by means of a rubber hose (garden hose) slipt over the pipe ends for a few inches. This is buried in a dirt trench about 3 feet deep, filled in with soil. The cable is insulated at the free end and is connected up as in Fig. 2. The rubber covered wire alone has been used in all sub-aqueous tests, and gives fine results when simply buried in the ground, the decay not being so rapid as probably would be imagined. This latest aërial in the iron pipe is a new development and experiments are still going on with it. It works wonderfully well. The 4,000 foot aërial here described is best suited to receiving wave lengths of 6,000 to 16,000 meters. For shorter wave lengths aërials of smaller dimensions are employed.

www.americanradiohistory.com

"Here's the 'Lyons' station in France," said Mr. Rogers. A turn of the knob on the specially calibrated condenser, and there was "Lyons" (France)—sure enough. *Static and interference were unheard.* Next the great stations across the broad Atlantic, at Nauen, Germany; Carnarvon, Wales (England); and Rome, Italy, were heard with equal loudness and clarity. This laboratory station, which has been used by the Navy Department during the war, has picked up practically all the high power stations on the globe. American stations were then picked up by changing the wave length, and finally a test was made on a short (250 feet in length) buried ground antenna, adapted to receiving wave lengths of 200 to 800 meters. Wireless telephone messages were picked up from Washington, a distance of about seven miles. It is most interesting to note at this juncture, as the Naval tests at Norfolk, Va., on a similar aërial have shown, that a radio message from an airplane cannot be picked up on the underground aërial, until the 'plane is directly over the station. This would seem to prove two things—first, that the short waves sent out by the airplane radio set do not penetrate into the ground very far, if at all,—and second, that airplane radio transmission and reception are effected solely by etheric waves.

Referring to Figures 3 and 4, we find several interesting points. Fig. 3-A, shows how a double ground aërial is sometimes connected. Also, as in the case of Mr. Rogers' test station, several sets of these buried antennae are best employed, distributed about the station as shown in Fig. 3-B.

The Rogers underground antenna system has been used at the Belmar, N. J., station during the war with most gratifying results, as reported by the Navy Department, and its successful and unfailing operation during the twenty-four hours of the day, resulted in trebling and quadrupling the capacity of this great trans-Atlantic highway of intelligence communication. The official reports in connection with the work accomplished with the underground Rogers system at Belmar state that not a single word of communication was lost during the reception of thousands of important official messages from Europe. The station at Tuckerton, N. J., has also been equipt with the Rogers underground aërial system and all of the larger stations of the Allied Powers in Europe have been copied successfully thru the 24 hours, at this point also.

Submarine Wireless.

Perhaps the most interesting tests of all are those which were made on *submerged* submarines *in salt water!* The aerial in this case was of heavily insulated stranded cable, stretched from stem to stern as Fig. 4-A illustrates. The two aërials were brought down thru the conning tower and joined to the receiving apparatus. A second form of aërial is illustrated at Fig. 4-B, where the insulated aërial wires are placed in iron pipes within the submarine. Here are the results of some of these tests, which do not include the transmitting tests to the submarine, from a ground antenna on shore. When submerged 8 feet, the German station at Nauen was picked up by the submarine while lying off the American coast! *Submarines have, in other official tests, picked up distant stations when submerged 21 feet, on a wave length of* 12,600 *meters or greater wave lengths.*

One of the naval officers, who has had much to do with the testing of the Rogers' system, stated that experience had demonstrated that *in fresh water the submerged antenna may be placed at any depth.* Salt water acts differently, but the aërial may be submerged any desired depth for wave lengths above 10,000 meters.

The same officer, who has made a close study of all American and European work in radio, explained how the best work ever done in radio was accomplisht at the Great Lakes Naval Station, on the shore of Lake Michigan. Fig. 5 gives the general arrangement of this station. The test station was on the beach and acted as a "remote control" station for the standard station at A. The shortest distance between a "receiving and control station" in the naval radio service heretofore has been 36 *miles.* Here a distance of 600 feet only, separate the elevated aërial of the main station from the submerged Rogers antenna terminating at the test station, B. Said he, "Now let the inventors of 'static and interference' preventers trot out their little pets, and show what they can DO! Here's what this station *actually did on schedule service: With* 48 *amperes, at* 4,000 *meters wave length, being radiated in the elevated main antenna—the beach station,* ONLY 600 FEET AWAY, *was picking up Nauen on* 12,600 *meters, and New Orleans on* 5,000 *meters, without any interference or static —all on the Rogers sub-aqueous aërials.* These were rubber-covered cables spreading in different directions, any one of which could be used, and laying 50 feet deep in the water at their outer extremities.

Imagine such a wonderful performance! But this is not all. The official tests show that the station at Cavite, P. I., 8,100 miles away, was received regularly on the Rogers sub-aqueous aërials at the Lake Michigan Station, *on schedule service,* at 11 A. M. and 5:30 P. M. daily, the working periods of that station.

Transmitting On Underground Aerials.

Tests were made by the naval experts, as well as by Mr. Rogers in his very first experiments in transmission from a ground or under-water antenna. *These were all successful.* It is only a matter of properly insulating the antenna so that it will not break down under the high potential applied to it by the transmitter. The early tests by the inventor were made with a one inch spark coil to the Bureau of Standards Radio Laboratory, a distance of seven miles. *the received signals having an audibilty of* 2,000, *i.e.,* 2,000 *times the strength of a clear, readable signal.* The audibility of the signals at the Washington Navy Yard

The Burgess BLUE BOOK

for all Practical Men and Electrical Students

(See review of this book by Editor in December issue of your Electrical Experimenter page 568)

I have prepared a pocket-size note book especially for the practical man and those who are taking up the study of electricity. It contains drawings and diagrams of electrical machinery and connections, over two hundred formulas for calculations, and problems worked out showing how the formulas are used. This data is taken from my personal note book, which was made while on different kinds of work, and I am sure it will be found of value to anyone engaged in the electrical business.

The drawings of connections for electrical apparatus include Motor Starters and Starting Boxes, Overload and Underload Release Boxes, Reversible Types, Elevator Controllers, Tank Controllers, Starters for Printing Press Motors, Automatic Controllers, Variable Field Type, Controllers for Mine Locomotives, Street Car Controllers, Connections for reversing Switches, Motor and Dynamo Rules and Rules for Speed Regulation. Also, Connections for Induction Motors and Starters, Delta and Star Connections and Connections for Auto Transformers, and Transformers for Lighting and Power Purposes. The drawings also show all kinds of lighting circuits, including special controls where Three and Four Way Switches are used.

The work on Calculations consist of Simple Electrical Mathematics, Electrical Units, Electrical Connections, Calculating Unknown Resistances, Calculation of Current in Branches of Parallel Circuits, How to Figure Weight of Wire, Wire Gauge Rules, Ohm's Law, Watt's Law, Information regarding Wire used for Electrical Purposes, Wire Calculations, Wiring Calculations, Illumination Calculations, Shunt Instruments and How to Calculate Resistance of Shunts, Power Calculations, Efficiency Calculations, Measuring Unknown Resistances, Dynamo and Dynamo Troubles, Motors and Motor Troubles, and Calculating Size of Pulleys.

Also Alternating Current Calculations in finding Impedance, Reactance, Inductance, Frequency, Alternations, Speed of Alternators and Motors, Number of Poles in Alternators or Motors, Conductance, Susceptance, Admittance, Angle of Lag and Power Factor, and formulas for use with Line Transformers.

The Burgess BLUE BOOK Will Be Shipped, Postpaid, on Receipt of *$1.00*

was 1,000. The transmitting tests at the Great Lakes Naval Station were made at first with a low power Oscillion bulb transmitter and later with a Clapp-Eastham hytone set. An elevated amateur style antenna of two wires was strung up between two houses 38 miles away. Clear signals were received with an audibility strength of 2,000. The ignition cable used for the aerial finally punctured, but *even then* the signals received were four times louder than the best amateur transmitter could send on a regular aerial, as tests proved.

Official U. S. Naval Tests of Underground Reception, at Naval Station, New Orleans, La., During 1917.

Excerpts.

In general, (relating to the Rogers' system) the point of interest lies in the use of wires buried in the ground, for both the transmitting and the receiving antenna. For instance, in receiving, a wire buried one foot below the surface of the earth extends for several hundred feet south of the receiving station, and a similar wire north, the receiver being located between the pairs of wires. The ordinary receiver was used. With this arrangement, signals from Darien, Nauen, and all Atlantic stations were received.

Tests at New Orleans Station.

Federal receiver used on main antenna, Western Electric receiver used on underground antenna, 1,400 feet buried wire. (The figures refer to audibility.)

	Main Antenna		Underground Antenna		
Station	Wave Length	Sig. aud.	Static aud.	Sig. aud.	Static aud.
San Diego	9800	1200	1000	750	15
Arlington	7500	2000	3000	1500	50

Impossible to read Arlington on the elevated antenna on account of static interference. United Fruit Company station of New Orleans interfered with signals from Arlington on main antenna, *but offered no interference* on underground antenna.

Test on message from U. S. S. "Are-

(*Continued on page* 839)

ALEXANDER WIRELESS BILL IS KILLED.

(*Continued from page* 786)

today we are not at all excited even about the amendment of the Alexander Bill for we have good and sufficient reasons to believe that the Alexander Bill amended has little chance to become a law."

That our judgment was correct is borne out by the fact that the bill was actually killed a month later. Many interesting things came to light during the hearings before Mr. Alexander in the latter part of December. A number of well-meaning amateurs, small and large, professional and otherwise, had flocked to Washington to give testimony and to protest against the Alexander Bill. However, before they arrived in Washington, a flood of protesting letters from amateurs had descended upon the national capital, and it was found that their services were not at all needed, for before their arrival several amendments had already been gotten up and were in print.

It is not our intention to belittle the genuine efforts made by these amateurs who went to Washington in person to fight for the cause, but we do not think that in the testimony given as publisht in the printed records, anything new was shown or any evidence given that was not already known by the Committee. It brought out, however, the interesting fact over and over that the 1912 bill was elastic enough to cover any emergency as far as the radio

We guarantee at any time during the first year of your enrollment to refund the entire amount paid if immediately upon the completion of ten examinations you notify the school you are not satisfied with your Course.

DARE YOU GUARANTEE YOUR SERVICE?

Will you guarantee your service to your employer as we guarantee our service to you? CAN you? Think it over. Think what "absolute satisfaction" means in dollars and cents—*if you can deliver it.* Guaranteed service is simply the difference between "getting by" and GETTING ON. If you are only "getting by," if you aren't increasing your earning power, or if you can't guarantee your service, then you need and should get *specialized training.*

WE GUARANTEE Our Training

Make no mistake about that! When we undertake to make you a skilled worker in your line, we absolutely and unreservedly guarantee to satisfy you insofar as quality and thoroughness of training go. We accept students on no other basis but that of *satisfaction or money back.* 25 years' experience enables us to stand back of our work. We know HOW well enough to guarantee our service to you. You risk nothing by enrolling. You can't lose a cent. Our training will enable you to guarantee your service *because of your training.* That means the position you want, and bigger pay.

Training Decides Pay

There's no question about it. You get paid for what you can DO. That depends on what you KNOW. Increase your knowledge with one of our practical Courses and your earning power increases accordingly. You can train at home in your spare time—backed by the assurance that we guarantee to satisfy you. There are no strings to that offer. Let us send you our Free Bulletin and full details. Check and mail the coupon TODAY.

amateur is concerned, and this is a good thing. We had maintained right along and we stated so in our January and February issues, that no amendment nor new law was at all required. We had no suggestions to make, the old law was good enough, and we said so,—if any change at all was to be made, we were for the Padgett bill, which left the amateur just exactly where he was before the new bill came up. Naturally we are glad to see that our judgment proved right, for official Washington thought so, too. The old law is good enough, it covers every possible phase of the amateur, and we do not think that any legislator could do better than the Radio Act of 1912.

An interesting side light of the disturbed state of mind of the visiting Washington radio amateurs appeared to be their unanimous holy fear of the United States Navy. They all seemed to be obsest, any, panic-struck that the Navy Department was out to kill the amateurs, which as a matter of fact, the Navy, speaking generally, was not.

We believe that our opinion is shared by those who know the inside facts, that the Alexander Bill as originally framed was a hasty measure, because at the time it probably was thought that Government ownership for radio was ripe, and that such a measure could be rushed thru in haste. The sponsors of the bill, however, made two fundamental mistakes: First, the country was and is not ripe for public ownership as yet. Second, it was found that several hundred thousand red-blooded American citizens, better known as Radio Amateurs, cannot be wiped off the earth by means of a blue pencil. Such methods might have had a small chance before the war, but after what we have gone thru in democratizing the world and freedom for everybody, there never was a ghost of a chance of the measure succeeding. Several senators and congressmen voiced their opinion on this point in no uncertain tones, and we are certain that if the bill should come up again during the next few years, which by the way we doubt, it will experience exactly the same fate.

Another mistake, which, however, is made by a great many people outside of Washington is that for some curious reason the amateurs at large has always been looked upon as a boy in his knickers. Even well informed Washington was greatly surprised to receive letters from "young" amateurs 60 and 70 years old, and these "boys" were just as vehement in their protests as the young man of 20. Then the amateurs in uniform were legion, and their parents voiced their sons' sentiments, being that the sons themselves were perhaps in France or elsewhere. Further, the great horde of amateurs known as jewelers made themselves heard lustily.

There are today thousands of jewelers located all over this broad land, whose business it is to serve their community by giving them the right time. They also require daily time signals in their business. This time service was given free to them by Uncle Sam every day by the time signals sent out by Arlington and other powerful Government stations. These amateurs under the original Alexander bill would have been killed just the same as their brethren who pursue wireless more or less for instructional purposes, and you may be sure that these jewelers were loud in their complaints.

Our amateurs are to be congratulated in their solitary fight which they put up for their rights, and we congratulate them upon their thoro victory.

There is, however, one serious point which we desire to broach, and that is the following:

When we first heard that a new wireless measure was to be rushed thru Congress,—which if it had actually past, would have killed American radio amateurism,—we took it up ourselves to broach the important news to every amateur on record.

The RADIO LEAGUE OF AMERICA, which was organized three years ago was formed for just such a purpose, viz., to keep the amateurs together and to ward off unfair legislation. Unfortunately, only about 20,000 amateurs had been registered with the League, altho it does not cost one cent to join the League. So when we came to write the letters to all the amateurs we only had 20,000 names of the League, while the other names were made up from various lists which we had in our office, and which lists were not at all reliable on account of removals of amateurs, etc.

We wish to take this occasion to urge every amateur to fill out the blank printed at the end of this article and join the League at once. *It does not cost a cent to do so,* except three-cent postage with which to mail this blank. You immediately become a member, and any important news can then be transmitted to you immediately without delay. It should be apparent to every amateur that being a member of the *Radio League of America* can only benefit him, and inasmuch as there are no dues or fees to be paid, there is absolutely no good reason why every amateur should not be in it.

Peace will soon be declared by the President and then everybody will be allowed again to operate his or their stations, and being a member in this well-established League of national scope and reputation can only benefit the owner of the radio station. Then, too, every amateur owes it to his Government that in time of peril his services can be drawn upon and his station used, and only by having a central body which has all such information can radio amateurism in the United States grow to its fullest and greatest importance.

Application for Membership in the Radio League of America

I, THE UNDERSIGNED, a Radio Amateur, am the owner of a Wireless Station. My station has been in use since..... and I herewith desire to apply for membership in the RADIO LEAGUE OF AMERICA. I understand that the Radio League of America is a National Scientific Organization for the pursuit of the Radio Arts. I will not be called upon to pay membership fees, or dues, and once enrolled I am to share in all the privileges of a regular member.

Upon receipt of this form properly filled out you are to send me your eight-page booklet describing the purpose of the League, rules, etc.

Name.....

City.....

State.....

Date.....191

Mail this blank to Radio League of America, 231 Fulton St., New York City.

Editor, ELECTRICAL EXPERIMENTER,
233 Fulton Street,
New York, N. Y.

SIR:

It has been noted by this office that on page 707 of the February issue of the "Electrical Experimenter" you printed certain proposed amendments to a bill for Government Ownership of Radio Communication. On page 735 in an article entitled "Radio Amateurs Discussed Officially" you stated that this amendment was drafted by Lieutenant J. C. Cooper, Jr., U. S. N. R. F. You have evidently been misinformed. The amendment printed by you was not drafted by the Navy Department and was not discussed before the House Committee at the hearings.

The amendment actually drafted by Lieutenant Cooper and discussed before the Committee appears in the testimony of Captain Todd on page 39 of the Official Report of the Hearings before the House Committee on Merchant Marine and Fisheries on H. R. 13159, and is as follows:

"Insert after line 6, page 2, the following:

" 'The term "amateur station" means a station used for private practice or experiment in radio communication and not operated for profit in either receiving or sending radio signals.'

"Insert in line 14, page 2, after 'training-school stations' the following: 'and amateur stations.'

"Strike out the sentence beginning in line 1, page 3, and ending in line 6, page 3, and in lieu thereof insert the following:

" 'This section shall not apply to stations belonging to the Government of the United States or the Government of the Philippine Islands, or to experiment stations, technical and training-school stations, and amateur stations, licensed as provided by the act to regulate radio communication, approved August thirteenth, nineteen hundred and twelve: *Provided*, That when such amateur stations are licensed for receiving purposes only no operator's license shall be required for the operator in charge of or operating such station; but when such amateur station is licensed for transmitting also the license shall require that the operator of such station shall hold a license showing his ability to send and receive at least twenty-five words per minute in the Continental Morse code: *And further provided*, That the license for such transmitting station may limit the power input to one-half kilowatt in case of amateur stations within one hundred miles of the Atlantic or Pacific Ocean, the Gulf of Mexico, or the Great Lakes, and to one-quarter kilowatt within five miles of a Government receiving station. Amateur stations so licensed shall not use any wave length exceeding two hundred and fifty meters nor less than one hundred and fifty meters except by special authority in the license contained.' "

In order that the information given your readers may be correct, it is requested that you publish this letter in your March issue of the "Electrical Experimenter."

For your further information, there is being forwarded to you under separate cover a full printed copy of the Hearings before the Committee.

Very respectfully,
(Signed) E. B. WOODWORTH,
Commander, U. S. Navy,
Acting Director Naval Communications.

The amendment drafted by Lieutenant Cooper was scheduled to run in our February issue. At the last moment, due to lack of space, it was crowded out. The amendment printed in our February issue was proposed by Mr. Watson as published by us.—Editor.

MAKE MONEY
REPAIRING TIRES

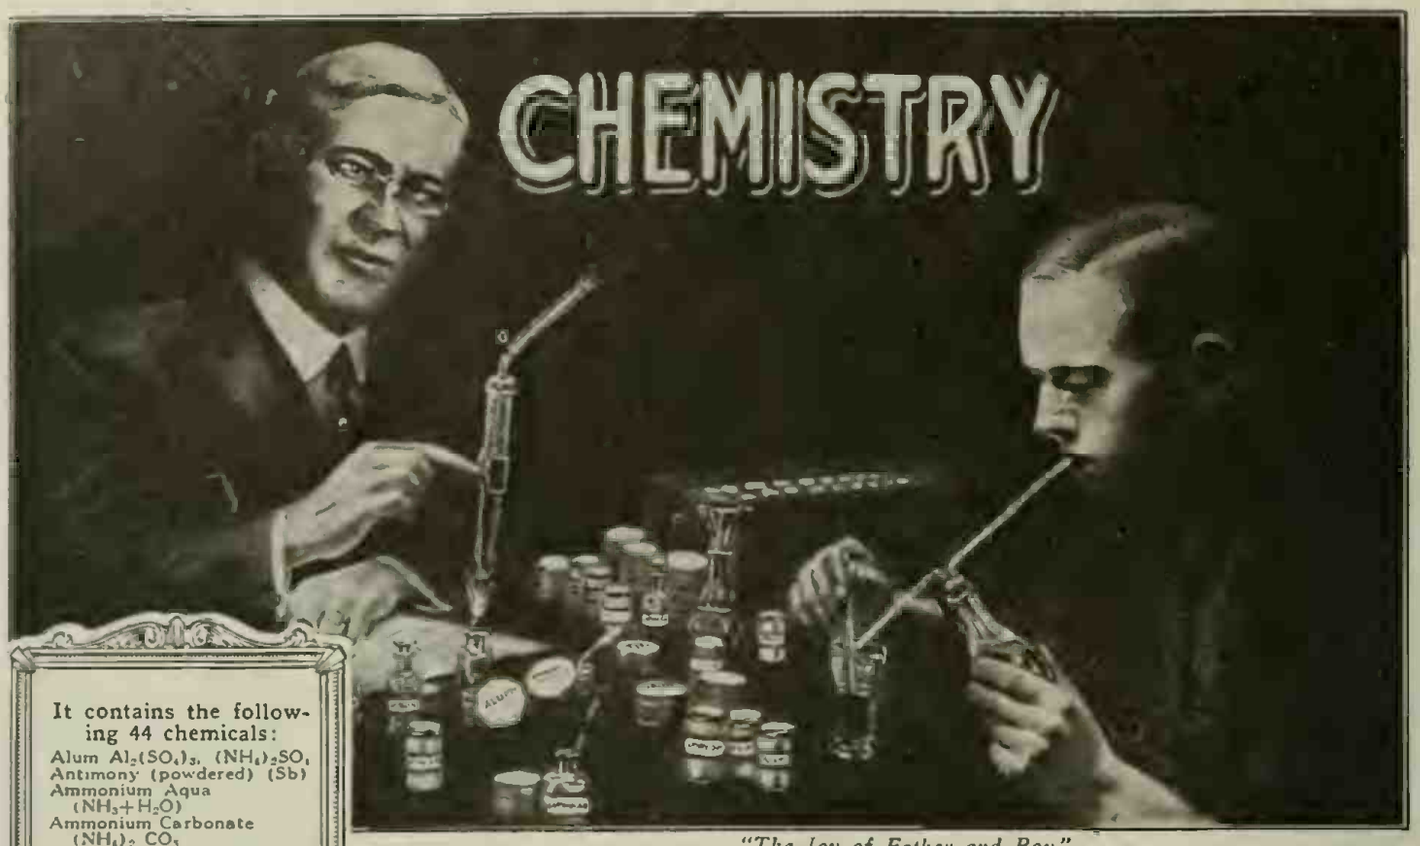
The high cost and limited supply of tires makes it necessary for motorists to conserve their tires and get maximum mileage. Present conditions offer tire repair men a big opportunity to make money. Experienced help not necessary.

With this Shaler Electric Vulcanizer you can make money easy. It heats from city electric light current —*has automatic heat control*—no danger of fire or explosions.

Will mend any style or size of tire—both casing and inner tube. Handles 12 casings and 200 tubes a day. Anybody can operate it, and turn out perfect work. Price $65.00 complete —Subject to Trade Discount.

Write at once for catalog of our complete line of Shaler Vulcanizers. Steam or Electric for Repair Shops and quick selling models for motorists.

C. A. SHALER CO., 2202 Fourth St., Waupun, Wis.



TYPEWRITER SENSATION
PROMPT SHIPMENT.

$4.00 per month buys a beautifully reconstructed, latest model visible typewriter, with back spacer, decimal tabulator, two-color ribbon, etc. Every late style feature and modern operating device. Sent on approval. Catalogue and special prices free.

Harry A. Smith, 738, 218 N. Wells St., Chicago, Ill.

"The Joy of Father and Boy."

THE E. I. Co. CHEMICAL LABORATORY

We present herewith to our friends our new **E. I. Co. Chemical Laboratory** which contains real chemicals and apparata to perform real chemical experiments. This outfit is not a toy, put up merely to amuse, but a practical laboratory set, with all the chemicals, apparata and reagents necessary to perform real work and to teach the beginner all the secrets of inorganic chemistry. With this outfit we give free a book containing a **Treatise in Elementary Chemistry, useful data and recipes, and 100 instructive and amusing experiments.**

It contains the following 44 chemicals:

Alum $Al_2(SO_4)_3$, $(NH_4)_2SO_4$
Antimony (powdered) (Sb)
Ammonium Aqua (NH_3+H_2O)
Ammonium Carbonate $(NH_4)_2\ CO_3$
Ammonium Chloride (NH_4Cl)
Ammonium Sulphate $(NH_4)_2\ SO_4$
Barium Chloride ($BaCl_2$)
Boric Acid (H_3BO_3)
Brimstone (Sulphur) (S)
Calcium Chloride ($CaCl_2$)
Calcium Oxide (CaO)
Calcium Sulphate ($CaSO_4 2H_2O$)
Charcoal (Carbon) (C)
Chloride of Zinc ($ZnCl_2$)
Copper Sulphate ($CuSO_4$)
Ferrous Sulphate ($FeSO_4$)
Ferrous Sulphide (FeS)
Glycerol (Glycerine) $C_3H_5(OH)_3$
Hydrochloric Acid (HCl)
Iodine (I)
Iron Chloride ($FeCl_2$)
Iron Oxide (Fe_2O_3)
Lead Acetate Pb $(C_2H_3O_2)_2$
Litmus Paper
Magnesium Carbonate ($MgCO_3$)
Manganese Dioxide (MnO_2)
Mercury (Quicksilver) (Hg)
Nickel Chloride ($NiCl_2$)
Oxalic Acid ($H_2C_2O_4$)
Sodium Bicarbonate ($NaHCO_3$)
Sodium Borate ($NaBO_2$)
Sodium Carbonate (Na_2CO_3)
Sodium Chloride (NaCl)
Sodium Nitrate ($NaNO_3$)
Sodium Phosphate (Na_2HPO_4)
Sodium Sulphate (Na_2SO_4)
Sodium Sulphite (Na_2SO_3)
Stannous Chloride ($SnCl_2$)
Sulphate of Nickel ($NiSO_4$)
Sulphate of Zinc ($ZnSO_4$)
Sulphuric Acid (H_2SO_4)
Tin (Granulated) (Sn)
Zinc (Metal) (Zn)
Zinc Carbonate ($ZnCO_3$)

The following apparata are furnished:

One Standard Washbottle
One Alcohol Lamp
One Conical Glass Measure
One Erlenmeyer Flask
One Glass Funnel
One Delivery Tube
Six Assorted Test-Tubes
One Test-Tube Holder
Ten Sheets of Filter Paper
One Glass Dropper
One Spoon Measure
Glass Tubing
One book containing Treatise on Elementary Chemistry and 100 Chemical Experiments to be performed with this outfit.

DESCRIPTION OF THE OUTFIT:

The outfit consists of forty-four (44) Chemicals all C. P. (chemical pure) put up in appropriate wooden boxes, glass bottles, and hermetically closed jars. The acids are put up in glass bottles, with ground-in glass stoppers and there is a sufficient quantity of chemicals supplied (mostly one to two ounces) enough to make dozens of experiments with each. See list of Chemicals herewith.

The apparata furnished are all of the best obtainable make and of standard laboratory size and shape. A list of the 17 pieces of apparata furnished with this outfit is printed also herewith.

The Instruction book is a real Chemistry Course for the Beginner.

Some of the Contents are: Division of Matter: This is a Treatise on Elementary Chemistry and deals with the theory of the Elements, Molecules and Atoms, etc.

Chemical Nomenclature. This explains in simple language the derivation of the chemical names of the Elements and their compounds.

There is a chapter on Laboratory Operations; Glass Working; First Aid; Fire Extinguishers; Experimenters Aphorisms, etc.

A good part of the book is devoted to:

Weights and Measures. The Metric System, the English system and the U. S. system are fully explained.

The following tables are furnished:

Symbols and Atomic weights of the Elements.

Measures of Weights, Volume, Capacity and Length.

Per Cent solutions.

Conversion of Measure expressed in parts.

Poisons and their antidotes.

Technical and common name of chemical substances.

Formulas for Cleaning various substances, etc., etc.

Among the 100 Experiments are:

How to make chemical tricks; How to make invisible and magic inks; How to test flour; How to test soil; How to make Chlorine Gas and smoke (German War Gas); How to bleach cloth and flowers. How to produce Oxygen and Hydrogen; How to make chemical colors; How to test Acids and Alkalies and hundreds of interesting hints and formulas.

Altho all chemicals have nearly doubled in price, we have decided not to raise the price of this outfit for the present.

The price is still $5.00

Shipping Weight 10 lbs.

THE ROGERS UNDERGROUND WIRELESS.

(*Continued from page* 835)

thusa" at sea about 150 miles from New Orleans.

Main Antenna		Underground Antenna (500' composite)	
Sig	Static	Sig	Static
400	5000	300	15

The "Arethusa" had been trying to get thru a naval despatch which could not be copied on elevated antenna on account of serious static interference. The despatch was taken on the underground antenna, and *every word copied correctly.*

At 9 P. M., April 7, 1917, it was possible to copy signals from Tuckerton with ease, while static on the elevated antenna made it impossible to read any arc signals.

The following results were obtained with spark signals:

Three hundred foot wires in parallel, ten feet apart, a .002 m.f. condenser in series with primary coil of a Telefunken receiver to obtain 600 meters.

Date	Station	W. L.	Sig. Aud Ground Antenna	Static Aud Ground Antenna	Sig Aud Main Antenna	Static Aud Main Antenna
Apr. 2	Point Isabel	600	15			
Apr. 2	Tampa	600	200	0		3000
Apr. 2	Port Arthur	600	150	0		3000
Apr. 2	Pensacola	1200	20	0	100	150
Apr. 2	Ft. Sam Houston		150			

Of particular interest is the fact that when static *prevents* reception on the main antenna, reception can be continued on the underground antenna. *This has even been done during a severe lightning storm, when the main antenna would have been dangerous without grounding.* Reception is also directional and permits of avoiding interference to some extent by using wire "off direction" of an interfering station.

Strays: Strays are as a rule practically absent. Occasional loud cracks widely separated are received. (Ed. note. This has since been overcome.) These isolated strays, altho frequently loud, do not interfere in the least with the reception of signals. On two occasions, strays have risen to an audibility in excess of 5,000 on these separate cracks, but even in this case, reception of signals, altho a little difficult, *was not interrupted.* On these two occasions it was necessary to *ground* both of the (elevated) aërials at the main station.

Considering the matter of strays, it can be said that on four or five occasions during one week, which was one marked by tremendous storms in the Great Lakes region, that strays rose to an audibility in excess of 10,000 at the beach station. Even in this case, however, signals from boats within 100 miles and from shore stations, such as Ludington, Milwaukee and Manitowoc, were usually readable, because the strays while very loud, were nowhere near as numerous as on the elevated aërial. Durthese periods a messenger was kept at the beach station to carry up messages to the main station, which could not receive these signals on account of the strays.

There seems to be no appreciable advantage in using more than one wire—No. 12 weather proof insulated.

The experiments at Great Lakes confirm the work of the Bureau of Standards on the importance of adequate insulation of the wire. If the wires are grounded at the ends, it does not necessarily make much difference unless they are adjusted to the optimum wire length; but if properly adjusted to this length, grounding of the wires, either intentionally or accidentally, produces a diminuation of the signals, which, however, even with the intentional grounding of the two ends, still leaves them 50% of their maximum value. Therefore, while the question of insulation is important, it does not mean that the system will fail entirely if the insulation becomes faulty.

MY INVENTIONS.

(*Continued from page* 776)

cover. Suddenly my legs went up in the air. In the same instant there was a flash in my brain, the nerves responded, the muscles contracted, I swung thru 180 degrees and landed on my hands. I resumed my walk as tho nothing had happened when the stranger caught up with me. "How old are you?" he asked, surveying me critically. "Oh, about fifty-nine," I replied. "What of it?" "Well," said he, "I have seen a cat do this but never a man." About a month since I wanted to order new eyeglasses and went to an oculist who put me thru the usual tests. He lookt at me incredulously as I read off with ease the smallest print at considerable distance. But when I told him that I was past sixty he gasped in astonishment. Friends of mine often remark that my suits fit me like gloves but they do not know that all my clothing is made to measurements which were taken nearly 35 years ago and never changed. During this same period my weight has not varied one pound.

In this connection I may tell a funny story. One evening, in the winter of 1885, Mr. Edison, Edward H. Johnson, the President of the Edison Illuminating Company, Mr. Batchellor, Manager of the works, and myself entered a little place opposite 65 Fifth Avenue where the offices of the company were located. Someone suggested guessing weights and I was induced to step on a scale. Edison felt me all over and said: "Tesla weighs 152 lbs. to an ounce," and he guest it exactly. Stript I weighed 142 lbs. and that is still my weight. I whispered to Mr. Johnson: "How is it possible that Edison could guess my weight so closely?" "Well," he said, lowering his voice, "I will tell you, confidentially, but you must not say anything. He was employed for a long time in a Chicago slaughter-house where he weighed thousands of hogs every day! That's why." My friend, the Hon. Chauncey M. Depew, tells of an Englishman on whom he sprung one of his original anecdotes and who listened with a puzzled expression but—a year later—laughed out loud. I will frankly confess it took me longer than that to appreciate Johnson's joke.

Now, my well being is simply the result of a careful and measured mode of living and perhaps the most astonishing thing is that three times in my youth I was rendered by illness a hopeless physical wreck and given up by physicians. More than this, thru ignorance and lightheartedness, I got into all sorts of difficulties, dangers and scrapes from which I extricated myself as by enchantment. I was almost drowned a dozen times; was nearly boiled alive and just mist being cremated. I was entombed, lost and frozen. I had hair-breadth escapes from mad dogs, hogs, and other wild animals. I past thru dreadful diseases and met with all kinds of odd mishaps and that I am hale and hearty today seems like a miracle. But as I recall these incidents to my mind I feel convinced that my preservation was not altogether accidental.

An inventor's endeavor is essentially lifesaving. Whether he harnesses forces, improves devices, or provides new comforts and conveniences, he is adding to the safety of our existence. He is also better qualified than the average individual to protect himself in peril, for he is observant and resourceful. If I had no other evidence that I was, in a measure, possest of such qualities I would find it in these personal experiences. The reader will be able to judge for himself if I mention one or two instances. On one occasion, when about 14 years old, I wanted to scare some friends who were bathing with me. My plan was to dive under a long floating structure and slip out quietly at the other end. Swimming and diving came to me as naturally as to a

LISTEN TO ME!

Be A CERTIFICATED ELECTRICIAN

THIS IS YOUR CHANCE OF A LIFE TIME

I am Chief Engineer of the great Chicago Engineering Works. I am in close official touch with the electrical world. I know how badly we need trained electricians who can take charge of important work as experts. Right now there is such a need for executive electricians that I am making a special effort to help meet the demand. I am publishing this special announcement to secure a certain number of ambitious men whom I will personally train by mail for the wonderful opportunities that are open.

I WILL MAKE YOU a Trained Electrician

I don't care how young or old you are, just as long as you can read and write and have a spark of ambition. I don't care where you live or what you do. I don't care if you don't know a blessed thing about electricity. Just give me a little of your spare time for a short period and I'll show you the quick way to success in electricity. You can qualify to earn **$36 to $100 a week** with opportunities for greater earnings.

I Train You by Mail!

Your spare time will do. No interference with your regular duties. I understand just what you must know and I have devised a wonderful way of instructing by mail. I positively guarantee your satisfaction.

Free Wonderful Electrical Outfit

Absolutely free. Not a penny cost to you now or later. To those who act at once I will give a wonderful set of Electrical Equipment with my compliments. Write me at once. I have only a limited number of sets to be given free. Drop me a post card or letter.

Write! You will have to act quick to get in on this opportunity. Write me today for full particulars. Drop me a post card. ***Write Now.***

BE A BOY CHEMIST

Test water, foods and other things you use and wear. Make soap, ink, dye; fire-proof cloth and wood, and work hundreds of useful, fascinating experiments just like a real chemist. Perform weird, puzzling tricks of chemical magic. You can, with "CHEMCRAFT". Outfits contain all chemicals and laboratory supplies to work each experiment many times; also a Manual of Instruction. "CHEMCRAFT" is absolutely harmless; made by a practical chemist and is scientifically correct.

Chemcraft No. 1—$1.50
West of Mississippi River and in Canada—$2.00
Chemcraft No. 2—$3.00
West of Mississippi River and in Canada—$3.50
Chemcraft No. 3—$5.00
West of Mississippi River and in Canada—$6.00

Be sure you get "CHEMCRAFT," the original and most complete and scientific chemical outfit. Ask for it by name at your Toy Store, or send price and we will deliver direct prepaid.

duck and I was confident that I could perform the feat. Accordingly I plunged into the water and, when out of view, turned around and proceeded rapidly towards the opposite side. Thinking that I was safely beyond the structure, I rose to the surface but to my dismay struck a beam. Of course, I quickly dived and forged ahead with rapid strokes until my breath was beginning to give out. Rising for the second time, my head came again in contact with a beam. Now I was becoming desperate. However, summoning all my energy, I made a third frantic attempt but the result was the same. The torture of suppressed breathing was getting unendurable, my brain was reeling and I felt myself sinking. At that moment, when my situation seemed absolutely hopeless, I experienced one of those flashes of light and the structure above me appeared before my vision. I either discerned or guest that there was a little space between the surface of the water and the boards resting on the beams and, with consciousness nearly gone, I floated up, prest my mouth close to the planks and managed to inhale a little air, unfortunately mingled with a spray of water which nearly choked me. Several times I repeated this procedure as in a dream until my heart, which was racing at a terrible rate, quieted down and I gained composure. After that I made a number of unsuccessful dives, having completely lost the sense of direction, but finally succeeded in getting out of the trap when my friends had already given me up and were fishing for my body.

That bathing season was spoiled for me thru recklessness but I soon forgot the lesson and only two years later I fell into a worse predicament. There was a large flour mill with a dam across the river near the city where I was studying at that time. As a rule the height of the water was only two or three inches above the dam and to swim out to it was a sport not very dangerous in which I often indulged. One day I went alone to the river to enjoy myself as usual. When I was a short distance from the masonry, however, I was horrified to observe that the water had risen and was carrying me along swiftly. I tried to get away but it was too late. Luckily, tho, I saved myself from being swept over by taking hold of the wall with both hands. The pressure against my chest was great and I was barely able to keep my head above the surface. Not a soul was in sight and my voice was lost in the roar of the fall. Slowly and gradually I became exhausted and unable to withstand the strain longer. Just as I was about to let go, to be dashed against the rocks below, I saw in a flash of light a familiar diagram illustrating the hydraulic principle that the pressure of a fluid in motion is proportionate to the area exposed, and automatically I turned on my left side. As if by magic the pressure was reduced and I found it comparatively easy in that position to resist the force of the stream. But the danger still confronted me. I knew that sooner or later I would be carried down, as it was not possible for any help to reach me in time, even if I attracted attention. I am ambidextrous now but then I was left-handed and had comparatively little strength in my right arm. For this reason I did not dare to turn on the other side to rest and nothing remained but to slowly push my body along the dam. I had to get away from the mill towards which my face was turned as the current there was much swifter and deeper. It was a long and painful ordeal and I came near to failing at its very end for I was confronted with a depression in the masonry. I managed to get over with the last ounce of my force and fell in a swoon when I reached the bank, where I was found. I had torn virtually all the skin from my left side and it took several weeks before the fever subsided and I was well. These are only two

HEL-MET THE KAISER

Send one to your boy in camp; all the boys will want them. Anyone against the Kaiser or Germany should wear this pin. Same size as picture. Handsome metal, black letters. Will wear for years. Men and women wear them — causes laughter wherever seen.

Price 10 Cents

Voice Thrower 10c

Learn to throw your voice into a TRUNK, under the bed, out in the hall or anywhere. Lots of FUN fooling the Teacher, Janitor, Policeman, Parents, Neighbors, or Friends.

THE VENTRILO

is a little instrument that fits into the mouth out of sight. BOYS or GIRLS can use it. NEVER FAILS! A 32-page book on Ventriloquism sent with the VENTRILO for TEN Cents.

NEW FORD JOKE BOOK 1919

All the latest jokes on the Ford auto. Hundreds of them, and all good ones. Spring a new one on your neighbors.

Large book with colored cover by mail, 10c.

Devil Resigns to the Kaiser

Everyone who reads this book is wild over it. Contains the following:—The Kaiser's Dream, A Letter from the Devil to the Kaiser, Kaiser's Prayer, How Satan Resigns to the King of Devils, The Kaiser, etc. Many other stories, jokes, etc., about the German Emperor. Book mailed 10 cents, postage 2 cents extra.

ROGEN X-RAY

Price 10 Cents

HERE, BOYS, is just what you want. With this instrument you can apparently see through clothes, see the bones in your fingers. Think of the fun you can have with it. Sample, by mail, TEN CENTS.

SKULL RING

Here is a handsome, up-to-date Ring, representing a Skull and Cross-bones. Has stones in the eyes and looks something frightful. Women won't like it, but for men or boys it is a great novelty. Sample, by mail, 15c.

Gee! What a Wad!

This is STAGE MONEY

Looks like the GENUINE STUFF. Some Green backs and some Yellow backs. Create a BIG sensation among your friends. The girls will all be after you when they see the wad. BIG roll of 15 pieces by mail, 10 cents.

Boys Own Toy Maker

and Nine Other Books for 10c

Tells how to make a Telephone, Magic Lantern, Kites, Sail Boat, Stilts, Electric Telegraph, Pop Gun, Red Fire, Galvanic Battery and many other things. This book, with nine other interesting books, mailed for 10c.

ENCHANTED BARREL

The Most Wonderful Pocket Trick Made

CHANGE A CENT INTO A DIME

Ask your friend to drop a dime in the barrel. When he takes it out, Behold! It is a CENT. You make 9 cents every time you fool them. Never fails. They cannot get on to it. Sample barrel, with directions, only.... 10c

Any three of the above articles for 25c or any six for 50c

Royal Novelty Co. 250 EAST AVENUE SOUTH NORWALK, CONN.

Better Your Position

Prepare for a permanent position. Railway Traffic Inspectors are always in line for advancement. No age limit—only common school education. Mighty good salary and expenses. A Railway Traffic Inspector safeguards the lives of the public and protects his company's interests—an important position. He's paid to travel and observe. Works only with railroad officials—that's why he's bound to gain a position of trust. Hundreds needed right now—thousands later. Study for only three months—we'll arrange for the position. Delay never secured anyone a better position—so act immediately. Booklet D 21 tells all—write today. Address

of many instances but they may be sufficient to show that had it not been for the inventor's instinct I would not have lived to tell this tale.

Interested people have often asked me how and when I began to invent. This I can only answer from my present recollection in the light of which the first attempt I recall was rather ambitious for it involved the invention of an *apparatus* and a *method*. In the former I was anticipated but the latter was original. It happened in this way. One of my playmates had come into the possession of a hook and fishing-tackle which created quite an excitement in the village, and the next morning all started out to catch frogs. I was left alone and deserted owing to a quarrel with this boy. I had never seen a real hook and pictured it as something wonderful, endowed with peculiar qualities, and was despairing not to be one of the party. Urged by necessity, I somehow got hold of a piece of soft iron wire, hammered the end to a sharp point between two stones, bent it into shape, and fastened it to a strong string. I then cut a rod, gathered some bait, and went down to the brook where there were frogs in abundance. But I could not catch any and was almost discouraged when it occurred to me to dangle the empty hook in front of a frog sitting on a stump. At first he collapsed but by and by his eyes bulged out and became bloodshot, he swelled to twice his normal size and made a vicious snap at the hook. Immediately I pulled him up. I tried the same thing again and again and the method proved infallible. When my comrades, who in spite of their fine outfit had caught nothing, came to me they were green with envy. For a long time I kept my secret and enjoyed the monopoly but finally yielded to the spirit of Christmas. Every boy could then do the same and the following summer brought disaster to the frogs.

In my next attempt I seem to have acted under the first instinctive impulse which later dominated me—to harness the energies of nature to the service of man. I did this thru the medium of May-bugs—or June-bugs as they are called in America—which were a veritable pest in that country and sometimes broke the branches of trees by the sheer weight of their bodies. The bushes were black with them. I would attach as many as four of them to a cross-piece, rotably arranged on a thin spindle, and transmit the motion of the same to a large disc and so derive considerable "power." These creatures were remarkably efficient, for once they were started they had no sense to stop and continued whirling for hours and hours and the hotter it was the harder they worked. All went well until a strange boy came to the place. He was the son of a retired officer in the Austrian Army. That urchin ate May-bugs alive and enjoyed them as tho they were the finest blue-point oysters. That disgusting sight terminated my endeavors in this promising field and I have never since been able to touch a May-bug or any other insect for that matter.

After that, I believe, I undertook to take apart and assemble the clocks of my grandfather. In the former operation I was always successful but often failed in the latter. So it came that he brought my work to a sudden halt in a manner not too delicate and it took thirty years before I tackled another clockwork again. Shortly thereafter I went into the manufacture of a kind of pop-gun which comprised a hollow tube, a piston, and two plugs of hemp. When firing the gun, the piston was prest against the stomach and the tube was pushed back quickly with both hands. The air between the plugs was comprest and raised to high temperature and one of them was expelled with a loud report. The art consisted in selecting a tube of the proper taper from the hollow stalks which were

(Continued on page 843)

Moving Picture Machine

A REAL moving picture machine that uses the same films as the big movie theaters all over the country and you can get it ***absolutely free*** with a box of film besides.

FREE

Have a movie show right in your own home. Entertain your friends and relatives. Charge admission and make easy spending money. You never had a chance like this before and it may not be repeated again. Send your name on the coupon NOW!

Boys! Girls! Act Quick!

Send your name on the coupon below or a post card will do—but you must do this right now, this very minute. I will send you 12 beautifully colored patriotic pictures. Every one who sees them wants them. Full of action, showing our brave soldiers and sailors performing their heroic duties in the trenches and at home. All you have to do is distribute these pictures on a special 35c offer among the people you know. This will take you just a few hours. They go like hot cakes, everybody wants them. When you have distributed the 12 pictures I will immediately send you FREE and Prepaid this Genuine Moving Picture Machine Complete with a box of film. Don't miss this wonderful offer.

Send This Coupon Right NOW!

Don't wait another minute. It may be too late if you wait. Send your name on a postal card if you want to—but do it right now—AT ONCE!

MY INVENTIONS

(*Continued from page* 841)

did very well with that gun but my activities interfered with the window panes in our house and met with painful discouragement. If I remember rightly, I then took to carving swords from pieces of furniture which I could conveniently obtain. At that time I was under the sway of the Serbian national poetry and full of admiration for the feats of the heroes. I used to spend hours in mowing down my enemies in the form of corn-stalks which ruined the crops and netted me several spankings from my mother. Moreover these were not of the formal kind but the genuine article.

I had all this and more behind me before I was six years old and had past thru one year of elementary school in the village of Smiljan where I was born. At this juncture we moved to the little city of Gospic nearby. This change of residence was like a calamity to me. It almost broke my heart to part from our pigeons, chickens and sheep, and our magnificent flock of geese which used to rise to the clouds in the morning and return from the feeding grounds at sundown in battle formation, so perfect that it would have put a squadron of the best aviators of the present day to shame. In our new house I was but a prisoner, watching the strange people I saw thru the window blinds. My bashfulness was such that I would rather have faced a roaring lion than one of the city dudes who strolled about. But my hardest trial came on Sunday when I had to dress up and attend the service. There I met with an accident, the mere thought of which made my blood curdle like sour milk for years afterwards. It was my second adventure in a church. Not long before I was entombed for a night in an old chapel on an inaccessible mountain which was visited only once a year. It was an awful experience, but this one was worse. There was a wealthy lady in town, a good but pompous woman, who used to come to the church gorgeously painted up and attired with an enormous train and attendants. One Sunday I had just finished ringing the bell in the belfry and rushed downstairs when this grand dame was sweeping out and I jumped on her train. It tore off with a ripping noise which sounded like a salvo of musketry fired by raw recruits. My father was livid with rage. He gave me a gentle slap on the cheek, the only corporal punishment he ever administered to me but I almost feel it now. The embarrassment and confusion that followed are indescribable. I was practically ostracised until something else happened which redeemed me in the estimation of the community.

An enterprising young merchant had organized a fire department. A new fire engine was purchased, uniforms provided and the men drilled for service and parade. The engine was, in reality, a pump to be worked by sixteen men and was beautifully painted red and black. One afternoon the official trial was prepared for and the machine was transported to the river. The entire population turned out to witness the great spectacle. When all the speeches and ceremonies were concluded, the command was given to pump, but not a drop of water came from the nozzle. The professors and experts tried in vain to locate the trouble. The fizzle was complete when I arrived at the scene. My knowledge of the mechanism was nil and I knew next to nothing of air pressure, but instinctively I felt for the suction hose in the water and found that it had collapsed. When I waded in the river and opened it up the water rushed forth and not a few Sunday clothes were spoiled. Archimedes running naked thru the streets of Syracuse and shouting Eureka at the top of his voice did not make a greater impression than myself. I was carried on the shoulders and was the hero of the day.

Upon settling in the city I began a four-years' course in the so-called Normal School preparatory to my studies at the College or *Real-Gymnasium*. During this period my boyish efforts and exploits, as well as troubles, continued. Among other things I attained the unique distinction of champion crow catcher in the country. My method of procedure was extremely simple. I would go in the forest, hide in the bushes, and imitate the call of the bird. Usually I would get several answers and in a short while a crow would flutter down into the shrubbery near me. After that all I needed to do was to throw a piece of cardboard to detract its attention, jump up and grab it before it could extricate itself from the undergrowth. In this way I would capture as many as I desired. But on one occasion something occurred which made me respect them. I had caught a fine pair of birds and was returning home with a friend. When we left the forest, thousands of crows had gathered making a frightful racket. In a few minutes they rose in pursuit and soon enveloped us. The fun lasted until all of a sudden I received a blow on the back of my head which knocked me down. Then they attacked me viciously. I was compelled to release the two birds and was glad to join my friend who had taken refuge in a cave.

In the schoolroom there were a few mechanical models which interested me and turned my attention to water turbines. I constructed many of these and found great pleasure in operating them. How extraordinary was my life an incident may illustrate. My uncle had no use for this kind of pastime and more than once rebuked me. I was fascinated by a description of Niagara Falls I had perused, and pictured in my imagination a big wheel run by the Falls. I told my uncle that I would go to America and carry out this scheme. Thirty years later I saw my ideas carried out at Niagara and marveled at the unfathomable mystery of the mind.

I made all kinds of other contrivances and contraptions but among these the arbalists I produced were the best. My arrows, when shot, disappeared from sight and at close range traversed a plank of pine one inch thick. Thru the continuous tightening of the bows I developed skin on my stomach very much like that of a crocodile and I am often wondering whether it is due to this exercise that I am able even now to digest cobble-stones! Nor can I pass in silence my performances with the sling which would have enabled me to give a stunning exhibit at the Hippodrome. And now I will tell of one of my feats with this antique implement of war which will strain to the utmost the credulity of the reader. I was practicing while walking with my uncle along the river. The sun was setting, the trout were playful and from time to time one would shoot up into the air, its glistening body sharply defined against a projecting rock beyond. Of course any boy might have hit a fish under these propitious conditions but I undertook a much more difficult task and I foretold to my uncle, to the minutest detail, what I intended doing. I was to hurl a stone to meet the fish, press its body against the rock, and cut it in two. It was no sooner said than done. My uncle looked at me almost scared out of his wits and exclaimed *"Vade retro Satanas!"* and it was a few days before he spoke to me again. Other records, however great, will be eclipsed but I feel that I could peacefully rest on my laurels for a thousand years.

(In the April issue Mr. Tesla will describe in detail how he conceived one of his most important and far reaching inventions: "The Rotary Magnetic Field."—Editor.)

He's Winning!

Because He Followed His BENT.

Age 28—Salary $2500 a year—General Manager of the Company—his own boss—owns his home—married and happy and prosperous—there's the success of Wallace H. Rohrschneider, General Manager and Secretary and Treasurer of the Hustisford Light, Power and Manufacturing Company of Hustisford, Wisconsin.

"I followed my bent," says Mr. Rohrschneider. That's all. "I followed my bent." In these crisp words he sums up his success. Young—unknown—of humble birth—reared on the farm and deprived of scholastic advantages, he entered this school in 1907 and took up the study of Electricity. And today—at 28—in the work he felt he was fitted for—he's well on the road to success. Simply because he answered his instincts. Simply because he followed his bent.

Is Electricity YOUR "BENT"?

If it is—if you like to tinker with dry cells—if you like to experiment with "wireless"—if you're keen for the columns of "How To Make It" and each new edition of Electrical Experimenter is a fresh revelation to you—then tackle the job in earnest. Study electricity. Make a real start. And do it now right on the eve of the big coming era of reconstruction when thousands of trained electrical experts will be needed at home and abroad.

Earn While You Learn If You Wish—½ day of classes—½ day of paid employment—that is the basis of our "Earn-While-You-Learn" plan.

Hundreds of young men of ambition are taking advantage of the opportunities afforded by electricity to insure for themselves a sound, successful future. Why not decide now to join them? Why not take the first step today? Filling out and mailing this coupon will help you decide. Do it now and get the facts. No obligation whatever.

Spring Term Opens April 1st

Opportunity Ad-lets

YOU will find many remarkable opportunities and real bargains in these columns. It will pay you to read and investigate the offerings made every month by reliable firms, dealers and amateurs from all over the country. No matter what you may be seeking, whether supplies, automobile accessories, the opportunity to make money, or anything else, you will find listed here the best and most attractive specials of the month.

Advertisements in this section seven cents a word for each insertion. No advertisement for less than 50c accepted. Name and address must be included at the above rate. Cash should accompany all classified advertisements unless placed by an accredited advertising agency. Ten per cent discount for 6 issues. 20 per cent discount for 12 issues. Objectionable or misleading advertisements not accepted. Advertisements for the April issue must reach us not later than February 22.

The Circulation of the Experimenter is over 100,000 and climbing every month

EXPERIMENTER PUBLISHING CO., INC., 233 Fulton Street, New York, N. Y.

Aeronautics.

Build your own aeroplane. Outfits cut to fit ready to assemble, on terms. G. Angeles, East Seattle, Wash.

Kites, send 25c for the "High Flier", Seefang, 1405 Broadway, New York.

Automobile Accessories.

More Power, Less Fuel, No Carbon. No mystery, plain facts, results guaranteed. Write for booklet S. O. "No-Leak-O Piston Ring Co., Baltimore, Md.

Fords Start Easy in Cold Weather with our new 1919 carburetors. 34 miles per gallon. Use cheapest gasoline or half kerosene. Increased power. Styles for any motor. Very slow on high. Attach it yourself. Big profits to agents. Money back guarantee. Thirty days' trial. Air-Friction Carburetor Co., 270 Madison, Dayton, Ohio.

Vulcanize on Anderson Steam Vulcanizer. See Advertisement, Page 836.

Wonderful Tire Bargains. At one-quarter the usual tire cost, we can furnish you with Double Tread Tires, also Black Rib Tread Cord Type Tires. Guaranteed 4000 miles. Send for price list. Save 50% on tire cost. United Sales Co., Aberdeen, So. Dak.

Repair parts for all make cars, also engines. Carburetors, magnetos, bucket seats for racing cars. We also carry a large stock of slightly used tires and tubes at very lowest prices. Write for list. Hayiland Supply Co., 2306 Seventh Ave., New York City.

Automobile Repairs.

Automobile Owners should subscribe for the Automobile Dealer & Repairer; 150-page illustrated monthly devoted exclusively to the care and repair of the car. The only magazine in the world especially devoted to the practical and mechanical side of motoring. The "Trouble Department" contains five pages of numbered questions each month from car owners and repairmen which are answered by experts on gasoline engine repairs. $1 per year or 15 cents per copy. Canadian subscription $1.50. Postals not answered. Charles D. Sherman, 48 Windsor Road, Hartford, Conn.

Motorcycles.

Motorcycles from $25 up—New and second-hand. Easy terms, large list to choose from, all makes. Send 4c stamps for Bulletin "A." Peerless Motorcycle Co., Watertown, Mass.

Motorcycles: Used parts for Indians, Thors and Excelsiors at 70 to 75 per cent off catalog list price. One rear pleasure car $60. Used motorcycles for $25 up to $225. Send for list. Peter Fox, Indian Dealer, Grand Junction, Colo.

Help Wanted.

Men Wanted to make Toy Soldiers, Army, Navy, and other toys. Homeworkers on small scale, manufacturers on large scale. Greatest chance for industrious people for independent business. Enormous demand and future in "American-made toys". This new American work stands out conspicuously. Factories have been established, people trained, machinery made with energy and success. Dealers don't want to handle any others except "American-made". We buy these goods all year, paying fixed prices. Experience or tools not necessary. Hundred and more made complete per hour. Casting form outfits $3 up. Booklet and information free. Toy Soldier Manufacturing Co., 32 Union Square, New York.

To Ascertain the Vocation for which you are best adapted send for Zancig's Revised Horoscope. Send date of your birth and 25c. Prof. Zancig, 109 West 87th St., New York.

Railway Mail Clerks Wanted—men 16 to 40—women 18 to 35. $1192-$1800 year. Alternate weeks off. Full pay. Examinations everywhere. Sample questions free. Franklin Institute, Dept. C 26, Rochester, N. Y.

Agents Wanted.

Greatest, biggest and best collection of modern money-making ideas printed. 2600 ideas, opportunities and secrets. Write "Hanson," Box 23, Mentor, Minn.

$10 Daily refinishing chandeliers, brass beds, automobiles by new method, without capital or experience. Free particulars and proofs. Write today. Gunmetal Co., Ave. D, Decatur, Ill.

Insyde Tyres, inner armor for automobile tires, double mileage and prevent punctures and blow-outs. Quickly applied. Costs little. Demand tremendous. Profits unlimited. Details free. American Automobile Accessories Co., Dept. 54, Cincinnati, O.

Postcards.

Everything in Postcards. Live-wire list free. Worth-while samples 25c. Mention subjects preferred. Mutual Supply Co., Bradford, Pa.

Five Prettiest Women Cards, hand colored, 25c. Durso, Dept. 41, 25 Mulberry, N. Y. City.

Charlotte, N. C.

Electrical Experimenter Pub. Co.,
233 Fulton St., New York.

Dear Sirs:

It certainly was SOME RESULTS.
I've almost worn out a good typewriter.
Just about exhausted myself writing.
Used all the paper in this part of America.
And about "Gone Busted" buying postage stamps.

Now, I'm a-goina quit, and will never do it again, or at least I won't promise to answer all the letters I received from an Ad that I put in the "E. E."

The letters are still coming in.—The apparatus advertised has long since been sold. Every piece of it. The letters are from all over the United States, AND ELSEWHERE. Received one today from Shanghai, China. Can you beat that. I'm enclosing the letter from China.

It's a great life, if you don't weaken.

I wish to THANK the "E. E."—Some circulation.

Very Respectfully,
G. R. SMATHERS,
403 N. Brevard St., Charlotte, N. C.

For the Hair.

I was Bald. Obtained hair growth by an Indian's ointment containing genuine bear oil and rare plant juices. Many others have good hair-growing results. Will send box, postpaid, with recipe, 10c. John Hart Brittain, 150 E 32nd St., B.A. 360. New York.

News Correspondents.

Earn $25 Weekly, spare time, writing for newspapers, magazines. Experience unnecessary; details free. Press Syndicate, 566 St. Louis, Mo.

Scenery for Hire.

Collapsible Scenery for all Plays. Amelia Grain, Philadelphia, Pennsylvania.

WATCH CAMERA

The most wonderful and Ingenious Camera made

It is but little larger than a watch, which it closely resembles. You can carry the Expo about in your pocket and take pictures without any one being the wiser.

One Cent a Picture

The Expo loads in daylight with 25 Exposure Films, costing 15c, thus the picture taking part of a whole day's outing may be had for the nominal sum of 15c—One cent a picture. 10 Exposure Films for 25c, daily procurable. It is simplicity itself to operate. Takes pictures through the stem, where the Rapid Fire Lens is located. The photos (5/8 x 7/8) may be enlarged to any size.

Price $2.50

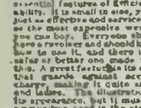
QUICK AS A FLASH Time and instantaneous shutters; the latter but 5 cents; nickel plated. Endorsed by amateurs and professionals the world over. Thoroughly practical—amazing and delighting as ordinary cameras—in daily use by the police, newspaper reporters, detectives, and the general public. Important facts have been secured with the Watch Camera by enterprising reporters. Produces clear, sharp negatives indoors or outdoors equal to any camera on the market, size or price notwithstanding.

Expo Watch Camera $2.50 Postage 10c Anywhere

FILMS, 10 Exposures 15c, 25 Exposures, 25c
Leather Pocket Carrying Case, 35c

JOHNSON SMITH & CO., Dept. E 4, 54 W. Lake St., CHICAGO

"The Baby" Double Action Revolver



Hammerless

A Handsome and Most Effective Weapon. Measures but 6¼ Inches Long. Takes Regular .32 Caliber Cartridges $5.50

The new Baby Double Action Hammerless Revolver has been produced to meet the ever increasing demand for a revolver that would combine small size and light weight with the essential features of efficiency and practicability. It is small in size, but is just as effective and serviceable as the most expensive weapon you can buy. Everyone should have a revolver and should know how to use it, and there is no safer or better one made than this. A great feature is its safety action that guards against accidental discharge, making it quite safe for young men and ladies. The illustration gives an idea of its appearance, but we need say no more to demonstrate its merits. The ammunition used is the standard .32-caliber cartridge obtainable anywhere. The operation of the cartridges is extremely rapid and absolutely reliable, as all well aimed shots can be fired in as many seconds. The revolver is very well constructed, with finest nickel plated fluted barrel of rifle cut, and is weighs only 24 ounces. The price of the Baby Revolver is only $5.50, mail or cash, p.p. In any address.

JOHNSON SMITH & CO., Dept. E 4, 54 W. Lake St, CHICAGO

Sneezing Powder

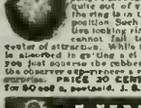
Place a very small amount of this powder on the back of your hand, and then blow it into the air, and everyone in the room or within sight will begin to sneeze without knowing the reason why. It is most amazing to hear them sneeze, as they never know the source, but think they have caught it one from the other. Serves to tickle the throat and sneezing you yourself will be having the time of your life. For parties, social get-together, or any place where there is a gathering of people, it is the greatest fun out. Price 12c or 3 for 30c.

JOHNSON SMITH & CO.

STAGE MONEY

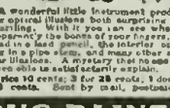
With a bunch of these bills, it is easy for each person of limited means to operate a successful game of roulette. Each of these bills at the proper time and peculiarly off a genuine bill or two from the outside of the pocketbook, the owner of which will be found to be all that can be desired. Prices, postpaid: 75 Bills 10c, 150 Bills 25c, 125 for 50c, 400 for $1.00 thousand.

GREATEST TOY SENSATION OF THE DAY!



FIGHTING DREADNAUGHT

SENSATIONALLY REALISTIC!!!



Here is a model of Uncle Sam's fighting monsters. Eight big guns, each of which flashes, at correct intervals, from twelve to twenty times. Extra ammunition always obtainable. Absolutely harmless. Can be operated indoors or out. Now, boys! Here's your chance to see a battleship in action, and the best of it is you can OWN the ship and command the firing yourself! By having two or more Battleships, you can stage EXCITING NAVAL BATTLES in your own home. Price of Warship and Ammunition, 180, three for 400, or a fleet of 52 ships for $1.80 postpaid. Extra Ammunition, 8 sorts per pkg.

SQUIRT RING

You may have a lot of fun with the Sparkling Comic Squirt Ring. It consists of a be-domino gated ring, attached to a rubber ball, as at present shown, but the latter is quite out of view when the ring is in the proper position. Such an attractive looking ring as this cannot fail to be an object of attraction. While the victim is absorbed in getting a fair view you just squeeze the rubber ball and the observer gets more a very great surprise. PRICE 20 CENTS. Three for 50 cent s, postpaid. J. S. & CO.

Wonderful X-Ray Tube

10¢

A wonderful little instrument producing optical illusions both surprising and startling. With it you can see what is apparently the bones of your fingers, the lead in a lead pencil, the interior spring in a pipe stem, and many other similar illusions. A mystery that no one has been able to satisfactorily explain.

Price 10 cents; 3 for 25 cents; 7 doses, 75 cents. Sent by mail, postpaid.

LUMINOUS PAINT

Make Your Watches, Clocks, Etc., Visible by Night The very latest discovery in the scientific world. Simple, harmless, genuine, totally unobtainable except at an exorbitant price, and have at last succeeded in producing LUMINOUS PAINT, which, applied to the surface of any article, emits rays of white light, rendering it perfectly visible in the dark. THE DARKER THE NIGHT, THE MORE BRILLIANT IT SHINES. Quite simple to use. A little applied to the dial of your watch or clock will enable you to tell the time by night. You can coat the push buttons of electric lights, match boxes, and innumerable other articles, make your own Luminous Crucifixes, Luminous Rosaries, etc. Bottle containing sufficient to coat a dial 2½ inches in diameter, sent postpaid, by mail or express, only 90c and $1 postpaid. Johnson Smith & Co., Dept. E 4, 54 W. Lake St., Chicago.

MUSICAL KAZOO

With the Musical Kazoo you can, without the least practice whatever, play any tune right off, imitating any bird or animal, trombone, snare drum, Punch and Judy, etc. No holes to finger. It is simplicity itself. Produces excellent music. You do not blow into it, but sing, hum or speak into the instrument. Used with astonishing results at society entertainments, lodge, club or church entertainments, dances, serenades, picnics, parties, etc. Humorous. Just the thing for choruses and shows. Bands and marching clubs, etc. Excellent for vocal or instrumental accompaniments, either with or without other musical instruments. Price 15c p. pe.

MAGIC FLUTE

Wonderfully Sweet Toned and Musical

A marvelous musical instrument. No other instrument produces sweeter music, whether it be the brave notes of a quick step or the soft and plaintive strains of a church hymn—in fact, any class of music can be played upon the Magic Flute without practice, as it is almost a self-playing instrument. When played with a piano accompaniment, or any other musical instrument, the effect is charming. Full printed instructions for playing sent with each instrument.

Price 15c

New Vamping Card

No Teacher Needed Surprisingly Simple System

Persons having neglected their Musical Education need not despair, for with the aid of our new VAMPING CARD placing the card upright over the piano keyboard, you can at once Vamp away to thousands of Songs, Ballads, Waltzes, Rag Time, etc., etc., equal to a Professional Musician. No knowledge of music is required. After using it a few times, you will be able to dispense with the aid of the Vamping Card entirely. Only 15 cents, postpaid. Johnson Smith & Co., Dept. E 4, 54 W. Lake St, Chicago

The CONJURER'S CASKET

Apparatus and Directions for a Number of Mysterious Tricks Enough for an Entire Evening's Entertainment

ANYONE CAN DO THEM

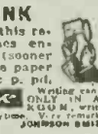
50c

It is great fun mystifying your friends. Get this Conjurer's Cabinet, and you will be the center of attraction in great shape. It contains the apparatus for seven first-rate tricks, including The Disappearing Rose, which appears on the lapel of your coat, or anywhere from sight at will; the Magic Vase and Ball Trick to Wonder Ball is placed inside, and upon replacing the lid has disappeared and is found in some other place; The Magic Pin with which you seem to apparently cut your finger almost in two, the Wonderful Card Trick (a card is placed in an envelope, and when opened an entirely different card appears to be found); The Disappearing Coin Box (a coin is placed in the little wooden barrel, and when opened again, is found to have vanished entirely, or can be made to change into a coin of another denomination); The Famous Hammered Penny that defies the law of gravitation (suspends from the top of the head, nose, cheek, veil, clothing, etc.); The Glass Goblet and Vanishing Coin Trick (a coin is dropped into a glass of water, and when the water is poured out the coin has vanished). With the seven tricks described above we send full printed instructions for performing each trick, so that anyone can readily perform all the tricks to the great amusement of their friends or the public. Any boy of ordinary intelligence, with this Cabinet of Tricks in his possession, can give a clever entertainment. Nothing complicated or machinelike. Besides the tricks contained in the Cabinet, there are twenty-five other feats and illusions fully explained with full printed instructions, for which you can readily make or procure the necessary apparatus. Among them are The Mouse in a Pack of Cards; The Unseen Card; The Hat Trick; To Knock a Tumbler Through a Table; One Coin Found Inside Two; To Find the Number Thought of; Mysterious Wedding Ring etc. We also send the secret of performing three wonderful stage tricks, as follows: The Artificial Leg; The Leg Raising a Woman; Walking on the Ceiling of a Room, and the Disappearing Lady, together with an article describing the secret of the Vanishing Lady Cabinet. PRICE COMPLETE 50c.

ANARCHIST BOMBS

Consists of a little glass vial, containing a liquid form a chemical which will cause a most horrible odor. One dropped in a room full of people will cause more consternation than a limburger cheese. The smell will control disappear in a short time. 3 Boxes for 25c, shipped by express only with a Dollar's worth of other merchandise.

ITCHING POWDER



This is another good practical joke; the intense discomfiture of your victims to everyone but themselves is thoroughly enjoyable. All that is necessary to make the ball rolling is to deposit a little of the powder on a person's hand and the powder can be relied upon to do the rest. The result is a vigorous scratch, then some more scratch, and still some more. 3 Boxes for 25c. Sent only by express. (Must order at least 50c Dollar's worth of other merchandise.)

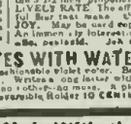
INVISIBLE INK

The most confidential message can be written with this ink for the writing MAKES NO MARK. Can be read by no one but those you know the secret. Invaluable for many reasons. Keeps your postals and other private memorandums away from prying eyes. Great fun for playing practical jokes. Only 15c per bottle.

VANISHING INK

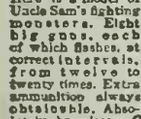
Writing written with this remarkable ink vanishes entirely in a few seconds (or less, if desired), leaving the paper QUITE BLANK. 15c p. pd.

LUMINOUS INK Writing can be READ ONLY IN A DARK ROOM. Write with pen or brush. 15c bottle. Quite invisible at daytime. Very remarkable. 15c bottle, 3 for 40c postpaid.



JOHNSON SMITH & CO.

GOOD LUCK RING

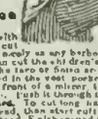


Don't fail to send for one of these VERY striking and unusual rings. It is made of gunmetal, finely finished and oxidized, and has a handsome design which is emblematic of Good Luck. Being a genuine curiosity it will attract the attention of everyone you meet. It is said by many to bring Good Luck to the wearer, hence its name Good Luck Ring, and while we will not positively guarantee that it is certainly a very unique ring that you will take a pride in wearing. They are made to sell at 50 cents, but as a special bargain we will supply them to our customers at this paper at HALF PRICE, viz., ONLY 25 CENTS, POSTPAID. JOHNSON SMITH & CO.

Newest Novelty Aerial Balloon

Flies gracefully in or outdoors. This is the VERY LATEST SENSATION IN BALLOONS. A bright colored balloon that measures six inches from tip to tip when blown up in the usual way, and, when released the air pressure sends the balloon SOARING TO AREA of 3 1-2 feet in a popular WINNING AROUND AT A LIVELY RATE. The effect is startling. It is a wonderful fine trade. The youngsters WILL GO WILD WITH JOY. May be used repeatedly indoors or outdoors. An immense ly interesting toy. Price 10c each. 3 for 25c, postpaid. Jos. K. Smith & Co., Chicago.

INKLESS PEN WRITES WITH WATER



500 words every time you dip. Makes 1 to 2 copies. Writes as easy as with Nickel Plated Reversible, Holder 10 CENTS, 3 for 25c.

Write fashionable visiting card. Better and more reliable pen. Writes a long letter with one dip in plain water. No trouble. Simple as a lead pencil. Can be carried in the vest pocket ready for instant use and will last a lifetime. To use it, stand in front of a mirror, 1 pace away, and as the UTILITY TRIMMER lits the pop would a room. Push it through the hair downward, in the direction the hair lies, but never upward. To cut long hair, first straighten the hair, so it will lay smoothly, then start cutting at the top of the head and work downward cuts as high as you desire, evenly all around the head. Finish around the neck and ears with a square cut, like a barber. It is impossible to leave any "shingle" or "rat tail" on the head when using this device. The long, thin, single guard prevents the cutter blade from ever cutting the scalp. To cut very close, push the blade until the cutting edges are even with the gua d teeth. To thin out heavy hair, push the blade through the hair, reversing the blade in the holder, the cutting edge being to the back of the holder, exposing the safety blade, except the corner. To bevel, turn the blade in the holder, which will allow only the back, making the blade cut until the cutting edge is even with the back of the holder. Then hone in the usual manner. Finish on a strop as in an ordinary razor. Johnson Smith & Co., Dept. E 4, 54 W. Lake St., Chicago

Trim Your Own Hair With the Utility Safety Hair Cutter

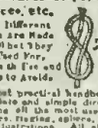
Agents Wanted

Cuts the Hair Any Length, Short or Long—Saves Its Cost First Time Used.

Price Only 35c Extra Blades 50 Each

If you can COMB your hair you can TRIM your own hair with this marvelous invention. The UTILITY TRIMMER will cut your hair any length you desire, short or long, finish the job as neatly as any barber and in less than half the time before your own mirror. The lade s can cut the children's hair at home in a jiffy; can be used as an ordinary razor to shave the face or and the temples as a neck. Sharper than any razor; can be carried in the vest pocket ready for instant use and will last a lifetime. To use it, stand in front of a mirror, 1 pace away, and as the UTILITY TRIMMER lits the pop would a room. Push it through the hair downward, in the direction the hair lies, but never upward. To cut long hair, first straighten the hair, so it will lay smoothly, then start cutting at the top of the head and work downward cuts as high as you desire, evenly all around the head. Finish around the neck and ears with a square cut, like a barber. It is impossible to leave any "shingle" or "rat tail" on the head when using this device. The long, thin, single guard prevents the cutter blade from ever cutting the scalp. To cut very close, push the blade until the cutting edges are even with the gua d teeth. To thin out heavy hair, push the blade through the hair, reversing the blade in the holder, the cutting edge being to the back of the holder, exposing the safety blade, except the corner. To bevel, turn the blade in the holder, which will allow only the back, making the blade cut until the cutting edge is even with the back of the holder. Then hone in the usual manner. Finish on a strop as in an ordinary razor. Johnson Smith & Co., Dept. E 4, 54 W. Lake St., Chicago

THE "LITTLE GIANT" TYPEWRITER



A First Class Writing Machine For $1.25

A perfect little typewriter for $1.25. There are thousands of persons who would like to use a typewriter but the fees and rentals are so net warrant the purchase at $100 to the purchaser and the operator is not perfect as confidently recommend our Little Giant. It is strongly built, yet simple in construction, so that any one can quickly learn to operate it, and write as rapidly after the first hour as with the best. Each of the alphabet most frequently used being so grouped as to enable one to write rapidly. Use a pencil to write the punctuation marks being touched. With this machine you can send your best girl typewritten love letters, address envelopes, make out bills, and do almost any kind of work that a typewriter will do. Size 10x6 inches. With each typewriter we send a bide of ink and full printed instructions for using for using the machine. Price complete $1.25 by mail postpaid.

NEW BOOK ON ROPE SPLICING

Useful Knots, Hitches, Splices, etc.

How Different Knots Are Made and What They are Used For; Knots to Tie and Knots to Avoid.

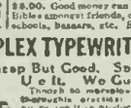
A most practical handbook giving full and complete and simple direction for making all the useful knots, hitches, splices, etc. Over 300 illustrations. Also how to splice rope, fasten hammocks, lashing, hitches, bowlines, etc. Every boy and girl should have one. It is fully illustrated. Of great value to mechanics, riggers, campers, boatmen, etc. Price 25c postpaid.

JOHNSON SMITH & CO.
Dept. E 4, 54 W. Lake St., Chicago

SERPENT'S EGGS

Each box contains 12 Eggs, which are no larger than a grain of oats. When lit with a match, however, each one gradually hatches itself into a Snake several feet long, which curls and twists about in a most lifelike manner. Price per box 10c, postpaid. Johnson Smith & Co.

MYSTIC SKELETON

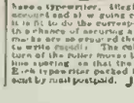


A jointed figure of a skeleton 14 inches in height, will dance to music and perform various gymnastic and acrobatic feats, the operator may be any distance from it. The figure may be examined by the spectators. When placed back to back operates it is simply placed on a chair or table, when it will perform in accordance with the music. At the command of the operator it will bow down, stand up, dance, etc. We send full directions with each skeleton, by the aid of which anyone can readily make it perform. 10c postpaid.

CIGARETTE ROLLER

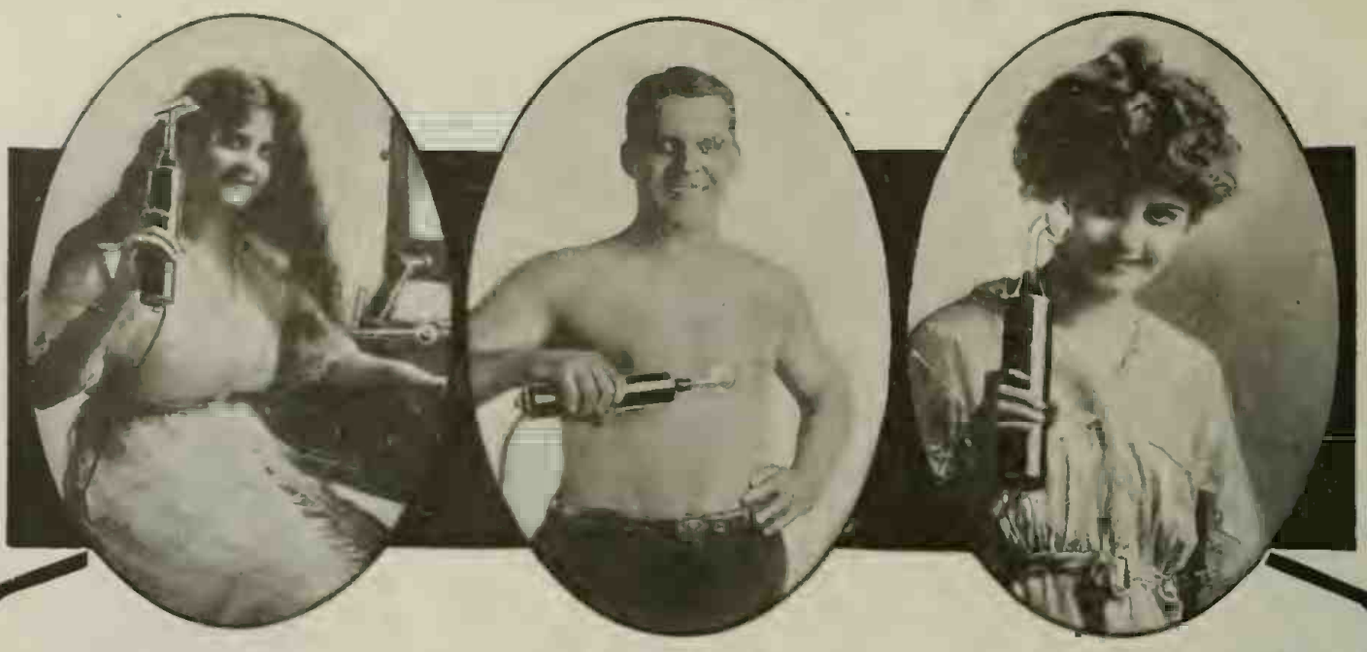
Very neat and handy. Weighs less than a quarter of an ounce. It makes better cigarettes than you can buy and makes them easily and quickly. You can use just the tobacco you prefer and thus have either "mild" or "strong" smokes, and more of them besides saving about half of your money. Just try one and make your cigarettes just to your own liking. Price only 10c or 3 for 25c postpaid, with full instructions for use. JOHNSON SMITH & CO.

MIDGET ILLUSTRATED BIBLE



A Great Curiosity

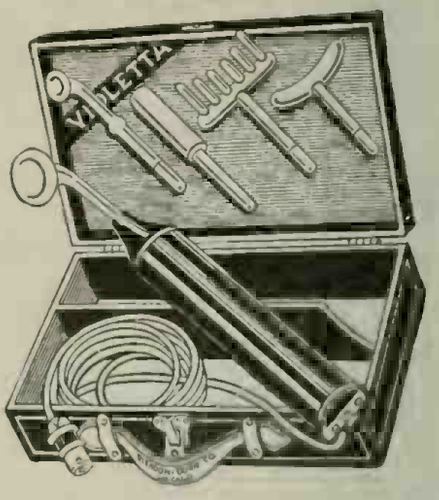
The Smallest Bible in the World



The Midget Bible is a perfect gem, and a wonder to all. It is about the size of a postage stamp and contains FIFTY-FIVE DRED AND FIFTY PAGES of the NEW TESTAMENT, perfectly illustrated. This little Bible is a wonder. It is said to bring good luck to the owner. Must be seen to be appreciated. Price, only 12 cents, these Bibles for 30 cents; one dozen Bibles for $1.00; or 100 for $8.00. Good money can be made selling these Midget Bibles among your friends, church acquaintances, Sunday schools, Bazaars, etc. Send for a few and try it.

SIMPLEX TYPEWRITER ONLY $2.50

Cheap But Good. So Simple a Child Can Use It. We Guarantee the Writing.



Though so marvelously cheap, the machine is a thoroughly practical typewriter. We guarantee it to be up to date in every respect and to do as perfect work as any $100 machine. It does not cost a cent more than the price, but we send you a specimen of the work and you will be convinced. With a reasonable care it will last a lifetime. It is so simple that a child just able to read can write with it. You can learn to write a page about in five minutes, and an hour's practice will make you an expert operator. Every business man has a typewriter, regardless of the amount of work he has to do. Makes your correspondence a pleasure instead of a task. Writes as fast as the average

Try This Wonderful New

VIOLET-RAY

Machine—10 Days Free!

NOW in your own home you can have wonderful Violet-Ray treatments exactly as are given by eminent physicians and beauty specialists throughout the country. Now you can rid yourself of headaches, catarrh, constipation, eczema, insomnia, lumbago, nervousness. Relieve your pain from neuritis, rheumatism, and other disturbances. Multiply your bodily health, vitalize your nerves, double or treble your energy by using Violet-Rays. Sleep better, increase your strength, and improve your appetite and digestion. Soothe your nerves, reduce or increase your flesh. Tone and strengthen the entire system. Beautify your complexion! All with Violet Rays!

Not a Vibrator

The wonderful Violetta is not a Vibrator. It is not a machine that contracts the muscles—it does not shock, it does not pound the muscles—it is absolutely painless. Violet-Rays administered by the Violetta are wonderful even for infants! Relieve pain and suffering in every part of the body. Simple tests prove that Violet-Rays pass completely through every part of the body, stimulating every cell and organ. It is electricity in its highest remedial form.

Treat Yourself at Home

Here is a partial list of ailments treated successfully, with the Violetta, Violet-Ray Machine.

Asthma	Earache	Obesity
Barbers' Itch	Eczema	Pains
Boils	Eye Disease	Paralysis
Blackheads	Falling Hair	Piles
Bunions	Hay Fever	Pimples
Callous	Headache	Pyorrhea
Catarrh	Goitre	Rheumatism
Chilblains	Insomnia	Skin Diseases
Colds	Lumbago	Sore Throat
Corns	Nervousness	Sprains
Constipation	Neuralgia	Tonsilitis
Dandruff	Neuritis	Whooping Cough
Deafness		

What Physicians and Users Say

Trixie Friganza, well known actress, says: "Cheerfully will I add my praise for Violetta. It's the best 'pain chaser' and 'soother' I've had the good fortune to find. It's WONDERFUL. It cured my brother of neuritis. As for myself I use it for facial treatments and general massage. I cannot say too much for it."

Dr. Bert H. Rice, of Vinton, Iowa, says: "I have good results with the Violetta High Frequency Instrument in all cases of neuralgia. Almost instant relief in Facial Neuralgia."

K. L. Allen, D. C., 205 Boone National Building, Boone, Iowa, says: "I have had very good results with the application of High Frequency Current in cases of Paralysis, Rheumatism and Neuritis, and think it a great help in drugless healing."

Dr. Daniels, Lisbon, North Dakota, says: "Have used the VIOLETTA in such cases as Goitre, Bronchitis, Pleurisy, Neuritis, Neuralgia, and Lumbago, and find it very beneficial. In fact, I would not be without it in my office."

Frank Borzone, Seattle, Wash., says: "I purchased the VIOLETTA for my wife who was suffering from an acute attack of Sciatica. From the very first treatment it induced peaceful rest and she is entirely well now."

Every Electrical Man Wants These Books and we ship them for your inspection FREE

Flexible Covers — Handy Pocket-Size Volumes

10 Volumes — 3500 Pages — 4700 Pictures

$1 Per Volume

$1 Per Month

Just what you need to know to succeed in ELECTRICITY

EVERY electrician, every engineer, every mechanic should know about these wonderfully helpful instructive books, which give in plain words a complete working knowledge of electrical engineering in all its phases.

You run into some new electrical problem almost every day. The information you need to help you in your every day work is in

HAWKINS ELECTRICAL GUIDES

These books place electricity at your finger ends. They cover every imaginable subject, principle, theory, problem, trouble, and way of doing things electrically. Every subject is indexed so that you can turn right to it. They are a study course and a reference guide in one, written in plain every day language—no wasted words—only what you need to know—chock full of up-to-the-minute electrical knowledge. The guides are a complete course in electrical engineering. They will help you in every detail of the day's electrical work. You can't ask an electrical question that Hawkins Guides can't answer.

What Electrical Men Say

Helped Him Make Good

"It is only right for me to recommend highly the Hawkins Guides, for they have been of the greatest assistance to me in placing me in my present position as Superintendent of Construction Department of one of Ohio's largest Electrical Companies. I would like to see every man have a set of Hawkins Guides."
Geo. Knecht, Columbus, Ohio.

In the Naval Electrical Dept.

"The Hawkins Guides are great help to me in the Naval Electrical Department, which they cover very thoroughly."
C. J. Cornell,
U. S. Receiving Ship, Brooklyn, N. Y.

Superintendent

"I am now superintendent of the Dunnville Hydro-Electric Systems, and Hawkins Guides were a great help to me in holding down a responsible position."
W. E. Swartz, Dunnville, Ontario.

Wireless Operators

"I have worked wireless for ten years—but I wish I had these books years ago, as they have saved me a great deal of trouble." H. Marshall,
Steamer M & B No. 2,
Walkerville, Ont.

Pocket-Size Flexible Covers

The books are small enough to slip into your coat pocket—handsomely bound in flexible black covers.

You can carry each volume with you until you have mastered its contents. 3,500 pages of actual information and 4,700 illustrations. Once you see these books and put them into actual use you will never again want to be without them. Try it at our expense.

SEND NO MONEY

It will cost you nothing to receive these books—to look them over—ask them all the questions you can think of—use them in your work—study them—pick up some information that will increase your earning ability. We will ship you the entire set of 10 volumes entirely FREE.

This is a sign of our confidence in the guides. Pure gold does not object to being tested. Keep them for seven days and if you do not decide that you can't get along without them, return them to us and owe us nothing.

When you decide to keep them you only have to pay $1.00 down and remit the balance of $9.00 on the easy payment of $1.00 a month till paid for.

Use this coupon to get the books. It will pay you many times over.

READ THIS PARTIAL LIST OF CONTENTS

No. 1 Contains 348 pages, 388 illustrations. Electrical signs and symbols—static and current electricity—primary cells—conductors and insulators—resistance and condu. ity—magnetism—induction coils—dynamo principles—classes of dynamos—armatures—windings—commutation—brushes, etc.

No. 2 Contains 348 pages, 394 illustrations. Motor principles—armature reaction—motor starting—calculations—brake horsepower—selection and installation of dynamo and motors—galvanometers—standard cells—current measurement—resistance measurement—voltmeters—wattmeters—watt hour meters—operation of dynamos—operation of motors, etc.

No. 3 Contains 300 pages, 423 illustrations. Distribution systems—wires and wire calculations—inside, outside and underground wiring—sign flashers—lightning protection—rectifiers—storage battery systems, etc.

No. 4 Contains 270 pages, 379 illustrations. Alternating current principles—alternating current diagrams—the power factor—alternator principles—alternator construction—windings, etc.

No. 5 Contains 320 pages, 614 illustrations. A. C. Motors—synchronous and induction motor principles—A. C. commutator motors—induction motors, transformers: losses, construction, connections, tests—converters—rectifiers, etc.

No. 6 Contains 298 pages, 472 illustrations. Alternating current systems—switching devices—circuit breakers—relays—lightning protector apparatus—regulating devices—synchronous condensers—indicating devices—meters—power factor indicators—wave form measurement—switch boards, etc.

No. 7 Contains 316 pages, 379 illustrations. Alternating current, wiring power stations—turbines: management, selection, location, erection, testing, running, care and repair—telephones, etc.

No. 8 Contains 332 pages, 436 illustrations. Telegraph—simultaneous telegraphy and telephony—wireless—electric bells—electric lighting—photometry, etc.

No. 9 Contains 332 pages, 427 illustrations. Electric railways—electric locomotives—car lighting—trolley car operation—miscellaneous applications—motion pictures—gas engine ignition—automobile self-starters and lighting systems, electric vehicles, etc.

No. 10 Contains 513 pages, 599 illustrations. Elevators—cranes—pumps—air compressors—electric heating—electric welding—soldering and brazing—industrial electrolysis—electro plating—electro-therapeutic—X-rays, etc.

Also a complete 126-page ready reference index of the complete library. This index has been planned to render easily accessible all the vast information contained in the 10 electrical guides. There are over 13,500 cross references. You find what you want to know instantly.

BE A CERTIFICATED ELECTRICIAN

I WILL TRAIN YOU AT HOME

A REAL POSITION LIKE THIS—FOR YOU

The country needs thousands of trained, Certificated Electricians to fill good positions—and at big pay. It's all a matter of knowing how, and I will teach you by up-to-date, modern instruction. You can learn at home, without interfering with your regular work, by my highly successful method of *Home Instruction* in *Practical Electricity*.

Prepare NOW and be ready in a few months to earn your $46 to $100 A WEEK

Send for this Book

My book, "HOW TO BECOME AN EXPERT ELECTRICIAN," has started thousands of young men on the way to splendid success. A new edition of this has just been printed. I want every young man interested in Electricity to have a copy, and will send you one, ABSOLUTELY FREE AND PREPAID. Write me today.

How I Train My Students

As Chief Engineer of the Chicago Engineering Works I know exactly the kind of training a man needs to enable him to get and hold good positions, and to earn big pay. I have trained hundreds of men who are holding splendid electrical jobs.

I give each of my students personal attention and a complete and thorough training. I give him a SPLENDID ELECTRICAL OUTFIT FREE, and much of the training is done by actual work. When my students graduate and receive their Certificate, they are ready for a real position. But *still more*, at any time you wish you can come to our splendidly equipped Electrical Shops for special training. No other school can give you this.

A Real Opportunity for YOU

Wishing is never going to make your dreams come true. You've got to *study*—to *learn*. A man is worth possibly $2 or $3 a day from his neck down—and no more; but there is *no limit* to what he can be worth from his neck up.

A *trained mind* is what gets the big pay. It is this training that you need, and I can train you in a few months. Are you ambitious to make a real success—then send me the coupon—today.

Electrical Outfit FREE

To every student who answers this ad I am giving a Splendid Electrical Outfit of standard size Electrical Tools, Instruments, Materials, etc., *absolutely free*. Furthermore, to every Electrical Student I give a truly *valuable* surprise that I cannot explain here.

Free Employment Service

I am continually receiving requests from employers to send them trained Electrical men. I assist my students to secure good positions. I keep in touch with them for years, helping and advising them in every possible way.

Write Now—Don't Delay

Delay never got you anything. Action is what counts. Get started—and get started now. Write me, or send me the coupon, right NOW.

The Burgess BLUE BOOK

for all Practical Men and Electrical Students

(See review of this book by Editor in December issue of your Electrical Experimenter page 568)

LIBRARY
SEP 2 8 1999
UNIVERSITY OF TORONTO

I have prepared a pocket-size note book especially for the practical man and those who are taking up the study of electricity. It contains drawings and diagrams of electrical machinery and connections, over two hundred formulas for calculations, and problems worked out showing how the formulas are used. This data is taken from my personal note book, which was made while on different kinds of work, and I am sure it will be found of value to anyone engaged in the electrical business.

The drawings of connections for electrical apparatus include Motor Starters and Starting Boxes, Overload and Underload Release Boxes, Reversible Types, Elevator Controllers, Tank Controllers, Starters for Printing Press Motors, Automatic Controllers, Variable Field Type, Controllers for Mine Locomotives, Street Car Controllers, Connections for Reversing Switches, Motor and Dynamo Rules and Rules for Speed Regulation. Also, Connections for Induction Motors and Starters, Delta and Star Connections and Connections for Auto Transformers, and Transformers for Lighting and Power Purposes. The drawings also show all kinds of lighting circuits, including special controls where Three and Four Way Switches are used.

The work on Calculations consists of Simple Electrical Mathematics, Electrical Units, Electrical Connections, Calculating Unknown Resistance, Calculation of Current in Branches of Parallel Circuits, How to Figure Weight of Wire, Wire Gauge Rules, Ohm's Law, Watt's Law, Information regarding Wire used for Electrical Purposes, Wire Calculations, Wiring Calculations, Illumination Calculations, Shunt Instruments and How to Calculate Resistance of Shunts, Power Calculations, Efficiency Calculations, Measuring Unknown Resistances, Dynamo and Dynamo Troubles, Motors and Motor Troubles, and Calculating Size of Pulleys.

Also Alternating Current Calculations in finding Impedance, Reactance, Inductance, Frequency, Alternations, Speed of Alternators and Motors, Number of Poles in Alternators or Motors, Conductance, Susceptance, Admittance, Angle of Lag and Power Factor, and formulas for use with Line Transformers.

WHAT PRACTICAL MEN SAY ABOUT THE "BURGESS BLUE BOOK"

Received your "Blue Book" and must say it is the best book I ever saw. I showed it to a friend of mine and he refused to give it back to me but he paid me a dollar and told me to get another. Rather than be without this book I am sending Money Order for three of them so I can show them to two more of my friends and have one left for myself. Wishing you would mail them at once, I am Yours very truly,

JOSEPH BRAITH, Electrician.
Madison, Wisconsin.

Your "Blue Book" received and it is just the book I have been looking for. Please mail me three more by return mail for which I am enclosing Money Order. Respectfully.

V. E. JOHNSON, Western Union Tel. Co.,
Marion, Ohio.

Have received the copy of the "Burgess Blue Book" and am very well pleased with the easily found formulas and data contained in it. I am enclosing Money Order for four additional copies. Very truly yours.

THURE C. ANDERSON.
Ridgeway, Penn.

I am enclosing three dollars for which please send me three copies of the "Burgess Blue Book". I showed the copy I got last week to some friends and three of them asked me to get them one. Very truly yours.

CHAS. H. DAVIS.
Los Angeles, Cal.

I received your "Blue Book" and after I looked over it I see that it is a very useful book. After I showed it to some fellows they wanted a copy also and I am enclosing Money Order for which please send me three at once. Yours very truly,

R. S. SWANSON.
St. Paul, Minn.

I received the three books I sent for and the next day I sold them. The fellows think they are well worth the price. Please send me three more for which I am enclosing Money Order. Yours very truly,

R. S. SWANSON.
St. Paul, Minn.

AN OPPORTUNITY FOR YOU TO MAKE SOME MONEY

To help get the "Burgess Blue Book" to the men who need it the most, we have established a resale discount to which those who have purchased a book from us are entitled. The "Burgess Blue Book" is not sold through the regular book dealers so we offer the regular book dealers' discount to men who will take orders and send them in to us. In this way the "Blue Book" is only sold by those who know its value and we feel that this arrangement is much more satisfactory to the purchaser, than if he bought it through the regular book-selling channels. The book practically sells on sight, as a man engaged in practical work realizes when he sees it, that it contains information which is extremely useful and which is difficult to obtain in any other way.

The Burgess BLUE BOOK Will Be Shipped, Postpaid, on Receipt of *$1.00*

Send dollar bill, money order or check. *I guarantee satisfaction or will return your money* if you decide not to keep the book after using it for five days

BURGESS ENGINEERING CO., YORKE BURGESS, *Consulting Engineer*

EDITORIAL

Interplanetary Messages

A FEW weeks ago Marconi startled the world by stating that he had often received strong wireless signals which seemed to come from beyond the earth. In a recent interview publisht in the *New York Evening Post* Nikola Tesla, too, reminds us that he had made known to the world years ago the fact that extra-planetary signals were recorded in his Colorado Laboratory. That was in 1899, before the world dreamt of wireless.

Even today announcements such as the above are made light of by editorial writers and others of limited scientific perception. For the earth-bound layman still persists that intelligence can only exist on Earth. Such childish reasoning shows what sort of "intelligence" blossoms on this planet. It never occurs to these reviewers to question why Nature in her Wisdom should have singled out the little speck called Earth, on which to plant beings endowed with reason. Why should there be such an exception? Life in some form or other is certain of being found on myriads of worlds thruout the Universe. And if one world dies, all life does not die with it. Svante Arrhenius shows us how life-bearing spores are carried by the pressure of light thru interstellar space, notwithstanding the absolute zero which prevails there.

In our planetary system, conditions for life, such as we know it, probably only exists on two planets: Mars and Venus. Life on the latter being more or less doubtful, due to its heavy water-laden atmosphere, there remains Mars, a body much older in evolution than the earth. Conditions on Mars we know by direct observation as well as deduction are favorable for life, and we may be certain that it exists there. And if we once grant this, we must also grant that it must have existed for hundreds of thousands of years prior to that on Earth; consequently Martian civilization must be thousands of years ahead of ours.

From this we must deduce again that the Martians probably signaled to us ages ago, when prehistoric man still roamed the forests. But why go so far back? Suppose the Martians had sent us radio messages only thirty years ago. We could never have received them, for we then had no means of recording them. Detectors and audions were undreamt of.

In all this warped logic, we presuppose wireless signals. But why should a civilization so far ahead of ours use—to them—obsolete radio waves, which, like as not, can never hope to bridge 35 million miles! If the Martians are signaling to us, you may be certain that they use an entirely different means than Radio. To be sure, it may turn out to be one of the many wave forms of the ether, but we can only make a poor guess at it today. Meanwhile Martian signals probably fly about our heads day and night, as they may have for thousands of years, but we are still deaf and blind to them. The Martian Wave Detector still remains uninvented. At that the Martians probably have used many methods on us. It is not even impossible that they may have used reflected sun rays. Bell and Tainter in 1880 demonstrated a "wireless" telephone—the Photophone—by making use of a vibrating light ray falling upon a selenium cell. Speech was transmitted over many miles this way. With necessary refinements such a system might bridge interplanetarian space.

As to one planet understanding the other, that is of course child's play. Still, many humorous editorial writers have misgivings on that score. They are afraid that on Mars 2 + 2 might equal, perhaps, 5 or 3, so how could we get together, they ask.

A simple example might serve as an illustration. Suppose an American and a Frenchman, neither knowing the other's language, were connected by a long telegraph line. Both are ignorant of the code. But both have enough sense to tap the key. Suppose both have the desire to enter into communication, what will they do? Tap out dots from one to ten, of course. Thus . . . . . etc. It will not take them many months, if they keep at it, to work out a sort of "international" language by means of dots. And the higher their intelligence, the quicker will they understand each other.

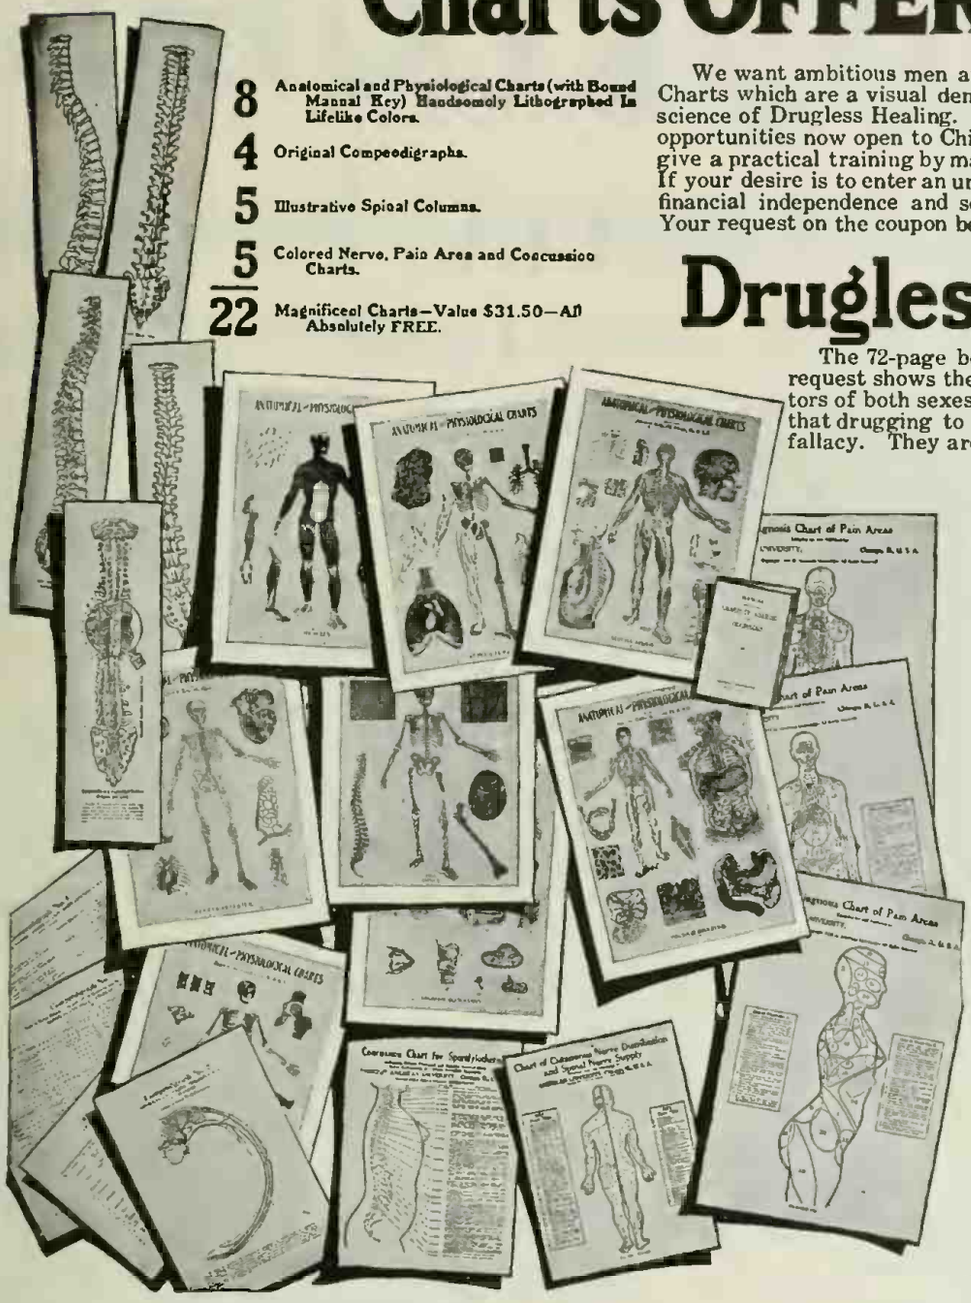
That is the basis of interplanetarian communication.

H. GERNSBACK.

The ELECTRICAL EXPERIMENTER is publisht on the 15th of each month at 233 Fulton Street, New York. There are 12 numbers per year. Subscription price is $2.00 a year in U. S. and possessions. Canada and foreign countries, $2.50 a year. U. S. coin as well as U. S. stamps accepted (no foreign coins or stamps). Single copies, 20 cents each. A sample copy will be sent gratis on request. Checks and money orders should be drawn to order of EXPERIMENTER PUBLISHING CO., INC. If you change your address notify us promptly, in order that copies are not miscarried or lost. A green wrapper indicates expiration. No copies sent after expiration.

All communications and contributions to this journal should be addrest to: Editor, ELECTRICAL EXPERIMENTER, 233 Fulton Street, New York. Unaccepted contributions cannot be returned unless full postage has been included. ALL accepted contributions are paid for on publication. A special rate is paid for novel experiments; good photographs accompanying them are highly desirable.

ELECTRICAL EXPERIMENTER. Monthly. Entered as second-class matter at the New York Post Office under Act of Congress of March 3, 1879. Title registered U. S. Patent Office.



Copyright, 1919, by E. P. Co., Inc., New York. The Contents of this magazine are copyrighted and must not be reproduced without giving full credit to the publication.

The ELECTRICAL EXPERIMENTER is for sale at all newsstands in the United States and Canada; also at Brentano's, 37 Avenue de l'Opera, Paris.

Remarkable FREE Charts OFFER

8 Anatomical and Physiological Charts (with Bound Manual Key) Handsomely Lithographed In Lifelike Colors.

4 Original Compeodigraphs.

5 Illustrative Spinal Columns.

5 Colored Nerve, Pain Area and Concussion Charts.

22 Magnificent Charts—Value $31.50—All Absolutely FREE.

We want ambitious men and women to have these remarkable Charts which are a visual demonstration of Chiropractic, the new science of Drugless Healing. This offer is now made to show the opportunities now open to Chiropractors. We also explain how we give a practical training by mail in this dignified, paying profession. If your desire is to enter an uncrowded field—if you want to achieve financial independence and social standing, at least investigate. Your request on the coupon below is all that is necessary.

Drugless Healing

The 72-page book and other literature we send on request shows the immense possibilities for Chiropractors of both sexes. The public is awakening to the fact that drugging to cure disease is in many instances, a fallacy. They are ready to welcome the practitioner who relieves and heals without nauseous dosing. The Charts show how the science of Chiropractic is applied. They reveal facts about the human body, instructive to the layman. You should obtain them without fail.

$3000 to $5000 a Year

Many Doctors of Chiropractic earn $5,000 a year and more; some upwards of $10,000. Dr. M. D. Moore of Ky., reports an income of $9,000 a year. Dr. L. H. Roche, New Jersey, $5.500; Dr. Hanna of Florida, over $5,000 yearly. What others are doing you should be able to do. A diploma gives you the same opportunity—is evidence that you are master of a profession of dignity, prestige and influence.

Our Lessons Teach You

how to make Spinal Adjustments for speedy relief of

Headache	Neuralgia
Indigestion	Neuritis
Lumbago	Catarrh
Epilepsy	Fevers
Pleurisy	Jaundice
Constipation	Dyspepsia
Rheumatism	Paralysis
Asthma	Etc., Etc.

Be a Chiropractor Learn At Home

By the American University system of instruction, you can become a Doctor of Chiropractic by studying in spare time at home or in class at the University. You do not require special talent or advanced education. A common school education and the ambition to succeed are all that is necessary. You will be trained under the direction of Chiropractic specialists who will teach you thoroughly the principles and practice of the profession. You will graduate with the degree of Doctor of Chiropractic.

Mail the Coupon

This coupon will bring full information about this new, interesting and profitable calling which any intelligent man or woman can readily master by our method—also information on how you can get these 22 instructive Charts. Send coupon for this free offer.

PRACTICAL

As experts Know it

SENT FREE FOR INSPECTION

Learn electricity as you would in actual PRACTICE—in accordance with the methods employed by the highest paid electrical experts in America. The New McGraw-Hill Library of Practical Electricity contains the actual working facts which you need in order to succeed in the electrical field. Terrell Croft, formerly with the Westinghouse Company, makes the conquest easy for you.

A New Standard in Electrical Literature

The New Library of Practical Electricity by Terrell Croft marks a new era in electrical literature.

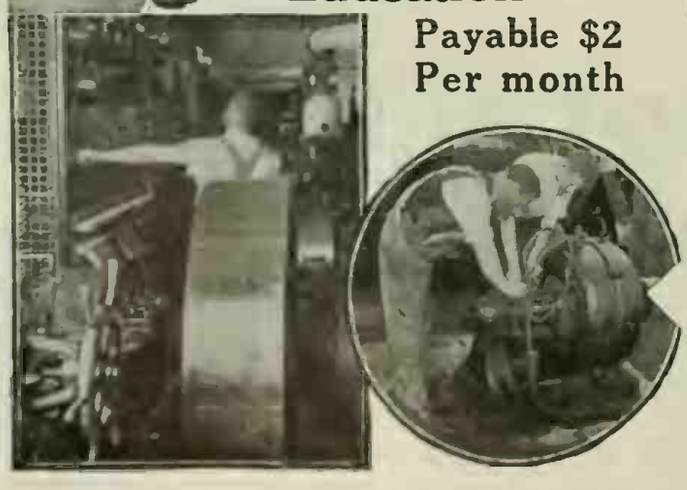
The great field of electrical engineering, with its limitless possibilities of earning power, is brought to you in a form that makes success easy. The Library is a creation—an achievement that is without parallel in technical literature, because it sticks to actual practice throughout its 3,000 pages.

ONLY

$16

for a complete Electrical Education—

Payable $2 Per month



8 Volumes
Flexibly bound
Pocket size
3000 pages
2100 illustrations
Everything you must know about electricity at the finger's end

A letter that means something to YOU—

McGRAW-HILL BOOK COMPANY, Inc.
239 West 39th Street, New York, N.Y.

Gentlemen: In an attempt to express myself about CROFT'S NEW LIBRARY OF PRACTICAL ELECTRICITY, I have never seen, and do not believe there was ever printed in the English language, a more comprehensive set of books. It is a library that is just as valuable to the novice as to the expert, because it is all practice.

Respectfully,
GUY H. PEIFER,
Chief, Doplan Silk Corporation,
Hazelton, Pa.

Learn electricity as you would in actual practice—get Croft's Library NOW

ELECTRICITY

Records of actual Work

NOT ONE PENNY IN ADVANCE

You have always wanted a compact set of books containing the solution to all your electrical problems. You have wondered if it were possible for any author to place himself in your shoes, and explain the very problems that face you every day. You have picked up books that covered the other fellow's problems, but not yours. These books seemed to touch on everything except the matters that pertained to your own work.

These books were not complete. They were probably out of date. They were probably not practical.

You have said yourself and heard others say, "I want books that fit into my work. The man who writes those books must understand my work, and know what he is talking about. I like to go into theory and the higher spheres of electricity occasionally, but not while I am on the job. Then I want plain facts, plainly stated. I want books that have anticipated my problems and figured them out for me."

Your wants have been anticipated and met in the new Croft Library. It is a seven-year undertaking recently completed by a man whose experience covers the whole field of electrical practice.

Examination will show why Croft's Library is now the accepted standard. Why it is used by the highest authority as well as the lowest beginner. Examination will show how it is revolutionizing the methods of teaching the practical side of electricity.

Examination is absolutely free. Merely return the coupon below.

READ THIS—

McGraw-Hill Book Company, Inc.,
239 West 39th St., New York.

Gentlemen:

I am enclosing money order for $2.00, which I believe is my last payment on Library of Practical Electricity. I wish to say just a word about the books. I want to go on record with the statement that they are absolutely the best set of books ever published for the man on the job. To have these books and get familiar with them makes one want to meet and talk with Mr. Croft. As a rule books which claim to be self educational are very incomplete and well padded with tables, etc., which one may find at any time in catalogues, but I will say Mr. Croft has certainly gotten away from this. A man who cannot read these books understandingly is hopeless. There never was a correspondence course even with the aid of personal letters, that could give a man real knowledge as these books do. I am Chief Electrician at a State Institution here and have use for these books every day. I fear no job because I know that if I cannot solve the problem, I've a friend at home in Mr. Croft's books, who will come to my aid.

Yours truly,

E. E. CONYER,
Anna, Ill.

Meet Terrell Croft

Be guided in your study of electricity by an experienced Electrical Engineer of high professional standing. Terrell Croft, author of 7 of these volumes, climbed from the ranks to Electrical Engineer with the Westinghouse Company. He gained his knowledge with his sleeves rolled up and has met your problems in advance. He tells in plain, understandable language how to proceed by the best and most practical methods.

Now is the time to master Electricity—Now is the time to prepare for a high salary

Old books won't do. Amateurish books won't do. Books compiled by "desk authors" or men with no practical experience will not serve your purpose.

Practical books are easiest mastered. Practical books, written by practical men, teach you accurately and rapidly. There is nothing in the Croft Library which you cannot understand. Terrell Croft tells you the secrets of success in electricity in plain words, figures and illustrations. Nothing is left to the imagination. There is no guesswork. There is no theory or higher mathematics.

Send now for these eight volumes. No matter how many books on electricity you possess, you are unfair to yourself unless you take advantage of this free examination privilege. No matter whether you are beginner or expert, these books will show you the clear road to success. Inspection will prove this.

Not one cent in advance—Just the coupon

Examine this new Library for ten full days without expense. Find out for yourself why it is now taking the lead in electrical book sales in America. Use the books as you see fit for ten days. Look at the hundreds of illustrations that clear up all the mysteries in electrical practice. Stick a couple of the volumes in your pockets, and refer to them during the day. Figure out in an instant the problems that have heretofore taken hours.

Then send us $2 per month for eight months, or return the set entirely at our expense. You risk nothing by returning the attached coupon.

EXAMINATION COUPON

McGraw-Hill Book Co., Inc.
239 W. 39th St.,
NEW YORK

Gentlemen:
Please send me the Library of Practical Electricity (shipping charges prepaid) for 10 days' free examination. If satisfactory, I will send $2 in ten days and $2 per month until $16 has been paid. If not wanted I will write you for return shipping instructions.

Master Electricity By Actual Practice

The only way you can become an expert is by doing the very work under competent instructors, which you will be called upon to do later on. In other words, *learn by doing.* That is the method of the New York Electrical School.

Five minutes of actual practice properly directed is worth more to a man than years and years of book study. Indeed, Actual Practice is the only training of value, and graduates of New York Electrical School have proved themselves to be the only men that are fully qualified to satisfy EVERY demand of the Electrical Profession.

The Oldest and Only Institution of the Kind in America

At this "Learn by Doing" School a man acquires the art of Electrical Drafting; the best business method and experience in Electrical Contracting, together with the skill to install, operate and maintain all systems for producing, transmitting and using electricity. A school for Old and Young. Individual instruction.

Over 5,000 Graduates are Successful Men in the Electrical World

No previous knowledge of electricity, mechanics or mathematics is necessary to take this electrical course. You can begin the course now and by steady application prepare yourself in a short time. You will be taught by practical electrical experts with actual apparatus, under actual conditions.

Let us explain this course to you in person. If you can't call, send now for 64-page book—it's FREE to you

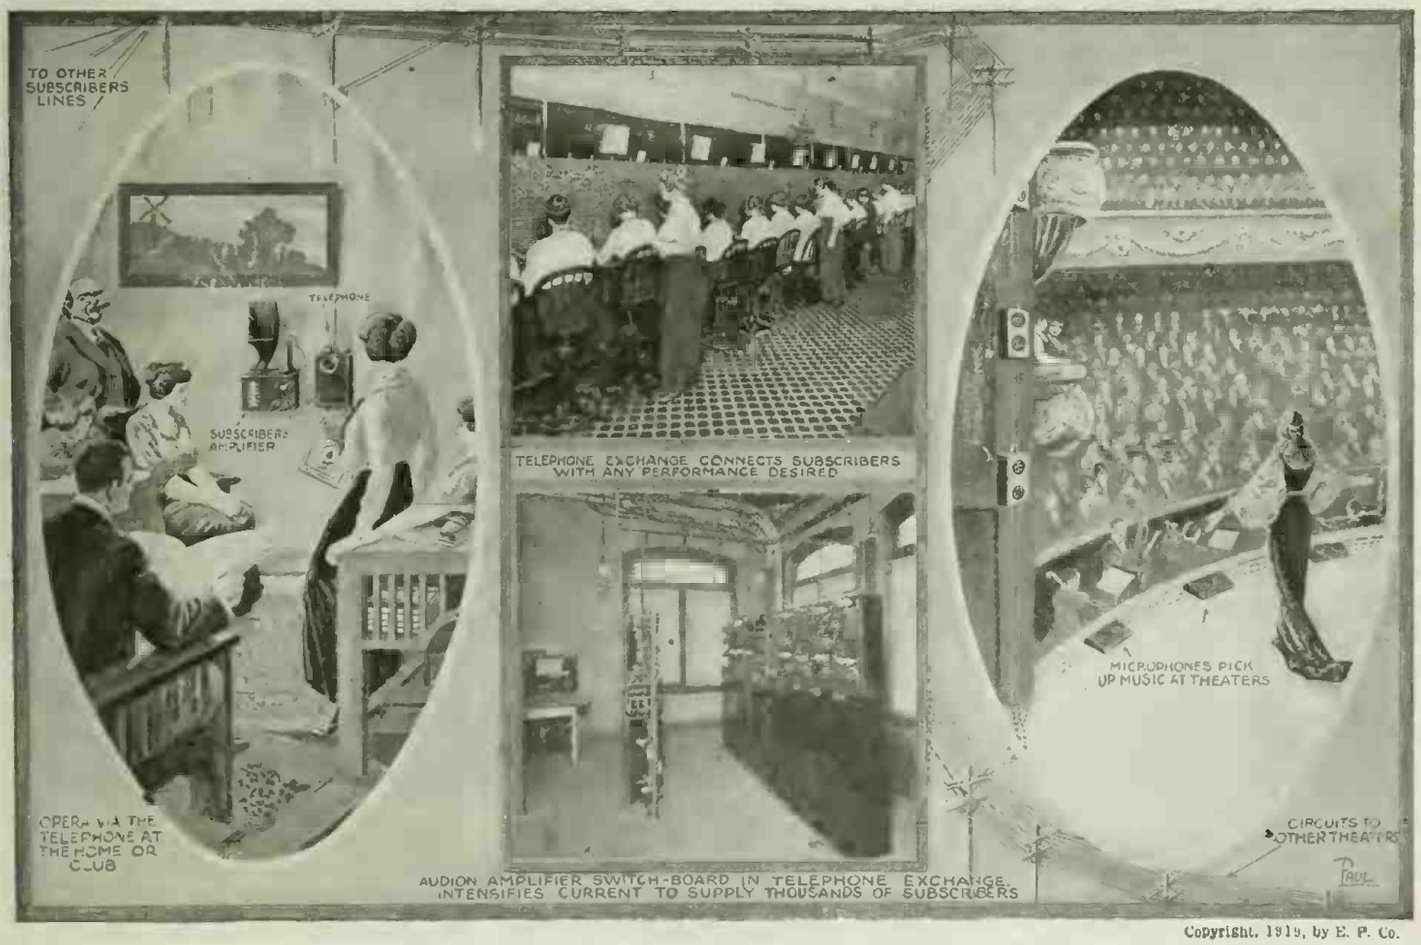
Electrical Experimenter

H. GERNSBACK, EDITOR
H. W. SECOR, ASSOCIATE EDITOR

Vol. VI. Whole No. 72 APRIL, 1919 Number 12

Grand Opera in Your Home

By H. GERNSBACK



MANY thousands of people musically inclined are deprived of hearing our great operatic stars mainly on account of the high price of admission, also because of the limited seating capacity of even our largest opera houses. Take for instance a "star" performance at the Metropolitan Opera House, New York City. It is necessary to secure tickets weeks ahead if one wishes a good seat in the house, otherwise it is often impossible to make a reservation at all.

While seats may be bought at low prices "up in heaven", only our Italian friends of limited income prefer such seats and, therefore, the gallery is usually made up entirely of really music-loving Italians.

Suppose that all you had to do was to step to the telephone at 8.30 in the evening, no matter if you lived in New York or anywhere else in the country, and immediately had the whole room filled with Caruso's voice. Would this not appeal to you, providing of course that you were musically inclined? All this is now possible, and, we believe, will shortly come about. While of course the idea itself is nothing new—it having been tried thirty years ago to transmit music in this manner,—there was one great technical difficulty at that time which only during the past two years has been overcome.

While it is a comparatively simple thing to place sensitive microphones about the stage and on the other end of the line connect a loud speaking telephone in order to listen to the transmitted music, it is quite a different problem to connect say *twenty or forty thousand* subscribers' lines to these microphones and then reproduce the music at the end of *all* these thousands of circuits. The reason is that heretofore we had no satisfactory instrument whereby the

(*Continued on page* 924)

Copyright, 1919, by E. P. Co.

Due to the Invention of the Audion, It Is Now Feasible From a Technical Standpoint to Connect to One Stage As Many As Fifty Thousand Telephone Subscribers, All of Which Can Listen Simultaneously to Our Great Opera Stars. The Invention of the Loud Talking Telephone Also Has Made It Possible for the Entire Family to Hear the Music As Pictured Above.

www.americanradiohistory.com

New York to Chicago Via the Air in Twelve Hours

"AIRLINE TICKET for Chicago, Please." "Yes, sir; five hundred and twenty dollars. Please. The next 'liner' leaves in half an hour for Chicago and way stations," replied the ticket agent of the *Trans-Continental Airline Company* on a bright June morning in the year 1919. At least that is a fair sample of the conversation we may find quite common in a few months or so, if the plans of one of the largest aërial transportation organizations materialize in any such manner as their originators predict. Complete arrangements for the construction and operation of a line of passenger carrying dirigibles between New York and Chicago at an initial charge of sixty-five cents a mile for each passenger have been made by J. M. McElroy, chief engineer of the Sturtevant Aeroplane Company, of Boston, in collaboration with Noble Foss, one of the officials of the corporation and a son of former Governor Foss, of Massachusetts.

Announcement of the big undertaking was made recently by the Massachusetts Aircraft Association, which held its annual aeronautical exposition at Madison Square Garden and the Sixty-ninth Regiment Armory from March 1 to 15, inclusive, in co-operation with the War and Navy Departments.

It is proposed to form a company with four dirigibles and two main terminals, one at New York, the other at Chicago. The dirigibles are to be of the Zeppelin type, with rigid housing and multiple compartment structure. The U. S. War Department's wonderful new discovery, Helium gas, will be used, thus removing the danger of fire. The airship will be 425 feet in length and forty-five feet in diameter. Its engines will have a horsepower of 1,200. The bag will have a capacity of 650,000 cubic feet of gas, providing a gross lifting power of twenty tons at sea level. This would mean a practical net lift of ten tons.

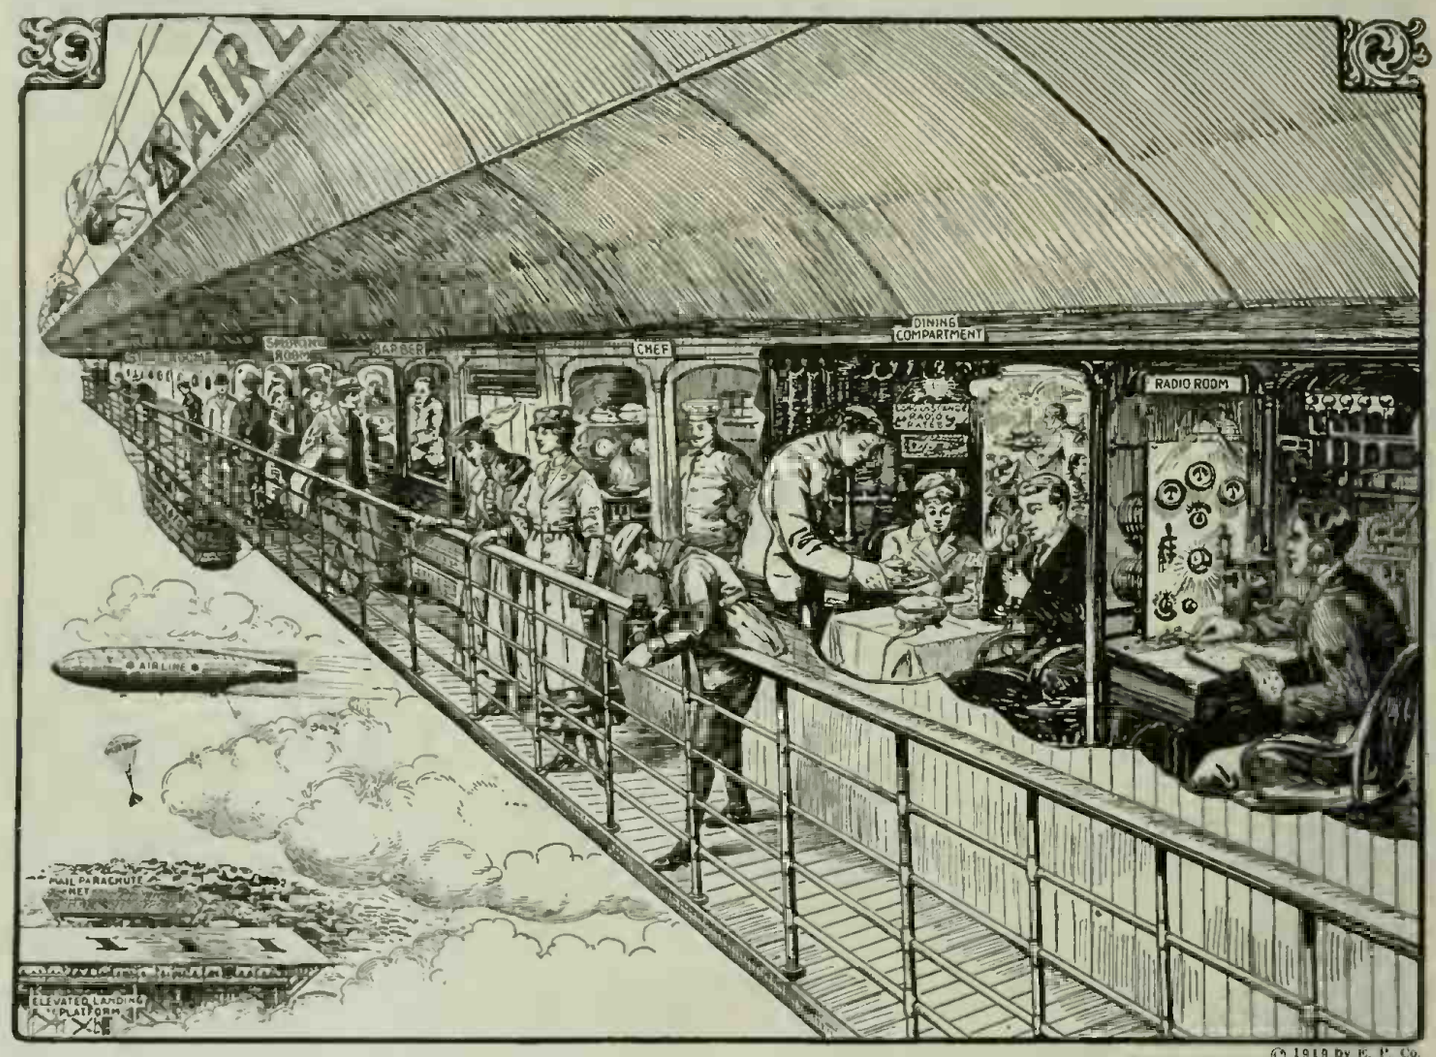
It is estimated by Mr. McElroy that a speed of seventy miles an hour can be maintained and that the trip from New York to Chicago could be made in comfort in less than twelve hours.

"The cost per mile, roughly speaking," says Mr. McElroy, "would approach sixty-five cents per passenger, or $520 for the entire trip in either direction. There is no doubt but that after the line is run for some time, it will be possible to cut down the rate considerably."

Each dirigible will have accommodations for twenty-five passengers. The power plant will consist of two engines, side by side, driving thru gears a central stub shaft mounting a variable pitch air screw. Balance and altitude will be adjusted by expansion or compression of the gas.

The crew will consist of the captain, navigator, chief and two assistant engineers, wireless operators, steward, cook, waiter and maid.

In regard to the landing places, which with dirigibles is a great problem, Mr. McElroy says:



"It is reasonable to believe that hill walled landing zones could be located, or natural depressions in the earth could be enlarged to offer breakairs to permit the air liner to come down safely. The terminals at either end of the New York-Chicago route could be floating piers secured at one end, so as to swing with the wind to permit easy housing of the ship."

With regard to the possibility of trans-Atlantic flight, Mr. McElroy says:

"When we have put the New York-Chicago route into successful operation then it is time to throw a line across the pond and do a real job."

Apropos of transcontinental aërial transportation we find much food for thought in a speech recently made by Allan R. Hawley, president of the Aero Club of America, before the National Rivers and Harbors Congress, at Washington, D. C., on

Guiding Airships With the "Radio Barrage"

Invisible Walls of the Ether

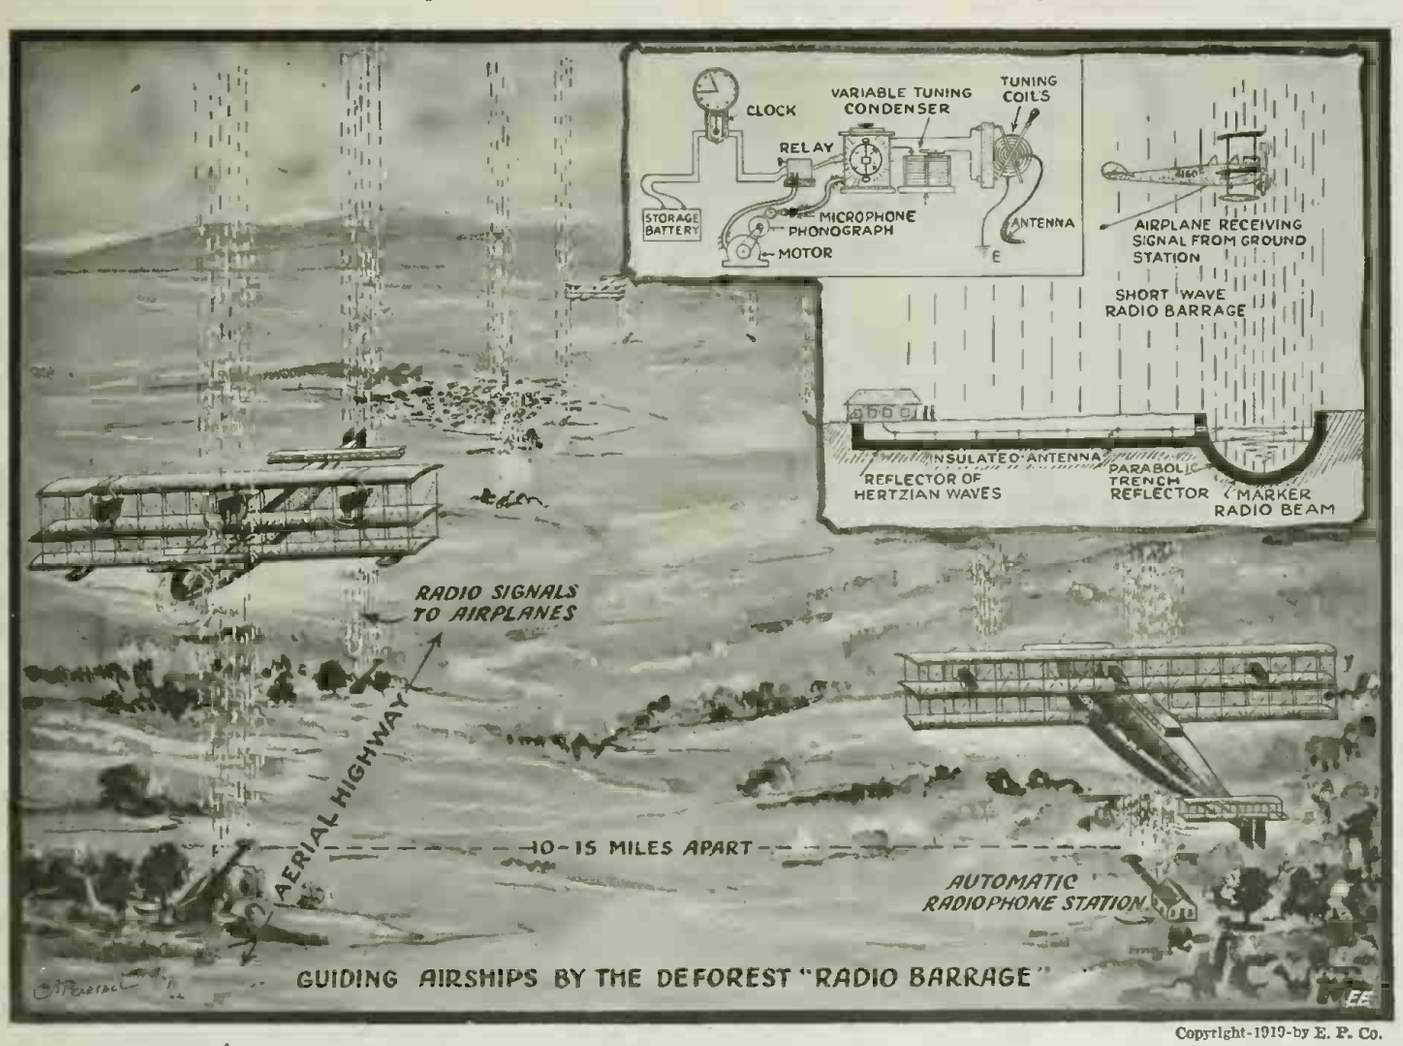
By DR. LEE de FOREST

JUST at this time, when our army and navy officials, and many airplane builders, are taking steps for the commercial development of the airplane and dirigible, along industrial and governmental lines, is it not practicable, as well as advisable for radio inventors and engineers, as well as others concerned, to give thought to those essential safety devices which come within the scope of radio-communication and control?

I venture to say that if there was any one device used in the European war which contributed to the success of the Allies in their supremacy of the air, it was radio-communication, both telephone and telegraph. By means of it the fighters in the air were at all times able to talk and signal with their commanding officers at headquarters, and after a personal examination of the various kinds of apparatus used by the different countries, all of which pay high tribute to American genius, I feel I am fully justified in predicting an even greater use of radio control and communication for peace purposes.

One of the first questions to be taken up, it seems to me, when we have reached the point of regular passenger and freight traffic by air, is that of proper warning to pilots in case of fog, cloud or other interferences. Will it not be necessary, for example, to establish a regular "traffic squad of the air," for those cities in the principal lines of communication? The use of the human voice in sounding a warning, without wires, is already an accomplished fact; at Point Judith Light, where the *Radiophore*, at regular intervals, calls out to the ship operator: "Point Judith Light," and then in a weaker voice: "You are getting closer—Keep off."

By means of a number of wireless stations placed around any given city, why cannot we do likewise in the matter of our radio traffic squad of the air? So that when a pilot comes within range, he would receive a message such as the following:



"Buffalo Office—Turn West by South, and Pick up Cleveland," or again such warnings as, for example, it will be necessary to inform the pilot of weather changes: "Weather Warning—Your are nearing a storm area—Cyclone Ahead," etc., etc.

There should be, no doubt, a continual "radio barrage," or zone of automatic warnings thru which airplanes must pass in approaching regions where air traffic is dense; namely, around landing stations, and especially so near steep mountain ranges and peaks, or cities like New York, with extraordinarily tall buildings with consequent air pockets.

By arrangement of antenna or reflectors not unlike those used behind large searchlights, a beam, or narrow zone of wireless waves, invisible to the eye of course, could be set up. This would necessitate the use of very short wave lengths, of only a few meters, far shorter than the wave lengths used today in radio-communication. This feature would also have the advantage that these short wave lengths would not interfere at all with existing radio-communication. All this short wave vertical radiation would be controlled by the automatically repeating phonograph, similar to the *Radiophore* arrangement at Point Judith Light.

The pilot of the airplane, his 'phone clamped to his head in the helmet, would hear these safety signals as he flies thru these invisible walls of etheric warning, in ample time to govern his course accordingly.

With the mastery of the air for governmental, and for commercial purposes, already at hand, certainly the question of radio control, and of traffic regulation, is of prime importance, worthy of the immediate interest, and of the best thought in the radio world.

Copyright-1919-by E. P. Co.

The Airships of Tomorrow Will be Guided by Wireless Telephone Signals, Possibly Arranged in "Barrages" or Walls, as Here Illustrated. This is the Only Feasible Way of Signaling Location and Weather Data to Aërial Craft in Stormy and Especially Foggy Weather. Prof. Walter I. Schlichter, of Columbia University, Has Also Recently Advocated the Use of Powerful Wireless Signaling Stations for Guiding Trans-Atlantic Seaplanes in Their Proposed Trips Across the Ocean.

How Electricity Serves World's Largest Hotels

Do you know that the two largest hotels in the world have just opened in New York City, each one with over 2,000 guest rooms and a bath in every room? One of these hotels has, among other startling new features, an electric automobile elevator, which carries the guests' motor cars up to the grand ball room floor, so that milady and her escort do not have to pass thru any chilling winds when arriving at the hotel. These hotels are veritable cities in themselves, and either of them has more telephones than the entire nation of Greece. One hotel has the largest electric laundry in the world, not to mention the gigantic dining rooms, ball rooms, kitchens, swimming pools, children's open-air playgrounds, and a whole regiment of employees.

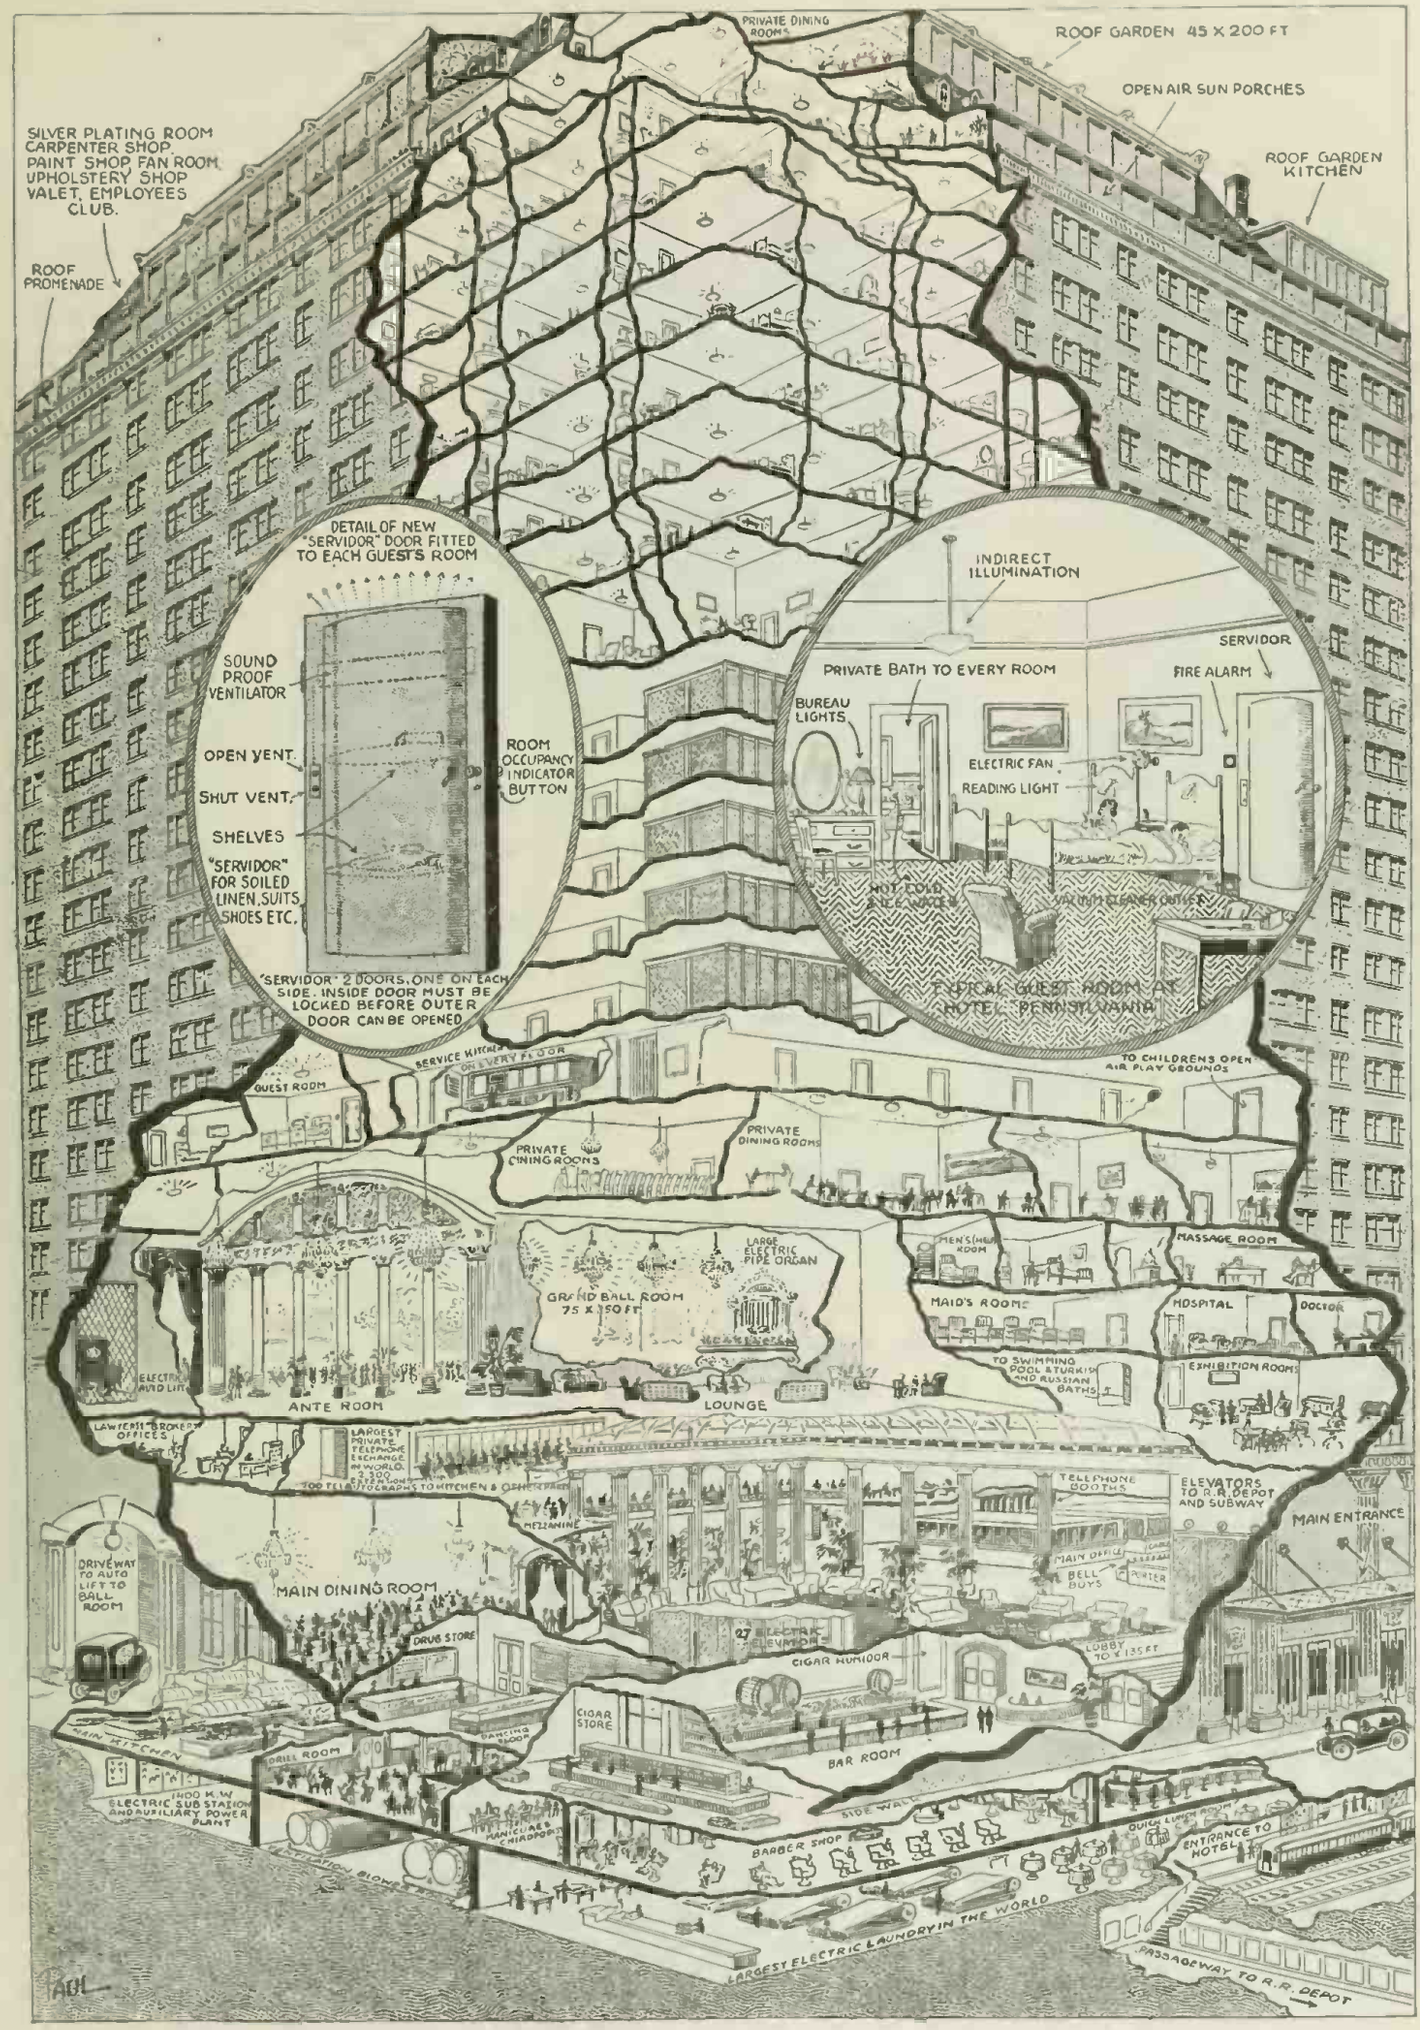
By H. WINFIELD SECOR

THE two largest hotels in the world recently opened in New York City, one, the "Hotel Pennsylvania," opposite the Pennsylvania Railroad Terminal at 33rd Street and 7th Avenue, and the other, the "Hotel Commodore," located adjacent to the Grand Central Terminal, and built directly over both the Queensboro and Lexington Avenue subways. There are so many hundreds of innovations and conveniences which have been developed and applied to these—the last word in Hoteldom—that one can hardly judge of the undoubted value of all of these important and elaborate appointments without having actually visited such an establishment in person. Take, for example, the gigantic proportions of the Hotel Pennsylvania with its 2,200 rooms and bath. This hotel can accommodate 3,500 registered guests with rooms, not to mention several dozen additional small-town populations, which it can easily entertain in the grand ball room and its six well appointed restaurants, also numerous private banquet rooms and private dining rooms, not forgetting the roof garden, which is one of the most beautiful and perhaps the largest in the world, Besides a capacity of 3,500 guests with rooms, 3,000 additional guests may be entertained in the several restaurants including the roof garden, or the total capacity of 6,500 guests, which is a respectable little city all by itself.

If you haven't already visited one of these magnificent and beautifully appointed 20th century hotels, you will probably wish to know what conveniences are provided for the guest, and with that very object in mind, the writer paid a special visit to these establishments and enjoyed an afternoon off from the editorial rub-dub, amid the flowering palms and the aroma of one dollar Havana perfectos arising from the "loungees" reclining luxuriously on the thousand dollar leather settees, which grace the main lobby. This wonderful lobby is furnished in handsome imported marble and is lighted by reflected beams passing thru a richly designed leaded glass ceiling. Both the Hotel Pennsylvania as well as the Hotel Commodore have the same transit facilities, i.e., both have subway as well as railroad service, the one the Pennsylvania Railroad, and the other New York Central Lines. There are underground passageways in either case leading from the railroad terminals directly into the hotels, and special elevators for this service to carry the guests to the floor of the main lobby or vestibule. If one arrives by subway from up or downtown New York, he finds the same conveniences awaiting him, and is whisked from the subterranean passageway to the splendor of the main lobby by elevator, which is operated by young women nattily attired in spic and span uniforms. There is even a woman "elevator starter"—and speaking of elevators, the Hotel Pennsylvania boasts of a total of 27. In the following description of the hotel features, as the writer found them, the Hotel Pennsylvania is inferred, except where otherwise mentioned.

On arriving on the floor of the main lobby, which is certainly a magnificent piece of architecture, one finds that the principal and most important conveniences of the hotel are at once available. Among other appointments immediately accessible and available from the lobby are the main Dining Room, the Palm Room, used for afternoon teas, etc., the men's café, the men's bar, the grill room, and in the basement the most attractive barber shop imaginable, resplendent in handsome tile and marble with leather lounges, and adjacent to these the handsomest array of lady manicurists ever seen this side of Paris. While dining in the grill room, you may, if you wish, have a one-step or *two* with your guest on the highly polished dancing floor in the center of the room, while the Original Dixy Jazz Band turns loose the jazziest jazz you ever shook a foot to. Considering for the moment that some rainy afternoon you might happen to pop in at the "Pennsylvania" from the water-proof subway, and that you might find at arriving in the royally appointed lobby that your capital was limited to the large sum of 15c, due perhaps to the efficient activities of an unknown pickpocket on your ride up to the hotel, you can still enjoy yourself ostentatiously by repairing to the basement floor, where there is a "Quick Lunch Restaurant," which will accommodate several hundred guests, who may for one reason or another wish to enjoy a 15c or 25c meal. That is what you call real service, and both of these hotels are out for service with a capital "S," first, last and always. Later, when you are assigned to the guests' floors and see the layout of the rooms, you will find that these hotels undoubtedly count on a heavy, transient traffic, the suites in most cases consisting of from one to three rooms and a bath.

The lower part of the hotel is well shown in the accompanying illustration, and of course there are many rooms and conveniences not shown for obvious reasons, owing to their location on other parts of the mezzanine floors, et cetera, which cannot be brought out in the limited size of our illustration. The mezzanine floors, just above the main or street floors, contain the private offices, and also there are sleeping and living quarters on these floors for the employees. On the first mezzanine floor there are exhibition rooms for business purposes, and on the second and third mezzanines dining rooms for the employees. On the third mezzanine we find the "Grand Ball Room," which is most beautifully decorated in pleasing colors which do not jar or irritate the eye as do some of these large public rooms in similar establishments. The general decorative scheme thruout the hotel, it may be said, is one of good taste and extremely homelike. The service is carefully worked out to give this feeling at every turn.



The largest private telephone exchange extant, with capacity for 3,340 extensions, 260 trunk lines and 23 operators is connected to the various rooms and other parts of the hotel, and this is located on the second mezzanine floor.

In the telephone exchange are also located a large battery of "Telautographs"—the electric machines that write—and both of these recently opened hotels have been very lavish in their telautograph equipment. The Hotel Pennsylvania has at present some 200 telautographs, and more will undoubtedly be added later as demands require them. The telautograph equipment at this hostelry has been very carefully worked out by skilled engineers, and it undoubtedly is one of the best that the writer has ever seen put into operation. More will be said with reference to the telautograph system anon, and for the present it will be of interest to the reader to note what happens when a guest is to be paged. In most hotels, at least in the smaller hotels, a guest is not paged except in the main lobby and dining room, but at the "Pennsylvania", when an outside party or a guest calls up the telephone exchange, and the operator writes down the name of the person who is wanted, the following operations ensue: the telephone operator,—(and they are all good looking, take it from your Uncle Dudley, for he had the good luck to actually visit this "holy of holies", past the door of which no man may enter, excepting that he has a pass signed by the powers that be in the telephone world),—proceeds to write the name on the *transmitting* platen of her telautograph, there being a telautograph for each of the 23 telephone operators, and simultaneously the written name appears in the main dining room, grill, bar, roof garden and the office, as well as at the bell captain's office in the main lobby, so that when the name is called out by one of the bellhops in your vicinity, you can rest assured that the same name is being called simultaneously in about ten other parts of the building. This of course, serves two purposes; it promotes speed in locating the guest, which is sometimes a very important factor, and also owing to the multiplicity of the system, it renders trebly certain the locating of the desired party, which would not be the case under ordinary conditions.

The total amount of electric power, not to mention the steam used for heating, is truly enormous in a building of this size, which covers a whole city block, and while talking to the chief engineer of the building, it was ascertained that the total light and power load for the hotel would require as much as 1400 K.W. or about 1900 horsepower. Electricity is used in a general way for many purposes and important operations conducive to the efficient operation of the hotel, which the average guest never sees or even dreams of. For instance, how do you suppose the ventilation of such a large hotel as this is taken care of? The chief engineer answers this question by taking you down to the sub-basement two stories underground, where you see one of the largest electric motor-driven blower rooms in the world, covering a quarter of a square city block. Here dozen of powerful electric motors rated at anywhere from 25 to 50 horse-power each, drive gigantic blowers or fans, each of which is connected up with certain air ducts leading to various parts of the building. Thru these ducts, air is pumped which promotes the proper circulation thru the hallways, and the rooms of the building. Neither of these monster hotels has a large power plant of its

Seeing Thru You Without X-Rays

The New Shadow Photography

By BATTELL LOOMIS

WHAT of the infra-red ray in photography? Is its penetrative power the equivalent of the ultra-violet, or actuating principle of the X-ray? Has Dr. Paull S. Hunter, former State Secretary of Health for Colorado, and hailing from the city of Denver, stumbled on something he didn't know and doesn't know yet, in looking for something he had guest? That is a question it may take time and development to answer, but which the writer is content only to raise by way of introduction to a story which has its element of humor because tho it relates a serious discovery, worth thousands of dollars to society at large, the discovery will not realize its discoverer one penny. In which it is not unlike many other important scientific discoveries.

One night Dr. Hunter was waiting for a car. He held a flashlight in his hand, and covering the ray, was attracted by the marked red glow of his flesh. He noted the dim shadows of the bones in his fingers. "Hm," said he, "the red rays come thru. If the rays were more vivid, the shadow of the bones would be sharper. I can intensify them and I'll bet I can photograph that."

Hold Your Hand Before a Flashlight In the Dark—You Can See the Bone Outlines Dimly. This Is the Basis of the New X-Ray-ess Bone Photography Here Described.

The idea took hold. The doctor was a user of the X-ray, but he found it easier in ordinary practise to bring a patient to the ray than to take the weighty apparatus with its cells and coils to the patient. What a boon to the country doctor it would be if he could make a fracture diagnosis with an ordinary camera! The X-ray is of value only to the rich and the very poor who receive free treatment. The middle class must pay more than it can afford or go without.

So Dr. Hunter seized the first opportunity to lay his hand on a naked *panchromatic* photo plate and expose it to the electric light for a moment. He secured a picture of his bones with his first try. It was not very sharp, but it was a good beginning. He reasoned it out: "It wants only a concentrated *light from a point* to cast a clearer shadow. This ray must go thru a camera which protects the plate from random rays and I have a good bone picture," he argued.

Accordingly he employed his mechanical knack to construct a black box with an opening at one end large enough to receive his hand or foot. See illustration of the apparatus used by Dr. Hunter, herewith. He made it collapsible so it would fit in a physician's grip. He fitted an iris diafram in the top of his box and fastened a plate-holder on the bottom with a developing box beneath that, into which the plate might fall the instant of its exposure, for speedy developing. He then secured a Wratten F or extreme red ray filter and placed it above his lenseless shutter and diafram. He placed his hand over the plate, tied a black cloth at the open end about his elbow, turned on the electric light, removed the slide from the plate-holder, and squeezed his bulb for a half second exposure. The result was the excellent bone picture shown herewith.

This picture was *taken entirely with a filtered light*—the light that passes most easily of all visible light, thru blood. The discoverer has made nothing new except his camera, which is not essential to success He has merely combined a stock Eastman panchromatic photo plate brushed with eosin solution to intensify its sensitiveness, with an F ray filter and a fine point of light to do simply what Röntgen earned his fame for doing in a more roundabout and costly way. He has made a discovery which he prophesies every schoolboy will at once begin to play with, and every doctor to use in his business.

And he has given his discovery freely to the world. He does not intend to secure patents either on his combination of materials or on his novel folding camera, which may be made in any size and open at both ends to fit different portions of the limbs. Whether the rays will penetrate the trunk for abdominal and intercostal examinations he does not know from practise, altho from theory he contends they might be made to do so by improved technique, such as a more intense ray of light and a more sensitive plate.

Further Dr. Hunter has to say:

"My claim is apt with a box fitted out in this manner and a box of panchromatic plates a physician can tell whether a broken arm is set right before leaving the house, and that it will undoubtedly be used all over the country for that purpose.

"The machine can be improved by using a roll of film if the manufacturers would make it, and so do away with glass plates; the developing tank at the bottom would be adapted to films. The whole outfit is, moreover, made to fold up flat and occupy very little space.

"These pictures could also be made with a camera using a powerful arc lamp to throw the rays thru the human body, and if plates could be made sensitive enough, pictures of the heart's action could be made on celluloid rolls, giving moving pictures of the heart action and other organs of the body. So far I have only used it for extremity work and it has proved very satisfactory; in fact, the first pictures are as good if not better than the first ones made by the X-ray.

"I give the idea to the world with the hope that someone will further develop its usefulness and by improved design and more sensitive plates be able to make pictures as well with this $2.00 outfit as with a $1.000 X-ray machine."

IF you are old enough, you will probably remember the time when the X-ray was first announced. We all thought it one of the most marvelous inventions ever conceived by the human mind, and so it was indeed. But now Dr. Paull S. Hunter announces a strikingly simple way to perform the same experiment which Dr. Röntgen performed in a very difficult, roundabout way. Where Prof. Röntgen used a complicated electrical apparatus in order to take shadowgraphs of the human body, Dr. Hunter uses nothing but plain light rays. There is no doubt in our minds that if sufficiently powerful light rays are used in connection with a heat filter in order that the patient does not sustain burns, it should become possible in the near future for physicians to actually see every bone in the human body. Not only this, but we predict that by using certain color rays, it should be possible to bring out every organ in the human body as well, such as heart, liver, blood vessels, etc., which are now very difficult of observation by the X-ray.

Our front cover shows what is already possible today if you will drape the human body in such a way as to cut off all the direct glare, and then by exposing strong electric arc-lights from behind, it becomes possible to see the bones of the body clearly. Dr. Hunter, who is an American physician, deserves great credit for bringing about this extraordinary result, as simple as it is efficient. The accompanying article explains the system and methods fully.

EDITOR.

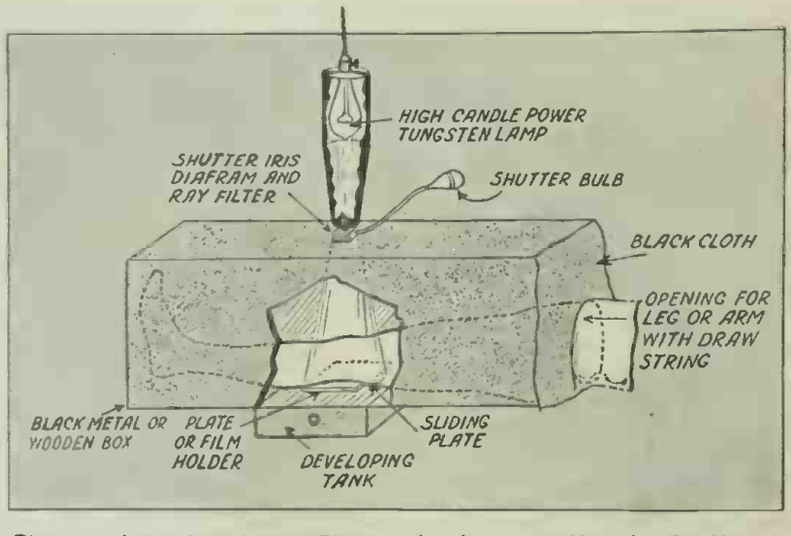

Diagram of the Actual Bone-Photography Apparatus Used by Dr. Hunter in Successfully Photographing the Bones of the Limbs.

www.americanradiohistory.com

The front cover picture, showing the bone structure of a woman, gives us a clear idea of how the full figure would appear, using of course, a sufficiently strong light source, such as an arc lamp. A frisket or template would be cut out to just fit the outer contour of the body, thus giving the maximum X-raying power available in any case. The fleshy portions of the body would appear red just as our artist has shown them, in contradistinction to the usual X-ray image observed in a fluoroscope, where the outline of the flesh is just discernible. It would seem that this new direct light system of bone photography would be much less harmful to the patient, as the X-rays exert a detrimental effect when applied in reasonably large dosages, and in some cases cause growths and burns which are incurable.

Actual Bone Picture of the Hand Taken by the Inventor of the New System of X-Ray-less Bone Photography—Dr. Paull S. Hunter, with a Strong Electric Light, a Red Ray Filter and a Photographic Plate.

WAR ACHIEVEMENTS OF U. S. SIGNAL CORPS.

When the American forces came to France "communication" was one of the first efforts to which American ingenuity and invention was directed and the Signal Corps, under which communications fall, met it as have the organizations of the American Expeditionary Force. Existing French telegraph and telephone systems were overburdened. There was little left for Uncle Sam and Brig. Gen. E. Russell, chief signal officer, and his staff of experts tackled the job.

What they have done in construction is shown in the following statistics: The Signal Corps has built approximately 1,750 miles of poles on which it has strung 4,175 miles of wire. In addition about 2,000 miles of American wire has been strung on existing systems for our use, and it has leased and operates more than 3,000 miles of French wire. Exchange lines to the extent of 12,750 miles have been built, and to operate these lines it has 244 stations, and 102 telegraph offices.

The long-distance telegraph and telephone system constructed by the Signal Corps is entirely maintained by its own personnel, and in addition some 3,000 miles of leased wires are maintained by it.

All this construction has been made by Signal Corps battalions with implements and material from the United States, with the single exception of poles, most of which were obtained in France.

THE JOHN FRITZ MEDAL FOR GENERAL GOETHALS.

The John Fritz Medal Board of Award, composed of representatives of the National Societies of Civil, Mining, Mechanical and Electrical Engineers, held their annual meeting for 1919 at the Engineers' Club, January 17, and awarded their gold medal to George W. Goethals, the builder of the Panama Canal.

The medal has previously been awarded to Lord Kelvin, George Westinghouse, Alexander Graham Bell, Thomas A. Edison, Charles T. Porter, Alfred Noble, Sir William Henry White, Robert W. Hunt, John Edson Sweet, James Douglas, Elihu Thomson, Henry M. Howe and J. Waldo Smith.

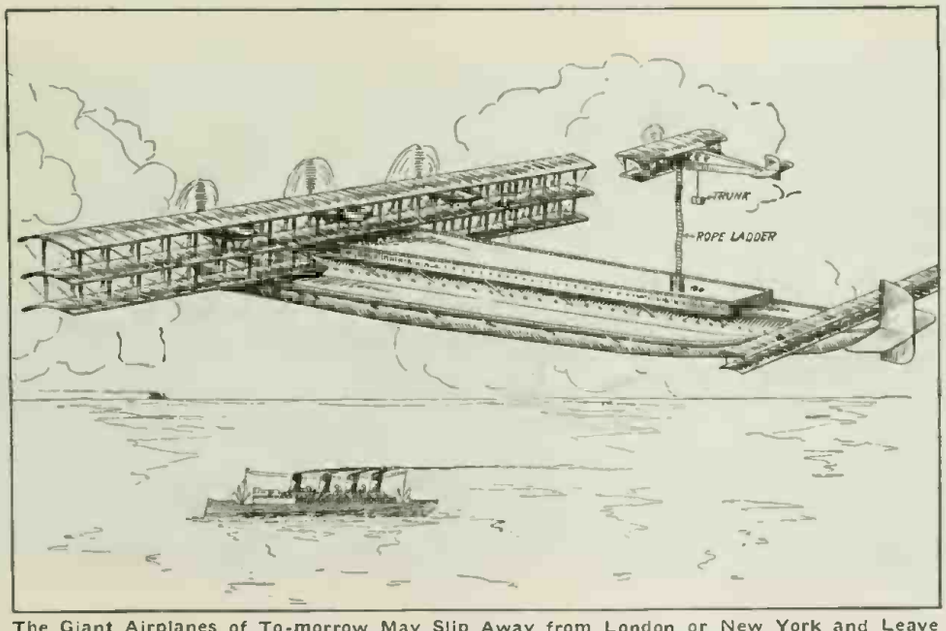
Col. John J. Carty, now in France, has been Chairman of the Board, but in his absence Ambrose Swasey, of Cleveland, presided.

George H. Pegram has been elected Chairman for 1919 and W. F. M. Goss, Treasurer, in place of Prof. F. R. Hutton, who died during the year.

NEW MARCONI INVENTION EXPLAINED.

A joint meeting of the Institute of Radio Engineers and the New York Electrical Society was held on Wednesday evening, March 5, at the Engineering Societies Building, at which Roy A. Weagant, chief engineer of the Marconi Wireless Telegraph Company of America, read a paper on "Reception thru Strays and Interference."

The recent announcement of Mr. Weagant's discoveries and inventions in connection with wireless telegraphy created wide sensation.



THE AERIAL PASSENGER LEFT BEHIND.

WE all know of the taxicab clattering down the street at breakneck speed with the belated passenger making a bee-line for the dock and just arriving in time to see the gang plank pulled in and missing the Liverpool steamer. But the American business man, nothing daunted, by such a trivial occurrence promptly charters a fast harbor boat and races the steamer down the bay, overtakes it and is hoisted up to the deck in time for lunch.

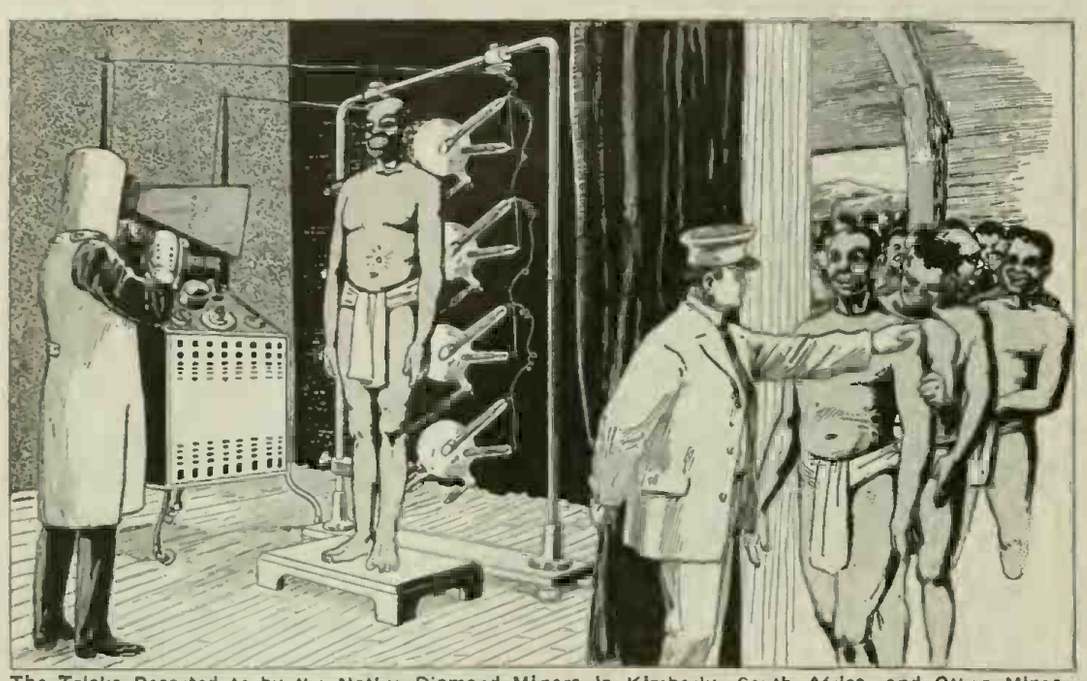
A few years from now humanity probably will not have changed much, and we will still have with us the late passenger, only this time he will not race down to the dock but up a 30-or 40-story elevator trying to catch the Trans-Atlantic Flier, but just in time to see the big bird "take the air."

Will the American business man of 1925 bewail his lot and return dejectedly to his home? Not if he can help it! He will signal a passing *taxiplane* which will come down on the huge platform which a few minutes ago harbored the great Trans-Atlantic flier. Twenty minutes later, the fast little *airliner* will have overtaken the big air monster and after depositing the belated passenger on the upper deck of the European bound flier,—not to forget the violent language of our businessman who thinks he has been overcharged by the modern bandit of the air,—he will go to his deck chair and begin perusing the latest edition of the ELECTRICAL EXPERIMENTER.

While the taxiplane might land directly on the big European-bound flyer, such a method might be more or less fraught with danger. Mr. H. Gernsback suggests that the transfer of the passenger might be accomplished much easier, as shown in our illustration. The taxiplane would fly about twenty feet above the deck of the big flyer, in the same direction of course, *and also at the same speed* as that of the large machine. The passenger could then descend from a rope ladder and drop to the deck with ease, as well as without danger.

The Giant Airplanes of To-morrow May Slip Away from London or New York and Leave You Behind. Then What Would You do? Easy—Board a "Taxiplane" and Chase the "Skyhound" Down the Bay.

YOU CAN WHITTLE THIS IRON.



It is well known that rapid cooling of hot metals hardens them. That the opposite is true has recently been demonstrated in striking fashion by the General Electric Co. One of their scientists annealed American ingot iron surrounded by hydrogen gas for three hours at a temperature above 1,600° F. The product was very little harder than the softest copper, and could be whittled with a jack knife.

One of the largest electric plants in the world is being planned to supply power for nearly all the mines at Johannesburg, South Africa.

www.americanradiohistory.com

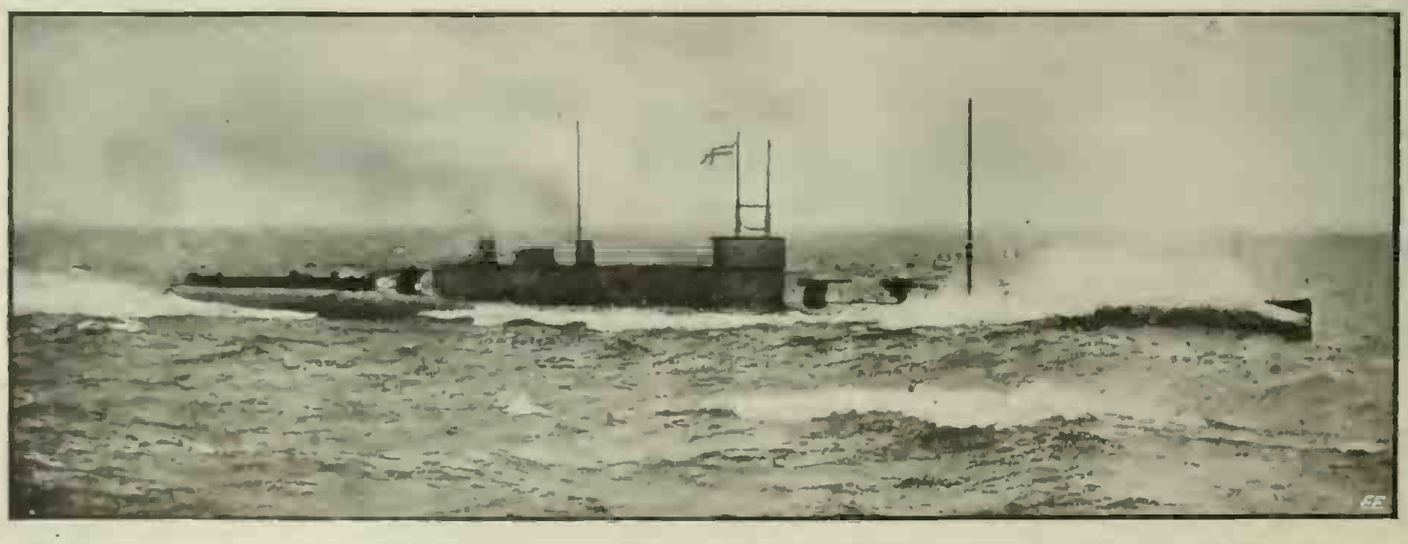
Locating Stolen Diamonds by X-Rays

Possibly you will remember having read from time to time of the remarkable tricks resorted to by the native diamond miners in the great Kimberly diamond region in South Africa and other parts of the world. So great has the temptation often become to steal diamonds, especially when an extra large one may have been suddenly unearthed, that these natives have been known to resort to the most unbelievable tactics in order to carry the diamonds out of the mine and to withstand inspection even when stript, as practically all of them are, before they leave the mine at the end of the day's labor.

The Tricks Resorted to by the Native Diamond Miners in Kimberly, South Africa, and Other Mines, Pass All Human Belief and Imagination at Times. Cases Have Been Known Where the Lucky Finder of a Particularly Fine Specimen Even Swallowed the Stone, Intending Presumably to Regain the Diamond Later. In Some Instances Diamonds Have Been Secreted in Self-Inflicted Wounds or Incisions in the Leg. But the X-Ray Spoiled All These Clever Ruses as Soon as It Was Adopted for Examining the Miners Every Day, Before They left the Mines. The Eye of the X-Ray Sees All.

One of the successful schemes which has been worked out by the superintendent of a large South African diamond mine is shown in the accompanying illustration, and it involves the use of a powerful X-ray machine having several X-ray bulbs excited simultaneously. As each miner passes before the X-ray bulbs, the examiner looks thru his fluoroscope and rapidly swings it up and down, so as to take in the entire body in a few seconds. This system of detecting the presence of a diamond, no matter whether it is buried in the flesh, resting in a throat cavity, or even in the stomach—an almost unbelievable practise resorted to in several instances on record—the X-ray examination quickly indicates the presence of the diamond.

Of course, the logical question that arises is—How can the X-ray detect the presence of a diamond inside of the body; especially when it may be temporarily lodged by the clever thief in proximity to large or fairly large bone structures, which would seem to preclude any possibility of detecting the precious stone? However, a perusal of a table showing the various transparencies of different materials under the X-ray will give the solution to the problem. It has been found that the diamond has a different transparency than any ordinary materials, including the bone and flesh of the body, which might happen to be in proximity to it at the time of such an X-ray examination. Also the diamond is a most peculiar substance, and it has certain fluorescent properties which render the facility of its detection all the more possible under an examination by X-ray, as it has a tendency to fluoresce or glow slightly when under the influence of X-rays, which phenomenon is readily detected on a sensitive fluorscope or X-ray screen.



The X-ray machine here shown is connected to a battery of four powerful X-ray tubes of the latest Coolidge type, as otherwise if the tube had to be moved up and down behind the subject, considerable time would be lost in performing this operation, and where several hundred subjects have to be examined in a very short space of time, it can readily be imagined that such a device as here shown is imperative.

GIANT SUBMARINES HAVE 12-INCH GUNS AND STEAM PROPULSION.

We are now able to publish a photograph of one of the most jealously guarded secrets of the British Navy. While the Germans were boasting of the huge under-sea cruisers with which they proposed to gain the control of the seas, the British Admiralty were constructing submarines capable of matching the largest destroyers afloat and of fighting even cruisers in a surface contest.

The secret of these boats was their great size and speed and the fact that while on the surface they used steam as their propelling power, carrying two funnels like an ordinary surface warship. One photo shows a British "K" class, two funnel submarine "steaming" on the surface at sea. This is the largest class submarine produced by any nation and is 340 feet in length. It outclasses any U-boat built by Germany. Great Britain has a whole fleet of these sea terrors. Storage batteries and motors are used while running submerged.

The other photo shows a new British monitor submarine with a 12-inch gun, capable of giving battle to most any class of armed ship under favorable conditions. So far as known this is the first photograph to be received in this country showing Great Britain's combination of the U-boat and coast defense vessel. The 12-inch gun is the largest that was ever mounted on a submarine.

The Latest British Style in Submarines. It Is Capable of a Speed of 24 Knots on the Surface, When Propelled by Its Steam Power Plant. The Two Smoke Stacks Fold Down When the Submarine Submerges, and It Is Then Propelled by Storage Batteries Previously Charged While Running Awash. This Giant Craft Is 340 Feet in Length, and Is Armed with Three 4-Inch Guns, Two Forward and One Aft, as the Photo Shows. The Displacement of This Boat When Submerged Is 2,700 Tons and the Speed 10 Knots.

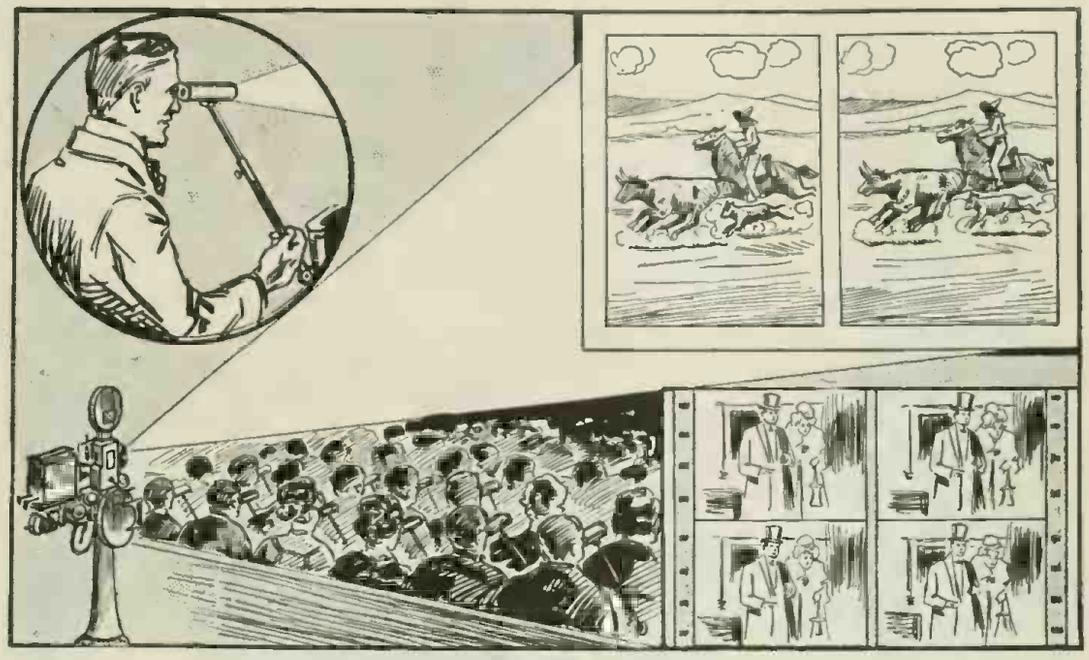
www.americanradiohistory.com

GERMAN RADIO FOR HOLLAND STATION.

Details of the giant wireless telegraph station to be erected in Holland by German interests for the purpose of facilitating communication between Holland and her East Indian possessions, according to a contract recently concluded between the Dutch Government and the Telefunken Company of Berlin, are found in a recent issue of Commerce Reports.

Paul L. Edwards, Commercial Attaché at The Hague, reports that the receiving station of the new plant, which is expected to cost about $2,000,000, will be at Boxmeer, in the Province of North Brabant, and the sending station will be located on a hill at Kootwijk, Province of Gelderland, near Apeldoorn, some thirty-five miles from the receiving station. The sending station will consist of six steel towers, each 200 meters (about 688 feet) in height. The *Radio-Nieuws* says that the Kootwijk sending station will have the same range as the German station at Nauen. The installation will be able easily to transmit to and receive from a station of like dimensions and capacity which is shortly to be built at Bandoeng, Java. The distance between the Kootwijk and the Bandoeng station is about 6,830 miles.

It is understood that an engineer representing the Telefunken Company is in Java with a view of supervising the construction of the station at Bandoeng. *De Nieuwe Courant* stated some time ago that all of the apparatus and raw material for the construction of the Bandoeng station were in Berlin ready for shipment at the first opportunity.



INSTRUMENT DISCOVERS COMING STORMS AT SEA.

A barocyclonometer, which locates the center of typhoons and other storms, and also indicates when they are due, and from what direction, has been invented by Father Jose Algue, director of the Manila Weather Bureau, and, according to Capt. A. W. Nelson, of the Pacific mail steamship *Ecuador*, is being used in safeguarding from storms numerous vessels plying in Chinese and Japanese waters.

Stereoscopic Movies

The accompanying illustration shows a possible later-day development of the present moving picture, which, altho it has been greatly perfected in the past few years, leaves considerable detail yet to be worked out. No matter how clear or flickerless a motion picture may be when viewed on the screen as projected by modern moving picture machines, it would still be one hundred per cent more perfect to our vision, if it could be thrown on the screen in duplicate or stereoscopic fashion in a similar manner to the parlor stereoscopes which we have all seen and used. Of course, if we ever do get to the stage of stereoscopic movies, then undoubtedly it will be necessary for the theater proprietor to provide or make readily accessible, by means of slot machines arranged on the back of the theater chairs, etc., a special small size stereoscope similar in appearance to a pair of opera glasses, thru which the duplicate moving images on the screen could be properly viewed and focust. These would of course be fitted with proper lenses for the purpose.

It might seem off-hand that this latter refinement would be unnecessary, but it is really one of the great marvels of science that causes us to see the images stand out, as it were, from the picture, when we look thru a stereoscope at the photographs or other views mounted in duplicate. The stereoscope operates on a very simple and yet peculiar physiological arrangement, based on the inter-action of the optical powers of the two eyes when they are focust on two properly made and similar images.

Of All the "Movie" Inventions That Have Past OurWay, We Have Yet to See Exploited, at Least Commercially, the "Stereoscopic Movie." If You Have Ever Used a Parlor Stereoscope Then You Will Appreciate What a Wonderful Improvement This Idea Would Make in the "Movie" Show, for Then the Figures Would Actually Stand Out in Relief. A Special "Stereoscope" Would Be Placed on Every Seat. Try This Experiment—Hold a Small White Card Vertically Between the Two Similar Views Here Shown, Move the Page Up and Down Until the Images Appear in Relief.

The names of the manufacturers of new devices and appliances in which readers are interested will be furnished free of charge by addressing our TECHNICAL INFORMATION BUREAU.

Here's the New British "Monitor-Submarine." It Sports a Dangerous Looking 12-Inch, 50-Ton Gun, Which Can be Traversed 6 Degrees. It Was Built for Bombarding the Forts at the Dardanelles Straits. This is the Famous "M-1," a 1,700-Ton Subsea Craft That Would Make Any Light Cruiser or Similar Warship, Not to Mention a Dozen or So Armed Merchantmen, Scratch as They Never Scratched Before. She Carries, Besides the 12-Inch Gun, Two Torpedo Tubes and an Anti-aircraft Gun, and Several Other Surprises Which Heinie Never Even Dreamed About.

My Inventions

By Nikola Tesla

III. MY LATER ENDEAVORS

The Discovery of the Rotating Magnetic Field

AT the age of ten I entered the Real Gymnasium which was a new and fairly well equipt institution. In the department of physics were various models of classical scientific apparatus, electrical and mechanical. The demonstrations and experiments performed from time to time by the instructors fascinated me and were undoubtedly a powerful incentive to invention. I was also passionately fond of mathematical studies and often won the professor's praise for rapid calculation. This was due to my acquired facility of visualizing the figures and performing the operations, not in the usual intuitive manner, but as in actual life. Up to a certain degree of complexity it was absolutely the same to me whether I wrote the symbols on the board or conjured them before my mental vision. But free-hand drawing, to which many hours of the course were devoted, was an annoyance I could not endure. This was rather remarkable as most of the members of the family excelled in it. Perhaps my aversion was simply due to the predilection I found in undisturbed thought. Had it not been for a few exceptionally stupid boys, who could not do anything at all, my record would have been the worst. It was a serious handicap as under the then existing educational regime, drawing being obligatory, this deficiency threatened to spoil my whole career and my father had considerable trouble in railroading me from one class to another.

Nikola Tesla at 60. A Very Recent Portrait of the Great Inventor. An Excellent Likeness.

In the second year at that institution I became obsest with the idea of producing continuous motion thru steady air pressure. The pump incident, of which I have told, had set afire my youthful imagination and imprest me with the boundless possibilities of a vacuum. I grew frantic in my desire to harness this inexhaustible energy but for a long time I was groping in the dark. Finally, however, my endeavors crystallized in an invention which was to enable me to achieve what no other mortal ever attempted. Imagine a cylinder freely rotatable on two bearings and partly surrounded by a rectangular trough which fits it perfectly. The open side of the trough is closed by a partition so that the cylindrical segment within the enclosure divides the latter into two compartments entirely separated from each other by air-tight sliding joints. One of these compartments being sealed and once for all exhausted, the other remaining open, a perpetual rotation of the cylinder would result, at least, I thought so. A wooden model was constructed and fitted with infinite care and when I applied the pump on one side and actually observed that there was a tendency to turning, I was delirious with joy. Mechanical flight was the one thing I wanted to accomplish altho still under the disconraging recollection of a bad fall I sustained by jumping with an umbrella from the top of a building. Every day I used to transport myself thru the air to distant regions but could not understand just how I managed to do it. Now I had something concrete—a flying machine with nothing more than a rotating shaft, flapping wings, and—a vacuum of unlimited power! From that time on I made my daily aërial excursions in a vehicle of comfort and luxury as might have befitted King Solomon. It took years before I understood that the atmospheric pressure acted at right angles to the surface of the cylinder and that the slight rotary effort I observed was due to a leak. Tho this knowledge came gradually it gave me a painful shock.

I had hardly completed my course at the Real Gymnasium when I was prostrated with a dangerous illness or rather, a score of them, and my condition became so desperate that I was given up by physicians. During this period I was permitted to read constantly, obtaining books from the Public Library which had been neglected and entrusted to me for classification of the works and preparation of the catalogues. One day I was handed a few volumes of new literature unlike anything I had ever read before and so captivating as to make me utterly forget my hopeless state. They were the earlier works of Mark Twain and to them might have been due the miraculous recovery which followed. Twenty-five years later, when I met Mr. Clements and we formed a friendship between us, I told

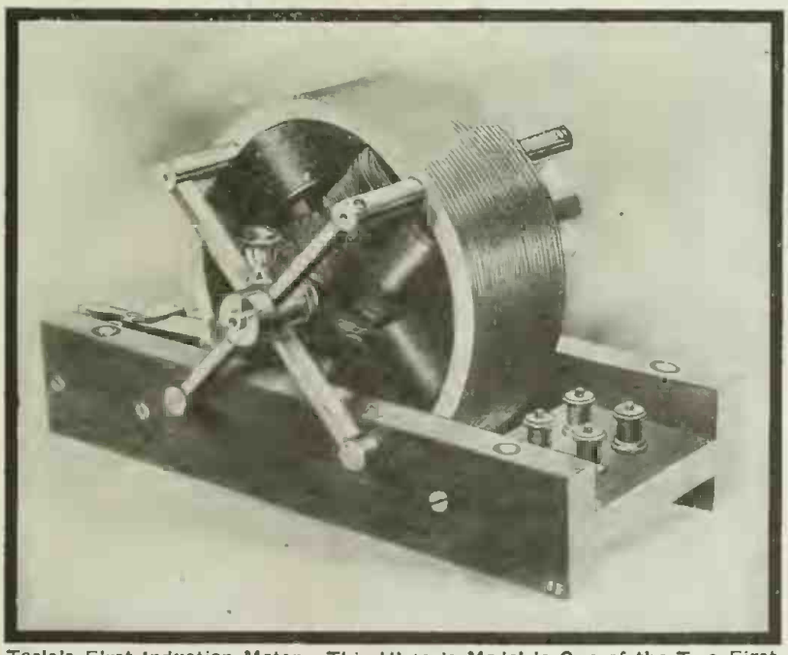
Mr. Tesla's articles started in our February issue

www.americanradiohistory.com

him of the experience and was amazed to see that great man of laughter burst into tears.

My studies were continued at the higher Real Gymnasium in Carlstadt, Croatia, where one of my aunts resided. She was a distinguished lady, the wife of a Colonel who was an old war-horse having participated in many battles. I never can forget the three years I past at their home. No fortress in time of war was under a more rigid discipline. I was fed like a canary bird. All the meals were of the highest quality and deliciously prepared but short in quantity by a thousand percent. The slices of ham cut by my aunt were like tissue paper. When the Colonel would put something substantial on my plate she would snatch it away and say excitedly to him: "Be careful, Niko is very delicate." I had a voracious appetite and suffered like Tantalus. But I lived in an atmosphere of refinement and artistic taste quite unusual for those times and conditions. The land was low and marshy and malaria fever never left me while there despite of the enormous amounts of quinin I consumed. Occasionally the river would rise and drive an army of rats into the buildings, devouring everything even to the bundles of the fierce paprika. These pests were to me a welcome diversion. I thinned their ranks by all sorts of means, which won me the unenviable distinction of rat-catcher in the community. At last, however, my course was completed, the misery ended, and I obtained the certificate of maturity which brought me to the cross-roads.

THIS installment, no doubt the most interesting of the three published so far, reveals many extraordinary occurrences and experiences in the world's greatest inventor's life—experiences such as do not fall to the lot of ordinary mortals. And Tesla, the many sided, aside of inventing, knows the rare art of painting word-pictures. He does so here in a masterly fashion. He tells us how he finally conceived the induction motor—perhaps his greatest discovery—the invention which changed the face of the globe, the invention which made possible the street car, the subway, the electric train, power transmission, the harnessing of water falls and countless others. But let Tesla tell you himself how it all came about. It is a classic worth reading.



EDITOR.

During all those years my parents never wavered in their resolve to make me embrace the clergy, the mere thought of which filled me with dread. I had become intensely interested in electricity under the stimulating influence of my Professor of Physics, who was an ingenious man and often demonstrated the principles by apparatus of his own invention. Among these I recall a device in the shape of a freely rotatable bulb, with tinfoil coatings, which was made to spin rapidly when connected to a static machine. It is impossible for me to convey an adequate idea of the intensity of feeling I experienced in witnessing his exhibitions of these mysterious phenomena. Every impression produced a thousand echoes in my mind. I wanted to know more of this wonderful force; I longed for experiment and investigation and resigned myself to the inevitable with aching heart.

Just as I was making ready for the long journey home I received word that my father wished me to go on a shooting expedition. It was a strange request as he had been always strenuously opposed to this kind of sport. But a few days later I learned that the cholera was raging in that district and, taking advantage of an opportunity, I returned to Gospic in disregard of my parents' wishes. It is incredible how absolutely ignorant people were as to the causes of this scourge which visited the country in intervals of from fifteen to twenty years. They thought that the deadly agents were transmitted thru the air and filled it with pungent odors and smoke. In the meantime they drank the infected water and died in heaps. I contracted the awful disease on the very day of my arrival and altho surviving the crisis, I was confined to bed for nine months with scarcely any ability to move. My energy was completely exhausted and for the second time I found myself at death's door. In one of the sinking spells which was thought to be the last, my father rushed into the room. I still see his pallid face as he tried to cheer me in tones belying his assurance. "Perhaps," I said, "I may get well if you will let me study engineering." "You will go to the best technical institution in the world." he solemnly replied, and I knew that he meant it. A heavy weight was lifted from my mind but the relief would have come too late had it not been for a marvelous cure brought about thru a bitter decoction of a peculiar bean. I came to life like another Lazarus to the utter amazement of everybody. My father insisted that I spend a year in healthful physical outdoor exercises to which I reluctantly consented. For most of this term I roamed in the mountains, loaded with a hunter's outfit and a bundle of books, and this contact with nature made me stronger in body as well as in mind. I thought and planned, and conceived many ideas almost as a rule delusive. The vision was clear enough but the knowledge of principles was very limited. In one of my inventions I proposed to convey letters and packages across the seas, thru a submarine tube, in spherical containers of sufficient strength to resist the hydraulic pressure. The pumping plant, intended to force the water thru the tube, was accurately figured and designed and all other particulars carefully worked out. Only one trifling detail, of no consequence, was lightly dismist. I assumed an arbitrary velocity of the water and, what is more, took pleasure in making it high, thus arriving at a stupendous performance supported by faultless calculations. Subsequent reflections, however, on the resistance of pipes to fluid flow determined me to make this invention public property.

Another one of my projects was to construct a ring around the equator which would, of course, float freely and could be arrested in its spinning motion by reactionary forces, thus enabling

(*Continued on page 905*)

Tesla's First Induction Motor. This Historic Model Is One of the Two First Presented Before the American Institute of Electrical Engineers.

WHAT IS THE INDUCTION MOTOR?

The induction motor operates on alternating current. It has no commutator like a direct current motor, nor slip rings like an alternating current motor. Contrary to the two types just cited the "field" current is not steady, but the current itself rotates constantly pulling around with it—by induction—the only moving part of the motor—the rotor—or armature. Having no armature nor slip rings, the induction motor never sparks. It consequently knows no "brush" trouble. It needs no attention because of its ruggedness. Only the bearings wear out. Its efficiency too is higher. On account of all this the induction motor is used in a prepondering proportion in street cars, electric trains, factories, etc.

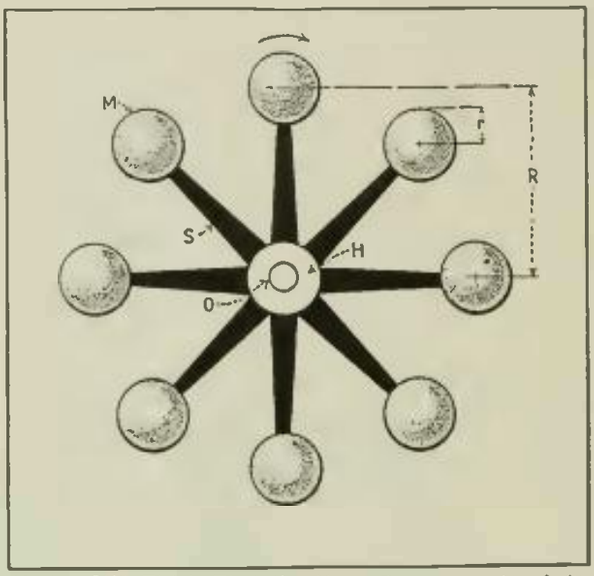
The Moon's Rotation

By NIKOLA TESLA



SINCE the appearance of my article entitled the "Famous Scientific Illusions" in your February issue, I have received a number of letters criticizing the views I exprest regarding the moon's "axial rotation." These have been partly answered by my statement to the *New York Tribune* of February 23, which allow me to quote:

In your issue of February 2, Mr. Charles E. Manierre, commenting upon my article in the *Electrical Experimenter* for February which appeared in the *Tribune* of January 26, suggests that I give a definition of axial rotation.

I intended to be explicit on this point as may be judged from the following quotation: "The unfailing test of the spinning of a mass is, however, the existence of *energy of motion*. The moon is not posest of such *vis viva*." By this I meant that "axial rotation" is not simply "rotation upon an axis nonchalantly defined in dictionaries, but is a circular motion in the true physical sense—that is, one in which half the product of the mass with the square of velocity is a definite and positive quantity. The moon is a nearly spherical body, of a radius of about 1,087.5 miles, from which I calculate its volume to be approximately 5,300,216,300 cubic miles. Since its mean density is 3.27, one cubic foot of material composing it weighs close on 205 lbs. Accordingly, the total weight of the satellite is about 79,969,000,000,000,000,000, and its mass 2,483,500,000,000,000,000 terrestrial short tons. Assuming that the moon does physically rotate upon its axis, it performs one revolution in 27 days, 7 hours, 43 minutes and 11 seconds, or 2,360,591 seconds. If, in conformity with mathematical principles, we imagine the entire mass concentrated at a distance from the center equal to two-fifths of the radius, then the calculated rotational velocity is 3.04 feet per second, at which the globe would contain 11,474,000,000,000,000,000 short foot tons of energy sufficient to run 1,000,000,000 horsepower for a period of 1,323 years. Now, I say, that there is not enough of that energy in the moon to run a delicate watch.

In astronomical treatises usually the argument is advanced that "if the lunar globe did not turn upon its axis it would expose all parts to terrestrial view. As only a little over one-half is visible it *must* rotate." But this inference is erroneous, for it only admits of one alternative. There are an infinite number of axis besides its own in each of which the moon might turn and still exhibit the same peculiarity.

I have stated in my article that the moon rotates about an axis passing thru the center of the earth, which is not strictly true, but it does not vitiate the conclusions I have drawn. It is well known, of course, that the two bodies revolve around a common center of gravity, which is at a distance of a little over 2,899 miles from the earth's center.

If You Still Think That the Moon Rotates on Its Axis, Look at This Diagram and Follow Closely the Successive Positions Taken by One of the Balls M While It Is Rotated by a Spoke of the Wheel. Substitute Gravity for the Spoke and the Analogy Solves the Moon Rotation Riddle.

Another mistake in books on astronomy is made in considering this motion equivalent to that of a weight whirled on a string or in a sling. In the first place there is an essential difference between these two devices tho involving the same mechanical principle. If a metal ball, attached to a string, is whirled around and the latter breaks, an axial rotation of the missile results which is definitely related in magnitude and direction to the motion preceding. By way of illustration—if the ball is whirled on the string clockwise ten times per second, then when it flies off, it will rotate on its axis ten times per second, likewise in the direction of a clock. Quite different are the conditions when the ball is thrown from a sling. In this case a *much more rapid* rotation is imparted to it in the *opposite sense*. There is no true analogy to these in the motion of the moon. *If the gravitational string, as it were, would snap, the satellite would go off in a tangent without the slightest swerving or rotation, for there is no moment about the axis and, consequently, no tendency whatever to spinning motion.*

Mr. Manierre is mistaken in his surmise as to what would happen if the earth were suddenly eliminated. Let us suppose that this would occur at the instant when the moon is in *opposition*. Then it would continue on its eliptical path around the sun, presenting to it steadily the face which was always exposed to the earth. If, on the other hand, the latter would disappear at the moment of *conjunction*, the moon would gradually swing around thru 180° and, after a number of oscillations, revolve, again with the same face to the sun. In either case there would be no periodic changes but eternal day and night, respectively, on the sides turned towards, and away from, the luminary.

Some of the arguments advanced by the correspondents are ingenious and not a few comical. None, however, are valid.

One of the writers imagines the earth in the center of a circular orbital plate, having fixedly attached to its periperal portion a disk-shaped moon, in frictional or geared engagement with another disk of the same diameter and freely rotatable on a pivot projecting from an arm entirely independent of the planetary system. The arm being held continuously parallel to itself, the pivoted disk, of course, is made to turn on its axis as the orbital plate is rotated. This is a well-known drive, and the rotation of the pivoted disk is as palpable a fact as that of the orbital plate. But, the moon in this model only revolves about the center of the system *without the slightest angular displacement* on its own axis. The same is true of a cart-wheel to which this writer refers. So long as it advances on the earth's surface it turns on the axle in the true physical sense; when one of its spokes is always kept in a perpendicular position the wheel still *revolves* about the earth's center, *but axial rotation has ceased*. Those who think that it then still exists are laboring under an illusion.

An obvious fallacy is involved in the following abstract reasoning. The orbital plate is assumed to gradually shrink, so that finally the centers of the earth and the satellite coincide when the latter revolves simultaneously about its own and the earth's axis. We may reduce the earth to a mathematical point and the distance between the two planets to the radius of the moon without affecting the system in principle, but a further diminution of the distance is mani- (Cont. on p. 892)

WE believe the accompanying illustration and its explanation will dispel all doubts as to whether the moon rotates on its axis or not. Each of the balls, as M, depicts a different position of, and rotates exactly like, the moon keeping always the same face turned towards the center O, representing the earth.

But as you study this diagram, can you conceive that any of the balls turn on their axis? Plainly this is rendered physically impossible by the spokes. But if you are still unconvinced, Mr. Tesla's experimental proof will surely satisfy you. A body rotating on its axis must contain rotational energy. Now it is a fact, as Mr. Tesla shows, that no such energy is imparted to the ball as, for instance, to a projectile discharged from a gun. It is therefore evident that the moon, in which the gravitational attraction is substituted for a spoke, cannot rotate on its axis or, in other words, contain rotational energy. If the earth's attraction would suddenly cease and cause it to fly off in a tangent, the moon would have no other energy except that of translatory movement, and it would not spin like the ball.—Editor.

Experimental Physics

By JOHN J. FURIA, A. B., M. A., (Columbia University)

LESSON TWENTY (Conclusion)

PHYSICS AND THE WORLD WAR.

As a fitting conclusion to this series of articles, let us consider to what extent Physics helped to beat the Huns. The bulk of the wonderful work done by all branches of science has as yet not been disclosed to the general public; but the following material disclosed by Professor Ames, of Johns Hopkins University, in his address at the University of Virginia, by Dr. Hale in his address before the New York Engineering Societies, by Professor Millikan, of the University of Chicago, in his address at the Philadelphia meeting of the American Institute of Electrical Engineers, and by Major-General Squier in his address at the New York meeting of the A. I. E. E., is more than sufficient to make it evident to us that Science in general and Physics in particular, deserves a lion's share of the glory accruing from the victory of the Allies.

Wireless Telegraphy — It Often Proved the Only Reliable Communication in Battle.

The American public at the beginning of the war held its scientific men in insignificant regard, and was very much surprised to learn of the high degree of mobilization of Germany's scientific men for war work. The "fool professor" was destined to come before the public eye. On our entering the war our wizard inventors with their efficient press agents won the war for us over night by their epoch-making inventions. Days went by, but our epoch-making inventions did not appear, and gradually the usual murder and divorce cases appeared in the papers again, displacing the names and ideas of our wondrous newspaper wizards. An Inventions Board received some 1,600 inventions from our inventors and found about half a dozen of them were worth considering. Magnets of tremendous size were proposed, which when placed in the bottom of the sea would attract all shells, etc., and thus stop the war. Others proposed magnets of various forms, which on trailing along beneath an airplane would drag up any submerged invisible submarine. Another proposed generating a wind so strong that it would push away any approaching airplane, balloon, etc. Thus airplaine raids were eliminated, submarine attacks were ended, and the war was over. These fool inventions were coming in so fast that the Board in self-defence determined not to consider any inventions sent in by these wonder-workers unless a "working model" accompanied the papers. It was evident that the road to a successful termination of the war lay in bringing together men possessing scientific knowledge, and equipt with scientific methods. In ordinary peace times the college professor is at a disadvantage —he is usually ignorant of, or not interested in commercial development, and does not come in contact with the technical trades. However, his researches in pure science are eventually commercialized and become of vast technical importance. In bringing together eminent scientists, presenting them with problems, showing them the conditions, having them perform their researches under the best of conditions and immediately making use of the fruit of their toil—this proved the way to victory. In Washington, London, Paris and Rome, some of the foremost of the Allied scientists were gathered. Among the Physicists we have Millikan, Ames, Mendenhall, Gale, Wood, Duff, Hubbard and others, all in uniform and commissioned as officers in the U. S. Army or Navy. Major-General G. O. Squier, the Chief Signal Officer of our army, is a Physicist of considerable reputation, having received his degree of Ph.D. in Physics at Johns Hopkins University. The rest of our Physicists served in civilian capacities.

Machine Guns — Another Weapon of Science, Worked Havoc to Both Sides Night and Day.

Giant Bombing Planes Were Threatening to Wipe Out Berlin When the Armistice Was Signed.

IN THE "MAY" EXPERIMENTER

The Editors have in preparation some exceptionally interesting articles for the May number of the ELECTRICAL EXPERIMENTER, *among which are the following:*

The Latest in Aërial Railways.

Electricity and Dynamite — How they help the farmer irrigate land, divert streams, loosen hard soil, and clear land of stumps and stones.

Recording Our Thoughts Electrically, by H. Gernsback.

New York to New Jersey Via Wagon and Auto Tunnel—A Gigantic Engineering Problem.

The Latest Electrical News from France, by Jacques Boyer, Paris Correspondent of the "E. E."

Springtime Fashions in Electric Fans—Several dozen new wrinkles with these useful devices that will interest the whole family.

X-Raying Our Teeth—How disease and mental ailments have been actually traced to ordinarily invisible infections of the teeth. Written by the Medical Director of a Prominent State Hospital.

How to Build a Professional Medical Induction Coil Outfit, by H. Winfield Secor.

Some Interesting Facts Concerning the Electron, by L. R. Jewett.

How to Build an Efficient Open-core Step-up Transformer, by William Holladay.

Choke Coils—How to compute their dimensions with data on actual coils, by Prof. F. E. Austin, Instructor of Electrical Engineering, Dartmouth College.

"Science in Slang" — Installment No. 3, by Emerson Easterling.

Let us now see how our war needs affected scientific research. It is a well-known property of charcoal that it has a high absorbing power for many gases. When the Huns brought forth their little surprise of "poisonous gas," the gas mask was immediately evolved. Research developed that a special treatment of charcoal, made in certain sizes from special kinds of wood had an increased absorbing power. The Physicist knew that charcoal had this absorbing power, and when the problem of increasing this power to make the combating of gas warfare more efficient was proposed, the problem was solved. Airplane engines have been manufactured for many years, but never before has the necessity arisen for high speed quantity production. The problem arose and was solved, the Liberty engine was designed, developing 400 horse-power and weighing only 800 pounds; about 2,000 per month were manufactured. The resistance offered by the wings of different sections, the stability of the airplane, the character of the covering surfaces, etc., have all been investigated in detail. The instruments of navigation and of signaling are perhaps every bit as important as the airplane itself. Instruments for indicating speed, direction, height, distance travelled, etc., have all required extended and careful research by the Physicist. In all airplane work, whether in observations or in making attacks, it is necessary for the men in the machines and the men on the ground to be in constant communication. The wireless telephone is the obvious solution. Wireless telephony has no doubt made more progress in one month of war than in one year of peace. The modifications and improvements made in wireless telephony apparatus in America's physical laboratories by her scientists (most of which have as yet not been disclosed to the public) are positively epoch-making. Our improvements have made it possible

The Planet Earth as Others See Us

By ISABEL M. LEWIS
OF THE U. S. NAVAL OBSERVATORY

Copyright, 1919, by E. P. Co.

The Earth As It Appears to an Observer Stationed At the Moon, One of the Most Wonderful and Awe-Inspiring Objects of the Heavens. On the Moon, the Earth Appears Sixteen Times Larger Than the Moon Appears to Us On the Earth. The Sun Shown At the Right Illuminates Only Part of the Earth, Which Therefore Appears in Crescent Form. It Is, However, Not In Total Darkness for Some of the Light Is Reflected By the Moon Onto the Earth and Back to the Moon, Hence the Darkened Portion Is Not Entirely Dark, But the Continents Can Be Faintly Seen. There Being No Atmosphere On the Moon, the Sky Appears Dead Black In Day Time. The Sun Will Be Seen With Its Corona and Streamers Somewhat as Shown in This Illustration.

WERE it possible for us to view the heavens from the planet Mars we might see in the hours just following sunset or preceding dawn a most beautiful star of first magnitude rivaling and at times surpassing the great star Sirius in brilliancy, closely attended by a small companion star considerably less brilliant. The smaller body is evidently a satellite of the brighter one, as its position relative to the larger body changes in such a way as to show it is revolving around it. It appears now to the east, now to the west of the chief star. At their widest separations the two form a very distinct double star, unique in the heavens of the Martians. As the little star travels from one side to the other of the bright star it usually goes above or below it tho occasionally it passes directly in front of or behind the brighter body and at such times only one star is then visible to our Martian observers.

This lustrous double star, the morning or evening star of the Martians, is our planet Earth and its satellite the moon.

Were we observing our planet from Mars it would be quite beyond our powers of imagination to conceive that this tiny point of light, glowing by the reflected light of the sun, has been for ages upon ages the abode of species and forms of life of well nigh infinite variety that have existed under widely different conditions of temperature and pressure not only on the surface of the planet but in the depths of the seas that cover three-fourths of its surface.

We can imagine conservative scientists of Mars frowning at the flights of fancy of the Martians in regard to the nature of the inhabitants of this other world in space. Yet in their wildest speculations the Martians could hardly exaggerate the wonders of our planet Earth or the strength of the conflicting forces for good and evil to be found upon it.

Let us consider for a moment how our planet Earth and its satellite would appear were we able to examine it telescopically from Mars. Most of the difficulties that beset us here on earth in our attempts to observe Venus telescopically would be experienced in attempting to view the planet Earth from Mars. A reference to Fig. 1, which shows the relative positions of the three planets, will make this clear. The earth's orbit lies between Mars' orbit and the sun, just as the orbit of Venus lies between us and the sun. As we will see later, Venus has a decided advantage over Mars for observations of the planet Earth. On Venus and on our own planet, Mars can be seen in opposition to the sun that is on the Meridian at midnight, with its disk fully illuminated like the full moon. To Mars, on the contrary, all the inner planets, Mercury, Venus and Earth, appear as half or crescent moons telescopically when they are in the best position for observation and they never appear with fully illuminated disks.

When the earth is nearest to Mars, in position E_0, see Fig. 1, it is invisible to the Martians, just as Venus is invisible to us in the corresponding position, owing to the fact that it is then *in line with the sun* and lost in the glare of its light. This position is known as the planet's inferior conjunction with the sun. Just before and after the earth is in this position it would show a very thin crescent if viewed telescopically from Mars.

In the position E_2 the earth is once more in line with the sun and Mars in what is

www.americanradiohistory.com

known as superior conjunction, and is again invisible. Just before and after it is in this position its disk is like a gibbons moon almost entirely illuminated, but it is unfavorably situated for observations from Mars because it is so near the sun and on the far side of its orbit from Mars. In position E_4 and E_3 the earth is at its greatest distance from the sun, spoken of as its greatest eastern and western elongations, as seen from Mars. It is then a half-moon in the telescope, is at its highest elevation above the horizon and is evening or morning star to the Martians, according as it is east or west of the sun. We might expect that it would now be in its most favorable position for observation, but this is not so.

Looking at Fig. 1 we see that as the earth passes from the position E_3 toward inferior conjunction with the sun at E_0, its distance from Mars *decreases* and therefore the apparent size of its disk *increases*. The *form* of the illuminated portion now changes from half moon to crescent but the *total area* of the illuminated portion increases up to a certain point. When the area of the illuminated portion of the planet has its greatest value the brightness of the planet is at a maximum. The exact time when this will occur can be worked out mathematically. The best observations of the earth seen from Mars would be obtained when the planet is in this position and the corresponding one lying between inferior conjunction and western elongation. (See positions E' and E" in Fig. 1.) We can therefore imagine the Martians observing our planet at its best in the morning or evening twilight. The brilliancy of the earth in Martian skies at this time usually surpasses that of all other planets. Mercury and Venus, tho also evening and morning stars to the Martians, appear considerably less brilliant than they do to us. The earth appears to the Martians much as Venus does to the earth, tho less brilliant, owing to the fact that Venus comes nearer to the earth than the earth does to Mars. The only planet that may rival the earth at the time of its maximum brightness is the giant planet Jupiter, which appears at times brighter to the Martians than does our own planet.

In their telescopic observations of the earth the Martians would experience the same difficulty that we experience in our observations of Venus. When the planet is in its most favorable positions for observation the greater part of its disk is darkened, owing to the fact that the phase is the same as that of the crescent moon.

The Martians, however, would not be handicapped by a dense cloud-ladened atmosphere such as surrounds Venus and makes it so difficult for us to observe. As the earth's diameter is twice that of Mars, our surface markings would appear considerably more extensive to the Martians than the markings on Mars appear to us, tho drifting clouds and snow storms on our planet would frequently hide temporarily some of the markings on our planetary disk.

We can imagine the Martians puzzling over our seas and continents and largest islands and lakes, our polar snow caps and tropical vegetation showing in green and grey-green splatches, our reddish-tinted deserts, our mountains and our great level plains just as we puzzle over the canal-system and the desert and marshy tracts on the planet Mars.

The fact that our planet rotates on its axis in twenty-four hours and has marked seasonable changes could be as readily determined from the distance of Mars as the seasonal changes and rotation of Mars on its axis have been determined by us. We can imagine the interest that our large satellite would arouse and the speculations that would be made concerning its indistinct surface markings. In one respect the Martians would have an advantage over us in their observations of the moon. They would be able to examine one side of the moon that we have never seen. The side of the moon that is never turned toward the earth would be visible frequently to the Martians.

Fig. 4. The Earth As Seen from Mars. At the Time of Its Greatest Brilliancy the Earth Appears As a Crescent to the Martians. To Better Understand This See Figs. 2 and 5. To the Martians the Planet Earth Can Never Be Viewed As a Full Disc—Only In Crescent Form. When Entirely Illuminated By the Sun, It Is Lost In Its Rays and Is Therefore Invisible to the Martians

The Planet Earth and Its Satellite the Moon As It Appears Among the Stars When In Opposition to the Sun, Viewed from the Planet Venus

Let us now consider how our planet would appear if we were stationed on the planet Venus, assuming that it is possible at times to see the beauties of the starry heavens thru occasional rifts in dense clouds that apparently shut the surface of this interesting planet almost completely away from the universe beyond.

Seen telescopically at the time of its opposition to the sun, the planet Earth and its satellite the moon would be for the inhabitants of Venus the most beautiful and interesting object in the heavens. No planet appears to any other planet as magnificent as the Earth-Moon system does to Venus at the time of nearest approach. The brilliancy of the earth seen from Venus at this time is twice that of Venus as it appears to us at its best. As the earth's disk is then fully illuminated the inhabitants of Venus would have a great advantage over the inhabitants of Mars in their study of the surface markings of our planet. Objects on the earth's surface fifty miles in diameter could be made out easily by the inhabitants of Venus with the assistance of such telescopes as we employ for the observations of the planets. When Mars is most favorably situated for observation from the earth the diameter of its disk is between fifteen and twenty-five seconds of arc, according to its distance from the earth at the time of opposition. When the earth is most favorably situated for observations from Venus the diameter of its disk is sixty-three seconds of arc and that of the moon is seventeen seconds of arc. So even the disk of our moon appears at certain times as large seen from Venus as the disk of Mars seen from the earth. The markings on the earth itself seen from Venus stand out more distinctly at opposition than the markings on Mars do to us at the most favorable opposition of Mars as we are nearer to Venus than to Mars.

It is when we take our station on our own little satellite, however, that we behold our planet earth as the ancients wished to consider it—the most wonderful and awe-inspiring object in the heavens. To the inhabitants of the moon, were there such, the earth's disk would appear four times greater in diameter and *sixteen times greater in area than the moon's disk appears to us.* Since the moon, in its revolutions around the planet Earth, always keeps the same face turned toward it, *the position of the earth,* for any one point of observation on the moon, *remains immovable in the heavens,* and it goes thru the various phases of its illumination by the sun in the reverse order to that followed by the moon. When the moon appears to us to pass from new to full the earth appears to the moon to pass from full to new and vice versa.

The rotation of the earth on its axis is plainly visible from the moon even to the naked eye. A distinctive marking will appear at the western edge of the earth's disk, say the Black Sea or Central America. It will be carried gradually eastward by the rotation of the planet and will finally disappear twelve hours later at the eastern edge.

Oceans and continents and polar caps appear in their general outlines and contrasting shades, visible easily to the naked

Radiophony to Airplanes a Great Success

A CONSIDERABLE time before the United States entered the world war the Bell Telephone system supplied the American Navy with a wireless telephone outfit designed for communication between an airplane and a station on land or on a ship. From that time on until this country entered the world-conflict, the Western Electric Company, as a part of its general study, conducted the work of perfecting light, compact wireless telephone sets, which would be available on small vessels and on airplanes. The first successful wireless test between an airplane and the ground after our entry into the war was made with one of the sets designed and completely built by this enterprising engineering organization prior to our entry into the war. The test was made on Langley Field.

U. S. Army Airplane Pilot and Observer Equipt with Wireless Telephone Sets for Transmitting as well as Receiving Speech. These Sets Are Provided with a Change-over Switch Which Permits the Instruments to Be Utilized as a Regular Telephone Between the Two Birdmen.

On May 22, 1917, Gen. George O. Squier, Chief Signal Officer of the United States Army, sent for Dr. F. B. Jewett, chief engineer of the Western Electric Company, to confer with him with reference to the matter of equipping airplanes with wireless telephone apparatus. At this conference, which was held in Washington, besides Gen. Squier and Dr. Jewett, there were present E. D. Craft, one of Dr. Jewett's principal assistants; Capt., now Col. C. C. Culver, of the Signal Corps, and Col. Rees, of the British Army Air Service. The possibility of providing airplanes with wireless telephone service was discust, and the reports of the development work being done by the Western Electric Company made by Dr. Jewett were so promising that he was ordered in writing by Gen. Squier to proceed with the development of the system, and to actually equip 'planes with it.

The Bell system engineers had progrest so far at that time that they were able on July 1, 1917, five weeks after the first conference, in a test at Langley Field, to actually demonstrate the working of the wireless telephone between an airplane and the ground. This test also showed that it was practical to operate the system between two or more airplanes in the air.

"All this sounds very simple, but it would take volumes to describe the innumerable experiments and heart-breaking failures before the first real successes. So far as the radio part of the equipment was concerned we had an answer in a short time. We had developed some very successful forms of vacuum tubes and it was a simple matter to assemble them with the necessary coils, condensers and other apparatus that comprise the transmitting and receiving elements. Working this apparatus under ordinary conditions on the ground, and in a swift-moving and tremendously noisy airplane, were two entirely different propositions. The noise of the engine and rushing air was such that it was impossible to hear one's own voice, to say nothing of the weak signals of the telephone receiver," stated Edward B. Craft, Assistant Chief Engineer of the Western Electric Co.

One of the first problems was to design a head set which would exclude these noises, and at the same time permit of the reception of the telephone talk. A form of aviator's helmet was devised with telephone receivers inserted to fit the ears of the pilot or observer. See accompanying illustration of the helmet with 'phones complete. Cushions and pads were provided for adjusting the receivers to the ears and the helmet fitted close to the face so as to prevent as far as possible, the sound being heard either thru the ear passage or thru the bony structure of the head, which acts as a sort of a sounding board. A helmet, such as that illustrated, was finally developed and was found to solve this portion of the problem. The earpiece finally adopted was made of sponge rubber (made so by blowing air thru it while molten), reënforced by tinfoil, and the receivers themselves embedded therein. These were mounted in a thick leather helmet, to be clamped over the flier's head and ears. It effectually muffles bone transmission also, besides permitting the use of oxygen or gas masks.

Everyone knows how sensitive the ordinary telephone transmitter is to extraneous noises, and it does not require a wide stretch of the imagination to picture how this would act alongside the exhaust of a 200 horsepower gasoline engine. A brilliant line of experimentation finally resulted in a form of a telephone transmitter or microphone, which possest the remarkable quality of being insensitive to engine and

www.americanradiohistory.com

wind noises, and at the same time very responsive to the tones of the voice. With these two elements in hand, the problem was apparently solved. The fact remains, however, that three solid months of the hardest kind of work was necessary to iron out all the kinks and get the thing in shape so that it might be considered a practicable device for the everyday use of other than experts, as Mr. Craft points out. The microphone perfected for this work has no mouthpiece, but instead a flat cap having three tiny openings about 1/16 inch in diameter. The voice waves pass thru these onto the diafram easily, but the engine noises swirl round it in other directions and do not enter in sufficient volume to be heard at all.

A typical performance of the radiophone between 'planes and ground will prove of interest. Here is the way it worked at one of the first official army tests at the flying field at Dayton, Ohio, December, 1917, as related by Mr. Craft.

"The 'planes left the ground and after what seemed to be an interminable length of time, we got the first sounds in the receiver, which indicated that they were ready

The Vacuum Tubes Which Do the Work in Radiophoning to and from Airplanes and the Ground. At the Left—the Transmitting Tube; at Right—the Receiving Tube. America Was Turning Out These Bulbs by Thousands Every Day When the Armistice Was Signed, so Rapid Had the Standardization and Production Progress.

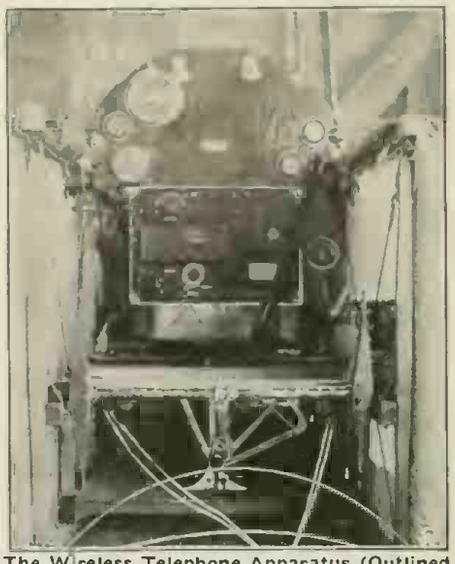
to perform. The spectators were only mildly interested, and some seemed to be a bit bored. Suddenly out of the horn of the loud speaker came the words, "Hello, ground station. This is 'plane No. 1 speaking. Do you get me all right?" The bored expression immediately faded, and looks of amazement came over their faces. Soon we got the same signal from No. 2, and the show was on. Under command from the ground the 'planes were maneuvered all over that part of the country. They were sent on scouting expeditions and reported what they saw as they traveled thru the air. Continuous conversation was carried on, even when the 'planes were out of sight, and finally upon command they came flying back out of space and landed as directed."

Electric current must be supplied to operate the wireless set on the 'plane, as we well know, this current being used to heat the filaments of the vacuum tubes and to operate the transmitter. But the 'planes were already loaded down with all the gear they could carry, and the use of heavy storage batteries was out of the question. The airplane engineers would allow nothing to be connected to their engines, so there was nothing left but to supply a separate radio dynamo, and drive it by a wind propeller, taking its power from the rushing air. Airplanes are in the habit of flying at various speeds, and the specifications stated this to be from forty to one hundred and sixty miles per hour, the latter figure representing the speed when the machine was diving. The little dynamo, therefore, had to deliver a constant voltage with a speed varying from 4,000 to 14,000 R.P.M.

In our next issue will appear an important article by Nikola Tesla entitled

"TRUE WIRELESS"

In this article Dr. Tesla will make known his views of the propagation of the wireless waves.



The microphone and receivers used for radiophoning from 'plane to 'plane or 'plane to earth are arranged by means of a switch so that the pilot and observer can converse over the telephone circuit between the pilot and his mechanician with ease, and by throwing a switch can connect themselves with the radio apparatus and talk with the men in another 'plane three or four miles away, or to the ground.

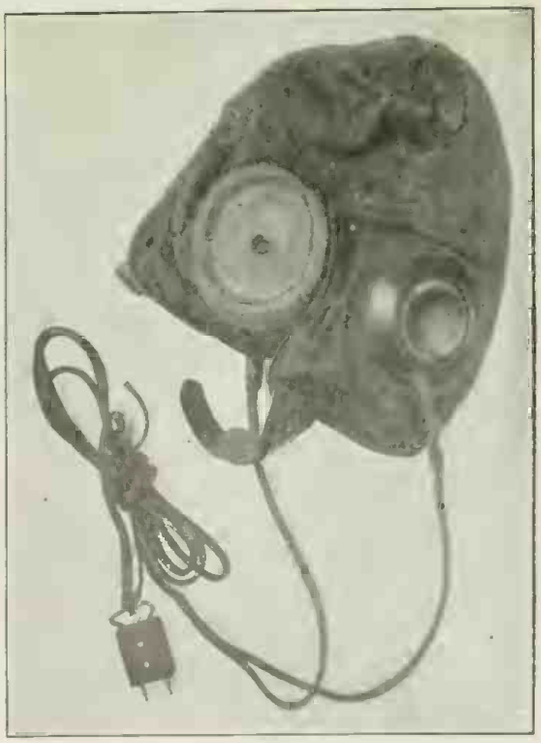
The primary object was to make it possible for the commander of an air squadron to control the movement of his men in the air, the same as a squad leader of infantry does on the ground. For this purpose extra long range is not required, and the distance over which they can talk is purposely limited to two or three miles, so that the enemy cannot overhear, except when actually engaged in combat, and then nobody cares.

The Navy also makes use of these sets in their seaplanes, and here the range is somewhat greater, up to twenty miles in some cases. The Navy has also made use of a modified form of this set in their 110-foot submarine chasers. The chasers hunt submarines in packs, and by means of the radio telephone, their commanders keep in constant touch with each other, thereby greatly increasing the effectiveness of their operation.

Finally, with the formal demonstration completed, pressure was immediately applied to produce the necessary quantity of sets with their multitude of auxiliary and subsidiary parts. From January 1, 1918, to the early summer of that year the Western Electric Company established factories and trained thousands of operatives so that when the armistice was signed the necessary transmitting and receiving tubes for radio telephone sets were being produced at a rate in excess of a million and a half good tubes per year. Improvement in vacuum pumps has resulted in a wonderfully high degree of exhaustion being attained—about one-billionth of an atmosphere.

Altogether thousands of radio telephone sets of different types have been manufactured and delivered to the Army and Navy since the early part of 1918. In spite of the fact that prior to July, 1917, no commercial types of this apparatus were in existence, and some of the fundamental problems had not yet been solved, the resources of this great telephone engineering organization were sufficient to establish

The Wireless Telephone Apparatus (Outlined in White Square) Installed in Cock-pit of Airplane. It Takes up But Little Room and Has Such a Small Weight as to Be Insignificant, Compared to the Lifting Power of the Plane.



on a commercial basis, within this short space of time, practically speaking, *an entirely new art!—Photos Courtesy W. E. Co.*

HOW AIRPLANES FIND THEMSELVES BY RADIO.

In his recent lecture before the American Institute of Electrical Engineers at New York Major-Gen. G. O. Squier, in connection with his description of the war's developments in radio apparatus, spoke as follows concerning the problem of aërial navigation:

"One of the principal problems of airplane navigation has been the evolution of a suitable compass, particularly for night bombing work. Magnetic and gyroscopic compasses have limitations at present which make impossible reliable air navigation by dead reckoning.

Do Radio Waves Travel Above the Earth or Thru It?

By DR. LEE de FOREST

(Written exclusively for the Electrical Experimenter)

THE article on "Radio Around the World" is very interesting. From my own rather extended experience and based also on the calculations and results obtained by most of the serious workers in this field, I think there can be no doubt but that the *etheric wave* component is by far the more important one. Understand, however, that these are not ordinary space waves, *but are grounded waves gliding over the surface of the earth*, thus following the contour of the earth. See Fig. 1. The depth of the wave in the ground or sea water has been shown by actual measurements, as well as by theoretical calculations, to be ordinarily and until recently only a few feet; sufficient, however, to explain the interesting results obtained with an horizontal antenna lying close to the surface of the earth, or even in trenches a few inches below the surface and extending, of course, in the general direction of wave propagation.

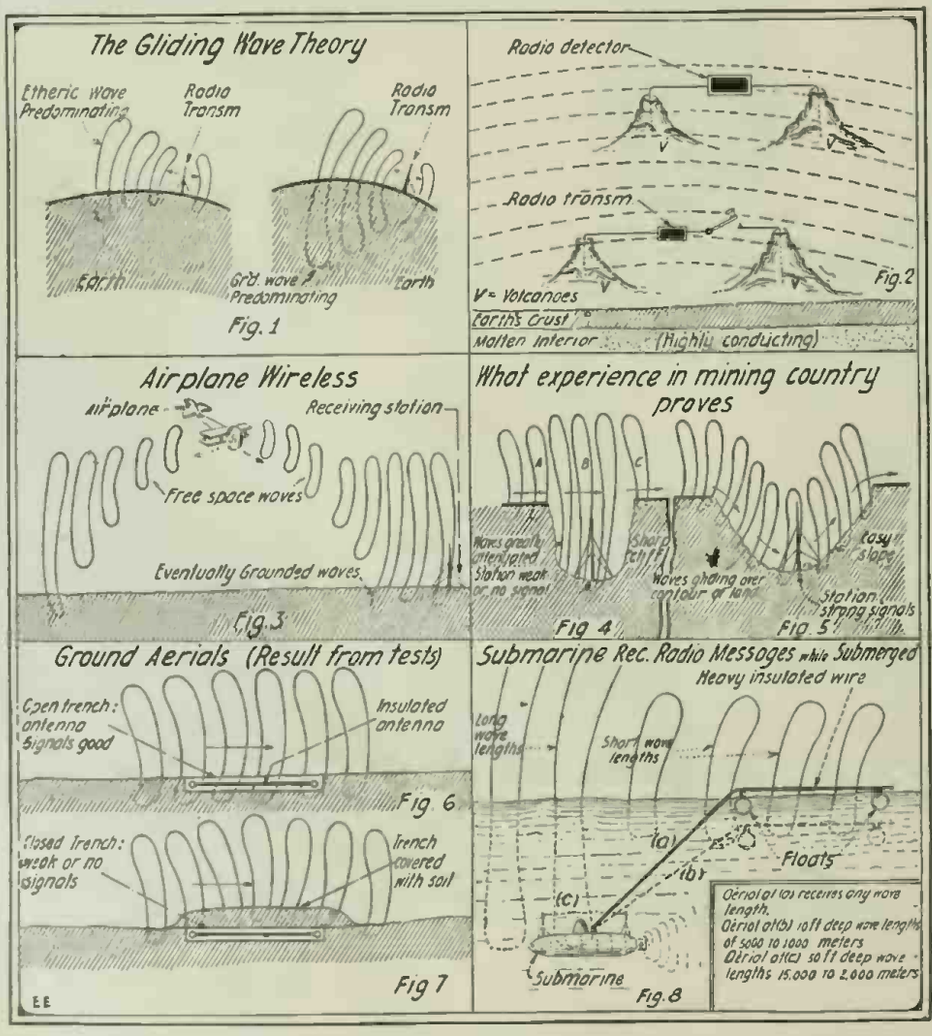
Unquestionably the molten interior of the earth would conduct low frequency oscillations with comparatively little loss, but it is obviously impossible to make connection to this molten interior, ordinarily. If one cared to experiment with two volcanoes at a comparatively short distance apart, making each crater the terminus of a line connecting with the terminals of an A. C. generator, and at some distant spot of the earth's surface between two neighboring volcanoes another parallel wire, in which a tuning and detecting device was located, very interesting results might be obtained. See Fig. 2.

However, if such a combination could be found there would probably exist not the slightest excuse for sending telegrams between stations thus situated. Unfortunately, or fortunately, we cannot locate our volcanoes as we would subway tubes.

If, as you suggest, a powerful wireless station could be operated at a sufficient distance from the earth's surface, and completely isolated therefrom, remarkable distances of transmission thru the ether might be achieved. However the energy obtainable at the moon from a given output of energy transmitted near the earth's surface can be calculated, by inverse square law. It will be found that a tremendously powerful station would be required to transmit signals to any such distance. You doubtless are aware of the remarkable distances obtainable from airplanes to the earth, using comparatively small transmitters. Just recently an army airplane carried on radio communication successfully over a distance of 150 miles. The distances are usually much greater than where a similar transmitter is located on the earth's surface, using a similar length of antenna.

The phenomena involved in such transmission, where the airplane is, say, two miles above the earth's surface, are doubtless complex. Here the ground wave is originally a *free space spherical wave*, but when the surface of this wave reaches the earth it doubtless cuts into the earth for a small depth and becomes then a true *grounded wave*, just as if it originated from an earthed antenna. See Fig. 3. There is great need for interesting data on the phenomena of transmission from airplanes and whoever will collect and publish such data will be conferring a great service to the Radio Art.

Concerning your question as to whether the wireless waves travel or glide along the surface of the earth in the manner which I have described above, each wave having a grounded foot or base penerating a short distance into the earth, I might mention a very interesting phenomenon which we have encountered in installing wireless stations in mountainous or mining country in the western part of the United States. Figs. 4 and 5 illustrate this phenomenon. Fig. 4 shows a case which often happened in the early commercial days of radio-telegraphy, where a mine owner or other party wished to install a station in a valley or cañon, which happened to have sharply rising cliffs on either side. Apparently the composite etheric and ground waves became so stretched out or attenuated in their effort to leap across this valley, that the station was only able to intercept either very weak signals or no signals at all. Therefore it was found advisable in-



(Cont. on page 919)

THE editors sent a copy of the article published in the December issue of the ELECTRICAL EXPERIMENTER entitled "Radio Around the World," and also the editorial in that issue by Mr. H. Gernsback, covering several interesting and more or less doubtful theories concerning the propagation of these electric waves over a distance of 12,000 miles, i.e. between Carnarvon, Wales, England and Sydney, Australia, to Dr. Lee de Forest, the prominent American radio engineer and scientist. The editors asked Dr. de Forest the following questions:

First: What is your opinion concerning the etheric wave transmission above the surface of the earth, i.e., free space wave propagation? Do you believe that the etheric wave wireless transmission is better beyond the computed fifty mile atmospheric envelope surrounding the earth, and how far into interstellar space do you believe these signals might be carried? Imagine for the moment that an airship fitted with sensitive wireless receiving instruments could have traveled away from the earth for any desired distance? Do you think these waves would be felt on the moon, approximately 238,000 miles distant, considering of course that suitable receiving instruments were available at that point?

Second: What is your opinion concerning the ground wave transmission, i.e., do you believe, with the geologists and others, that the earth presumably being a molten mass in the interior, might be a better conductor than the soil and rock crust surrounding it, and that this gaseous interior of the earth might therefore prove a better conductor than the soil and rock strata, and thus that the ground radio wave may have traveled directly thru the earth or a distance of nearly eight thousand miles—corresponding to the diametrical axis—or do you believe it much more likely that these ground waves followed around the curvature of the earth in the manner explained by Prof. J. Zenneck and other investigators, each ground wave gliding over the surface of the earth?

Third: Is it your opinion at the present day that the pure etheric space wave, gliding over the earth in accordance with the generally accepted theories concerning radio transmission, is the predominating wave, both as to electrical energy involved and amplitude, compared to the ground wave; or is the ground wave superior in its energy component and amplitude? These conditions are shown in one of the following diagrams, Fig. 1, and we would request your opinion on the relative extent above and below the surface of the earth, of the space wave and the ground wave respectively.

Various Phases of Gliding Wave Wireless Transmission Used In Discussion Here Given. In General, the Etheric Space Wave Glides along the Surface of the Earth, Accompanied by Its Grounded or Foot Wave.

Aërial or Ground Radio—Which?

The Opinions of Two Leading Wireless Experts

Do Radio Waves Travel Above the Earth or Thru It?—by Dr. L. W. Austin, Radio Expert, U. S. Naval Radio Laboratory.

REPLYING to your queries of recent date, I am very glad that you have asked these questions and will answer them to the best of my ability.

Q-1. I see no reason to doubt the validity of the old theory of wireless transmission which supposes a wave in ether (and under certain circumstances in the upper layers of the earth, provided they are sufficiently bad conductors), the lower ends of the electric lines being grounded on the conducting surface. The space wave under most circumstances certainly carries the *greater* part of the energy, except where the wave front is bent very far forward. This theory, it seems to me, is sufficiently proven by quantitative observations on received radio current which at moderate distances always agree within a few per cent with the theory that the antenna produces a field corresponding to a Hertz oscillator of twice its length.

Q-2. I believe that the currents in the earth are only incidental to the presence of the ether waves.

Q-3. In the case of transmission between airplanes and the earth, the phenomenon is similar. In sending from a 'plane, the wave must start as a *pure ether wave* which spreads downward and *grounds itself*, and then spreads out longitudinally (with a more or less bent wave front) very much like the wave from a grounded antenna.

Q-4. In antennas close to the ground or buried in the ground which, by the way, behave exactly alike except for a slight difference in static-signal ratio, the reception is accomplished by picking up the earth currents produced by the wave. These, of course, become relatively more powerful at greater distances from the sending station, owing to the usual bending forward of the wave front. The sending from earth or buried antennas is probably accomplished as follows:

In the first place, *ground currents* are formed which produce an electric field in the ether above the earth's surface. This field in spreading out and upward gradually rights itself and travels off very much like the field from an antenna, except that it is *directive.*

Q-5. I do not believe that it is probable that any wireless radiation passes thru the Heaviside layer. (Ed. Note: This would seem to eliminate the "Mars" radio story which has been going the rounds of the daily press.)

Q-6. Experiments indicate that *long waves* can be detected at *greater depths* than short ones, as would be expected from the ordinary skin effect phenomenon of alternating currents.

I am very sorry I have to disagree with Mr. Tesla in this matter, for I consider him the father of wireless telegraphy. His lectures in the early '90s contain full descriptions of a wireless system superior to anything which we actually had in practise before 1910, except for the lack of a proper detector.

Here Are the Questions the Editors Submitted

Q. 1. Do you believe that wireless transmission is effected by complex ether waves having a grounded foot, these waves gliding over the surface of the earth from the antenna, and if so:

(a) Do you think that the etheric space wave above the ground is the predominating one in energy component and amplitude?—or

(b) Do you believe that the ground wave component is the predominating one in energy component and amplitude?

Q. 2. Do you believe that underground wireless transmission is effected by means of ground impulses or currents radiating thru the earth from the base of the antenna, and that the etheric space wave radiation from the antenna is merely an incidental and separate phenomenon, which dissipates itself at a comparatively short distance of a few hundred miles or so?

Q. 3. Do you not believe in this general direction of thought on the matter, that it is the etheric space wave radiation from the antenna that accounts entirely for airplane radio transmission; either 'plane to 'plane, 'plane to earth, or earth to 'plane communication?

Q. 4. How do you account for the results obtained with the Rogers underground and undersea radio transmission and reception? Do you believe that this is accomplished by the grounded components or "feet" of the gliding etheric space waves in conformity with the usual theory accepted theretofore by the Hertzian wave school, or do you think that it is due to ground impulses or high frequency oscillating currents propagated thru the conducting shell of the earth?

Q. 5.—Do you think that, all things considered, and in the light of present day radio developments, such as the Rogers underground and undersea system, that radio transmission would take place with higher efficiency in free interplanetary space, or do you believe that our wireless signals produced at stations on the earth are retained within the atmospheric envelope of the earth due to reflection from the "Heaviside" ionization layer?

Q. 6. It has been hinted at by several naval radio experts and others that it has recently been found that the penetration of the ground wave component in radio transmission increases with increase in wave length, and this phenomenon they are inclined to believe accounts for the results obtained with the underground system. Do you believe this to be a fact?

How I Believe Radio Wave Transmission Is Accomplished

By F. H. KROGER

Chief Engineer, International Radio Telegraph Co., Formerly Chief Engineer, National Electric Signaling Co.

IN response to the request of the Editors of the ELECTRICAL EXPERIMENTER, I give below my replies to the questions here submitted:

Q-1. Practically all the energy delivered by the radio transmitter is radiated in the form of waves *gliding on the earth's surface.* Any energy which may be found to exist in the earth's surface is supplied by the waves sent out from the antenna. The *poorer the conductivity* of this surface, the more energy is taken from the wave, and consequently the less there is available at the receiving station.

Q-2. There must exist in the earth's surface, currents at the feet of the waves referred to in question number one. Means for detecting these currents will give a method of receiving messages. These currents, however, represent only a small per cent of the energy of the traveling wave. It is quite generally agreed that the wave above the surface cannot exist without the current in the surface and vice versa.

Q-3. Yes.

Q-4. Currents due to the gliding wave.

Q-5. The "Heaviside" ionization layer must be a boundary to the waves. One of the explanations of the marvelous work done in the North during the winter is the fact that the ionized layer of the Aurora, coming close to the earth, provides a boundary to the waves which prevents the usual attenuation.

Q-6. The ground losses are higher with longer wave-lengths for poorly conducting earth, in the vicinity of the antenna, which indicates that a greater volume of the earth is affected by the currents. This greater penetration would also hold for the gliding wave. Ground tests made some years ago indicated that the ability to receive signals *did not depend* upon the quality of the ground nor the wave-length: therefore Mr. Rogers' system probably does not depend upon a penetration due particularly to long wave-lengths, but upon a penetration which is sufficient for his purposes, given by any wave-length.

EXAMINATIONS FOR AMATEUR FIRST GRADE RADIO OPERATOR'S LICENSE AT NEW YORK.

Examinations for amateur first grade radio operator's license are being given at Room 603, Custom House, Bowling Green, New York City, every day after 9 a. m., announces Charles D. Guthrie, Radio Inspector of that district.

Attention is called to the fact that applicants for amateur first grade radio operator's license must qualify in the transmission and reception of Continental Morse code at the rate of *ten words per minute* instead of five as heretofore.

Papers covering these examinations will be rated by the examining officer as soon after the examination as possible *but no licenses will be issued until amateur stations are permitted to operate.*

PLEASE NOTE: By taking this examination authority is NOT granted to open your station. It will be necessary after the stations are authorized to open, to furnish on form 762, Applicant's Description of Apparatus, the particulars required and await the issuance of station license as well as the operator's license before operating the station and form 762 cannot be filled in and filed until the station has been made ready for operation as it is important that the exact dimensions of the antenna and the amount of power to be used be stated in this application.

You are hereby cautioned that it is unlawful to operate an unlicensed station, and all amateur licenses (operator's and station) issued prior to the war are now void.

When authority is granted to issue amateur licenses, new station numbers and call letters will be given.

CHAS. D. GUTHRIE,
Radio Inspector.

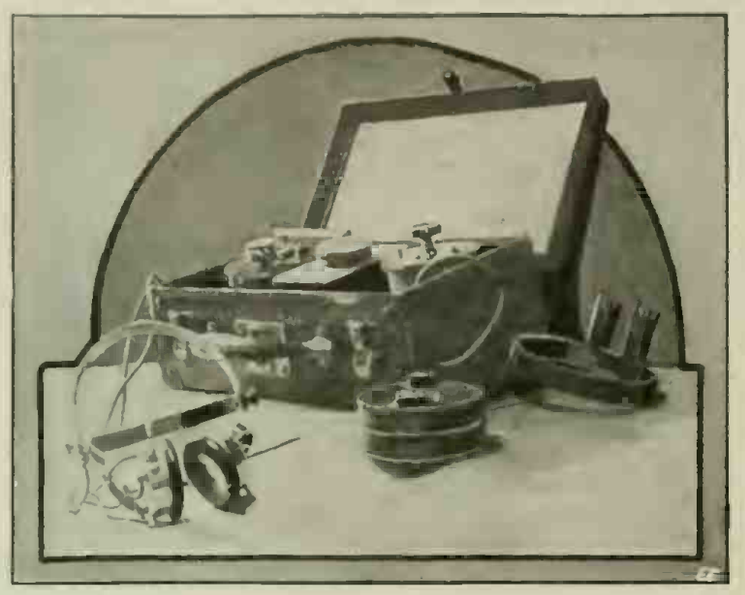
www.americanradiohistory.com

The How and Why of Radio Apparatus

By H. WINFIELD SECOR

No. 11. How to Make and Use a Direct-Reading Wave Meter and Decremeter.

From time to time we will describe one particular instrument used in either the radio transmitting or receiving set, explaining just how it works, and why. We have received so many requests from new readers asking for such explanations that we have decided to publish this matter in seriol form. In the course of several issues all of the principal transmitting and receiving apparatus will have been covered. The subject for the eleventh paper is HOW TO MAKE AND USE A DIRECT-READING WAVE METER AND DECREMETER.



THE present time seems an opportune one for the radio student and the radio amateur to prepare for the forthcoming opening of experimental radio opportunities, and we believe that no better use can be made of the spare time than to construct and study the use of the *wave meter and decremeter*. The accompanying text and illustrations show how to build a home-made wave meter which will give very satisfactory service. The dimensions given for the various parts of the instruments are taken from an experimental one which was carefully calibrated for the writer.

We will first take up the construction of the wave meter and will afterward consider the calibration curves to be used with it, and also the determination of decrement.

Perhaps the first part of the instrument that will come to hand as the student sets about the building of it, is the *inductance*, or rather the inductances. These coils are also referred to as the *exploring coils* or exploring inductances. They are used to pick up sufficient energy from a radio transmitter or receiving set, so as to cause oscillations to be set up in the wave meter circuit, which will be of sufficient strength to give a positive indication of resonance or non-resonance of the circuit, and thus to determine the exact period at which the current being measured is oscillating.

The illustration, Fig. 1, gives the details of construction for the three inductances used with this wavemeter. The wooden forms on which the coils are wound are best turned on the lathe from some fine grained hard wood such as mahogany or maple. The physical dimensions of the forms are given in the drawing and the length A, of each of the three coils varies with the number of turns on each, the table in the figure providing these values for the different coils. The winding in each case consists of one layer of No. 20 B. & S. gage enameled magnet wire. These inductances have been accurately calibrated by comparison with a standard wave meter at the Radio Standardization Laboratory of the College of the City of New York, thru the courtesy of Dr. Alfred N. Goldsmith, Director, and the specifications for building these coils must be rigidly adhered to. Where the accuracy of the instrument within a few per cent below or above the calibrated values is not imperative, No. 20 gage magnet wire, covered with a single winding of silk may be used; but due to the peculiar qualities of enameled magnet wire and the number of turns per inch of winding, etc., it will be seen that the specifications here given should be carefully followed to obtain the inductance values in centimeters here given. The three coils, numbers 1, 2 and 3, have inductances of 36,000, 126,000 and 259,000 centimeters respectively.

The manner of attaching the inductance coils to the wave meter cabinet is shown at Fig. 1, and consists of two lugs made of 1/16 inch brass and having slots at the lower ends of each. This enables the operator to slip the coils on and off the binding posts quickly. The inner and outer leads from the winding of the inductance should be carried thru diagonally drilled holes in the wooden form, as is indicated by the dotted lines, and they should be soldered to the two brass lugs, which are screwed to the form by means of small flat-head brass wood screws. The wooden form may be varnished or shellacked before winding, but the winding itself should not receive any coating of shellac or varnish, as this changes the distributed capacity of the coil. Do not use any iron in building these inductances.
